FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, JULY 4, 1903

VOL. LXI.—No. 1.
No. 846 BROADWAY, NEW YORK

For my own part, I wish the Bald Eagle had not been chosen as the representative of our country; he is a bird of bad moral character; he does not get his living honestly. . . With all his injustice, he is never in good case, but, like those among men who live by sharpening and robbing, he is generally poor, and often very lousy. Besides, he is a rank coward. . . I am, on this account, not displeased that the figure is not known as a Bald Eagle, but looks more like a turkey. For, in truth, the turkey is, in comparison a much more respectable bird, and withal a true, original native of America. Eagles have been found in all countries, but the turkey was peculiar to ours. He is, besides (tho a little vain and silly, 'tis true, but none the worse emblem for that), a bird of courage, and would not hesitate to attack a grenadier of the British Guards, who should presume to invade his farmyard with a red coat on.—Benjamin Franklin.

RICH AND POOR.

THERE is a class of shallow thinkers and agitated fallers against the rich, who profess to see a boggy-nian in the wealthy sportsman, and to discover in his evil machinations the source of all legal restrictions on full license in sport. As thus the editor of the Caledonia (N. Y.) Advertiser:

"Gradually the wealthy men of the Empire State are getting the right to fish and hunt entirely in their own hands. The law passed by the Legislature of the State last winter and signed by the Governor, prohibits the sale of grouse and woodcock in this State at any time during the year. That is to say, that woodcock and grouse are only for wealthy men to hunt, as the poor classes are the market hunters. One hunts for the money that's in it, the other for what he terms sport and the good eating that's to follow. We admire the man who hunts for the money in it far the most."

If the Advertiser man knew more about it, he would recognize that the interests of the "wealthy man" and of "the man who hunts for the money in it" are identical. Game is a table luxury, it costs money, and as a general rule is served at expensive restaurants and hotels. If it were not a costly article, if the market hunter who kills it were not paid a good price for it, he would not be so eager to "hunt for the money in it." And because game is a luxury, its consumption is chiefly by the wealthy. The "poor" market hunter kills it, the "wealthy men of the Empire State" pay him for it. Neither the poor market hunter nor the wealthy bon vivant approves the law forbidding the traffic in game. Both share the opinion of the Advertiser man that game birds should be snared and ground-potted for market. If they had their way, the close season laws and the anti-snaring laws and the anti-sale laws would not be in force. That such laws are in operation is due to the fact that in New York, as in the majority of States, the public has come to a realizing sense that if the game is to be saved it must be kept out of the snares of "the man who hunts for the money in it" and off from the tables of "the wealthy men."

The statutes of which the Caledonia man makes plaint as class legislation are in the highest degree expressions of the principle of the greatest good to the greatest number. The men in this country who shoot and fish are the average men who make up the community. They are not all rich nor all poor. Some have ample means of money and leisure, others must count most carefully the cost in dollars and hours. Whatever their circumstances and station in life, all alike have the right to such enjoyment of stream and game cover as their individual opportunities will permit, and as may be compatible with the common interest. The game and fish laws are in principle and intent no respectors of persons. Their purpose is to conserve the game and the fish for the common use of all. But, as has frequently been said in these columns, the protective laws are most necessary and most beneficial in behalf of the man of limited means, the one who cannot afford to indulge in long distance railway fares, hotel bills and guide wages, but must find his sport in home fields and local waters. He, the sportsman who must hunt and fish near home, if at all, is the one who is most nearly concerned and most vitally interested in putting a stop to "hunting for the money in it." Why? Because there is not game enough for the market hunter and the men who hunt for sport. Because if the market hunter has his swing, making a business of taking game, he will clean out the covers so that there will be nothing left for the rest of us who chose to earn a living in some other way than by grouse-snaring, but who do desire for recreation to take a day off in the fields when the season comes around. Any system which insures to us

and to our children the continuance of these privileges which our fathers enjoyed is in the highest degree for the best good of all. Any other system, such as that which the Caledonia editor appears to favor, by giving over the birds to the market hunter and the patron of cold storage game vaults, robs the many for the few.

No intelligent observer of the trend and development of the fish and game legislation of the country during recent years can mistake its character. At no other period has the purpose been more definitely and clearly to establish beyond question the principle that the game and the privilege of taking it belong to the whole people, and will be secured to them, and not to any one selfish class.

THE GAME PRESERVE.

As a factor in the matters of modern sportmanship as they pertain to the use of the dog and gun in field shooting, the game preserve may be considered properly as a constant. It is an established institution of sportsmanship in the United States, as it is in Europe, and it has come to stay. Its permanency is indicated in many material ways. In Europe, in many countries, it has existed through generations far into the past, and no property right is more highly prized nor more jealously guarded. The fact that many European countries have monarchical forms of governments is irrelevant to the subject of private game preserves. They are a consequent to man's passionate fondness for the chase and the competition incidental to civilization. This fondness is a phenomenon of human nature universally, and therefore, in its origin, is independent of governments or conventions of any kind. There are certain principles of ownership, possession and enjoyment of property which are the same everywhere in civilization, and which, in civilization, become more and more affirmed with the passing years with the increased common sense of the common people as a whole.

In the United States the private game preserve did not have its origin in imitation of foreign methods of sportsmanship. It had its origin in accord with the natural laws of supply and demand. The natural game supply and available common areas of hunting grounds, once so abundant, became wholly inadequate to supply the demand. Artificial methods of game preservation were a necessity of the situation, if sport with dog and gun were to be secured to a reasonable certainty. In the United States, at the present time, the game preserve, as an institution of sportsmanship, is to be found in every section, is progressively enlarging with the passing of the years, is indorsed by men of all stations of life, of all degrees of financial standing, and is well within the natural rights of man and the laws of the land. A sentimental opposition to it avails nothing. The rights of the property owner existed as fully and forcibly through all the past years of free shooting everywhere as they do to-day; but owing to the circumstances of vast areas in a wild state and a superabundance of game, owners permitted their property rights to lie dormant. When they chose to assert their property rights, they introduced no new principles of ownership. There, however, was much to be thankful for during all the years of freedom to enjoy private property, rather than anything to resent when the freedom, by sufferance, ended.

The idea of the game preserve had its origin before the era of preserve ownership in a legal way. In the old days when a sportsman found a sequestered section abounding in game birds or fish, he carefully concealed its whereabouts, and year after year he enjoyed the fun and fruits of his superior knowledge. If anyone else discovered and invaded it, the original discoverer considered the other fellow as an offensive interloper. Herein lies all the principle of the game preserve, which had its origin in such primitive beginnings. What the ancient sportsman accomplished by stealthy secrecy and technical trespass, the modern sportsman accomplishes openly and legally as a matter of business under the universal laws of supply and demand, and instead of diminishing the area devoted to the game preserve will progressively increase till the available lands are all taken, or the general increase in land values shall act as a check.

In establishing and maintaining a game preserve, the sportsmen of the United States will be confronted with the same problems which exist in foreign countries. The preserves must be stocked and restocked if good shooting

is to be insured. Artificial methods of propagation will need to be resorted to, and methods to protect the game birds and fishes from marauders, whether man, dog or vermin, will be a constant necessity.

THE VAGRANT DOG IN THE GAME FIELD.

A FACTOR in the maintenance of the game supply of a region is the vagrant dog which is permitted to run at large in the cover in close season. It makes no difference whether the animal is well bred or a cur. A dog, when permitted to wander about at will, exercises many of his wild traits of a predatory nature. He has no perception whatever of property rights. He will chase rabbits with unbounded enjoyment. He will rob the nests of game birds, kill and eat the young quail and partridges, and besides he will harry and kill sheep. Hounds in particular are conspicuous offenders. They have an insatiable appetite, are eminently vagrant and predatory in their habits, and from their keen sense of smell, great endurance and skill in pack work, have superlative powers of predatory destructiveness. If they fail in their efforts to secure rabbits, the eggs of quail, partridges, hens, etc., they do not hesitate to invade cornfields when the corn is in the milk, tear it down and feed on it much after the manner of hogs. In the South the vagrant cur is particularly and offensively destructive. No owner has any right to permit his dog or dogs to run at large, and the more offensive or destructive vagrant dogs become, the less value will dogs have in the eye of the law. The vagrant dog is one of the chief problems which game preserve owners have to meet, but there is no doubt that, when it becomes serious enough, it will be fully settled, and not at all to the advantage of the dog.

In a suit brought by the New York Forest, Fish and Game Commission against one Dunston, a New York city restaurant keeper, to collect the penalty for the serving of four quail in his restaurant out of season, the lower court dismissed the case, on the ground that although the birds had been served to a customer of Dunston in Dunston's restaurant by Dunston's waiter, there was no evidence to show that they had ever been in Dunston's possession, and Dunston therefore could not be held liable. This appears to be a loophole as big as a barndoor through which restaurant keepers may pass cartloads of illegal game. The Appellate Term of the Superior Court has just sustained the action of the Municipal Court in dismissing the case, Mr. Justice Truax dissenting in an opinion of which this erudite and eloquent gustatory passage deserves to be engrossed on the records:

"I am as fond of quail, in season and out of season, à la broche, au laurier, aux petits pois, au gratin, aux laitues, en croustades, à l'anglais, aux truffes, à la poêle, à la cendre, aux écrevisses, sous la cendre, au salpicon, en compote, au basilic, aspic, chaud-froid, pâté chaud, bisque of quail, and in every other way, as is either one of my associates, but I cannot concur in the conclusion reached by them."

THE records of the Fourth of July casualties wrought by the toy pistol are again claiming space in the papers. The deadly nature of these instruments is well known; it has been demonstrated year after year by the sacrifice of lives. That the toy pistol has not already been abolished by statute is a disgrace to our day and civilization. The subject is one which should have the first practicable attention of legislators. The manufacture, sale and use of the article should be prohibited. If parents lack the sense to keep the things out of the hands of their children, the authorities should interfere. This annual slaughter of the innocents is no fitting way to commemorate the events of 1776.

THE coarse fish of the Nepigon have in recent years multiplied to such an extent that they have threatened to exterminate the trout for which the stream is famous. The authorities met the evil with vigorous action, and during the last season destroyed 1,800 pike, 389 pickerel and 803 suckers. Commissioner Bastedo urges the continued prosecution of the good work, and the value of the Nepigon trout fishery is of sufficient importance to warrant the most earnest effort to save it.

The Sportsman Tourist.

Some Old Time Plainsmen.

I.—Beaver Bill.

ALL the old timers knew Beaver Bill, and every one of them was his friend, because he was such a genial, generous, companionable man, and so undeniably brave. It matters not what his real name was; some of us knew it, knew where he was born and raised. He came of a good family back in an Eastern State, and there in his old age he returned, to pass his remaining days with an aged sister. I can imagine how he sat by the fireplace in the old homestead, smoking incessantly, thinking of his many adventures, and occasionally angrily thumping the floor when he felt an extra sharp twinge of rheumatism. And I am sure that he thought often of an Indian's prayer we once heard: "Let me not live, O sun, to become old and infirm, and racked with pain. Grant that I may die while life is still pleasant; that I may die bravely in battle, suddenly cut down by the foe."

Beaver often used to speak of that prayer. "There's a deal of sense in it," he would say, "a whole lot of philosophy. It's the way I want to go—while life is still pleasant, and quickly; I don't care how, except that I do not suffer."

Alas! The poor fellow suffered terribly for months and months before the end came.

One spring we two were floating down a tributary of the Missouri in quest of beaver. I had joined the old plainsman merely for the pleasure of the trip, and to learn something of the ways of the trapper and the trapped. It was a small stream we were running, and one day our boat brought up sharp in a wire fence which spanned it from bank to bank. "Fenced the creek!" Bill muttered. "Damned if they haven't! Pretty soon 't will be so that a man can't get to a stream without asking some rancher's permission to go through his field."

"Well, Bill," I said, "when that time comes you will not want to go through any fields, for the beaver will all be gone. As soon as the railroads are built into Montana all the streams will be settled upon. While you still have your choice of thousands of good locations, why don't you select one and become a rancher yourself?"

He looked at me in pained surprise. "I a rancher?" he exclaimed. "A rancher! getting up early in the morning and milking a lot of cows. Plodding along behind an old plow; mowing and stacking hay; cutting and threshing grain; going home every evening plumb petered out, too tired even to think, and tumbling into bed from the supper table. The same old round day after day, the same old grind year after year. And for what? That's what I want to know; for what? Is there any fun in such a life?"

"No, I can't say there is any fun in it; but it is such an independent life—the rancher is his own boss—"

"That shows how much you know about ranching," he interrupted. "The rancher isn't his own boss; he's the slave of his cattle, his fields, and he's the plaything of the weather and the markets. But worst of all, his life is as uneventful as that of his barnyard cattle."

In that brief denunciation of ranching, especially the last sentence, was explained the fascination the life of a trapper had for some men. They were as free as the air they breathed; they wanted constant change of environment and they had it. They loved to contemplate nature, and lived close to her breast. They wanted adventure, constant excitement, and they found it in matching their skill against the cunning of animals, in penetrating the hunting ground of hostile Indians at the risk of their lives.

None of the old time trappers I knew cared for the monetary returns of their occupation. They made large sums of money every season, from one to three thousand dollars; sometimes even more; but they spent it quickly, seemingly anxious to get rid of the burden and to return to the wilderness. And those others of a still more remote time, Jim Bridger and his contemporaries, who, following after Lewis and Clark, explored the whole Rocky Mountain region. They were trappers, but it was not the pursuit of the beaver that led them far across the plains and into the fastnesses of the mountains. It was their love for adventure; the beaver pelts merely provided the means for their expeditions into the great West. They were the men who informed the world that the Great American Desert was a myth, who blazed the Overland and Oregon Trails. They were the vanguard of the civilization which has in a few years penetrated to every nook and corner of half a continent.

The northwestern trappers pursued the beaver almost exclusively. There were martin, fisher, otter, wolverines and mink in the heavily timbered slopes of the mountains, but they were only to be taken by running long lines of traps on snowshoes during the cold winter months. The trappers had no relish for that sort of work; where they could go with pack and saddle horses, or by boat, the fur was safe. The vast number of beaver which inhabited the streams of the West was almost beyond belief. In their journal Lewis and Clark mention one place on the Upper Missouri where three acres of timber had been recently cut down by the busy animals. On all the small streams the remains of their dams are still to be seen. There is one on the Two Medicine River, at the western edge of the Blackfoot Reservation, which is half a mile long and about eight feet in height. What a tremendous undertaking it was for such small animals. Tons and tons of earth and stones, cord upon cord of tree cuttings, trunk, limbs and twigs were employed in its construction. And it was a fine piece of engineering work, for it extends from slope to slope of the valley as straight as a line could be surveyed. The dam backed up the waters of the creek for nearly a mile, and in the pond thus formed the beavers built their houses—conical structures of sticks, mud and stones, which extended from the bottom to several feet above the surface. The dam has long since been broken through, and the beavers which built it probably furnished the fur for our grandmothers' cloaks.

Beaver Bill was one of the bachelor trappers, so called to distinguish them from those who were married to In-

dian women. The latter generally lived and traveled with the tribe into which they had married. They were never so successful as the bachelors, for game of all kinds, and especially the timid beaver, fled from the vicinity of a great camp. As a class, Bill had a great contempt for them. "They are too lazy to live," he used to say. "The man catches a few beaver, his wife skins them, fleshes and stretches the hides. He shoots some buffalo, she takes care of the meat and tans the robes. She cuts the wood, carries the water, cooks, breaks and makes camp, sews moccasins and buckskin shirts for him while he just lies around and smokes. And then when they go to the fort to trade, what does she get for her work? Nothing but a thin calico dress and a red checkered shawl, while he just naturally blows himself, filling up on red liquor and bucking fero."

In the spring of 1868, soon after the ice went out of the streams, Beaver Bill left Fort Benton to trap on the upper Milk River, about one hundred and fifty miles northwest of the fort. As usual, he went alone, riding a good saddle horse and leading three others, which were lightly packed with his small A tent, bedding, traps, and provisions. Beaver had chosen the Milk River for the spring trapping because at that time there were no Indians anywhere in that vicinity. The Bloods and Blackfeet were camped far north of there, on the Red Deer River, and the Piegiens were somewhere in the vicinity of the Cypress Hills. Having arrived at the trapping ground, Bill located his camp in some pine timber at the foot of the mountains, and kept his horses hobbled in an open grassy park still further back, where any passing war party would not be liable to see them. Beaver were plentiful. At that point several small tributaries of the river converged, and each one of them was dammed every few hundred yards, every pond thus formed being inhabited by a number of beaver families. Bill had a dozen traps, and every morning found six or eight beaver in them, all he cared to skin, flesh and stretch in a day. "I was having a pretty good time," he said, in telling the story of the expedition. "No end of beaver, fine weather, and a good camp was enough to satisfy any trapper. The days were warm and I used to sit out at the edge of the timber fleshing my morning's catch, where I could see far down the valley, and to the north and south of it. I always went a heap on that old saying: 'Forewarned is forearmed.' If there were any war parties prowling around I wanted to see them before they did me. I had my scouts out, too; the valley and the hills were covered with game, and I knew that they would start running in every direction at the approach of a party. I was careful not to alarm the game, doing all my trapping above camp on the streams in the timber. What I did scare there ran only a little ways, just out of sight, and went to feeding again. There were buffalo, elk, deer and antelope, innumerable bands of them, and they often came within a few yards of camp, sometimes closer than I wanted them to; that is, the buffalo, for the temper of an old bull is always uncertain. He will often charge a man without the least provocation. I never built a fire during the daytime; after dark I would start one back in the thick timber and cook enough food to last until the next evening. The first night I made camp there a skunk came up close to the fire and nosed around among my things, attracted to the place, no doubt, by the smell of fresh meat. He and I got to be pretty good chums, and just as soon as night came he would appear for his supper, scraps of meat I used to toss him. Finally he became so tame that he would take food from my hand. I used to talk to him a good deal, and he would sit listening, his head cocked to one side, his eyes shining brightly, just as if he understood. 'Partner,' I used to say, 'here's a nice piece of fried meat; come and get it, but mind that you behave as a gentleman should. You know what I mean, and a word to the wise is sufficient.'

"So the days passed. In a couple of weeks I had ninety-five beaver skins. I was doing as well as any reasonable trapper could wish. Game was very poor, as it always is in the spring. I had used up the last of a deer I had killed, and concluded to go up on the mountain and get a bighorn. A young ram, or a ewe, I knew, would be pretty fat and good eating. So one day, after taking care of my morning's catch, I started out, and in an hour or more came to timber line. Beyond were the bare rocks, shale at first, sloping steeply up to the broken cliffs which formed the summit of the mountain. Here and there on the shale slope were patches of grass-grown turf, fine feeding places for bighorn, but not one of the animals was in sight. There were some on the mountain, however, for I found their trails running in every direction. I went on up the shale, and after a hard climb over the loose stuff came to the foot of the cliffs. They consisted of a series of shelves or reefs, one above the other, in places perpendicular, and here and there broken away. I was climbing up one of these broken places, stepping from one rock to another, when I landed on one that rolled. I lost my balance and went rolling down, too, for some distance. It was a wonder that I didn't break a leg or an arm in the fall, but I escaped with only some scratches and a bruise or two. When I lost my balance my rifle flew out of my hand and went clattering down among the rocks. Picking it up and looking it over to see if it had been injured, I could find nothing wrong with it, and resumed my course. I had not gone more than three hundred yards when a band of ewes appeared on the next shelf beyond, and stopped to see what it was approaching them. They had probably never before seen a man. There was a yearling ram in the bunch, and at him I took a careful aim and pulled the trigger; the hammer clicked, but there was no report. I recocked the rifle and tried again, with the same result. 'A bad cartridge,' I said to myself, and extracting it slipped another one into the chamber. The arm was a .50 caliber needle gun, considered a fine weapon in those days. The sheep were still standing, looking at me curiously. 'Now, then, my young fellow,' said I, as I raised the rifle to my shoulder, 'you are surely my meat.' But he wasn't; the hammer again clicked, that was all, and the sheep, starting off on a trot, disappeared behind a point of rocks. Then I sat down, threw up the breech block of the gun, and saw at a glance that the point of the firing pin was broken off. There had been a flaw in it, so that the two parts were held only by a thin bit of steel, and that had been snapped by the jar the weapon got on the rocks.

Well, perhaps you can imagine how I felt. There I was, at the mercy of almost anything that wanted me; an old grizzly bear, a buffalo bull—why, even a bobcat might make a break at me, and I was his meat. But there was worse to come. From where I sat there was a splendid view of the country down at the foot of the mountain and far out on the plains. The park where my horses were, although two miles distant, seemed, in the clear thin air, to lie almost at my feet. I could even distinguish the color of the different animals. They were grazing peacefully enough, and then suddenly they all turned at once and jumped as fast as their hobbles would allow toward the upper end of the park. Out from the timber came a dozen or more dark figures, took after, surrounded, and caught them. In spite of all my precautions, a war party had discovered my camp.

"If I felt badly before, I was dazed now. The breaking of the gun was a great misfortune, but I had decided to go in to Fort Benton with what furs I had and get it repaired or buy a new one. And now I was not only afoot, but without food, for of course the Indians would take all my provisions. But, I reasoned, they will not take my traps. If I had just one of them I could catch enough beaver for food, and gradually make my way to Fort Benton.

The Indians led my horses out of the park, and after a little while smoke began to curl up through the trees where my camp was located. No doubt they were having a high old feast with the provisions they found there—sugar, coffee, bacon, a batch of sour dough bread I had baked that morning, and a pot of baked beans. I sat there on the cliff for hours, trying to think of some way out of the predicament I was in, turning over a dozen plans in my mind, but rejecting them all.

"There was but one way out of it: I must get hold of my traps or starve. About four o'clock the Indians filed out of the timber leading my horses, and, climbing the north slope of the valley, disappeared in another point of timber. I remained where I was until dark, but did not see them go out of it. I saw through their scheme at once. Some of the party had remained at the camp to pot me when I returned, the others had climbed over the ridge to lead me to believe that they were satisfied with the plunder of my outfit and had resumed their journey. Well, they were not going to get my hair by any such ruse as that. I remained where I was until night came and the moon arose, and then went down the cliff, down over the shale slope and into the timber. The traps were set in two beaver ponds about three hundred yards above the camp. I made my way to the creek they were on, and followed it down, passing numerous ponds which I had not yet trapped. In every one of them the beaver were swimming and splashing about, and it made me mad to think that a lot of cursed Indians had knocked me out of trapping the best bit of fur country I had ever seen. At last I came to the upper one of the two ponds I was heading for, and approached the foot of a slide where I had set a trap. There was something lying across it at the water's edge; I picked it up and saw it was the stake to which the chain had been attached: the Indians had found and taken the trap. I concluded at once that they had taken them all; every trap had been set in the water at the foot of a slide, and the stake of each one was in plain sight, sloping out from the bank. I went on to the next slide, more slowly and cautiously than before, for I thought that some of the enemy might be lurking in the brush thereabouts, as well as at the camp, waiting to get a shot at me. The trap which had been set at that place was also gone, and so was every one of the five at that pond. I hesitated some time about going on to the next one, which was nearer the camp, but finally made up my mind to do it; I was getting pretty hungry and wanted a trap. The shores and banks of this pond were more open, grassy parks studded with clumps of willow brush running back some distance to the pine timber. I got down on my hands and knees and crept along, keeping as near to the water's edge as possible, occasionally rising up and looking back into the brush and parks for any sign of the enemy. There was a full moon, and the night was nearly as light as day. It was the third or fourth time I had cautiously stood up and peered over the bank, that, just as I was about to stoop and crawl on, I caught the glint of metal in the shadow of some willow brush. Long and hard I looked at the place, and finally made out what I took to be two Indians sitting there muffled in their robes. Still, I could not be sure. Perhaps I stood five minutes staring at the dim figures, and then again I saw the gleam of metal, as if one of them had moved his gun. That was enough; inch by inch I sank down below the level of the bank and began to crawl back whence I had come. More carefully, more silently than ever, you may be sure. And there was a choking lump in my throat, a creepy sensation in my back, which was a fair target for the enemy if they came and looked over the bank. Yes, I was thoroughly scared, and at the same time I was mad, just choking with anger. If my rifle had been in good condition I could have surely plunked one of those silent watchers, perhaps both of them, and escaped up the mountain before any of their brethren could have arrived from the camp. Well, I crawled on and on, stopping every now and then to listen, and finally got back to the other pond, arose, and sneaked through the forest up the mountain side.

"At daylight I was back in my old place on the cliffs. Down at my camp smoke was again rising above the tree tops, and four Indians were riding my horses down the slope toward it. I had sized up their scheme exactly: They had tied the animals in the point of timber for the night, and then the most of them had sneaked back to the camp to lay for me. Well, I still had a whole skin, but it was woefully empty. I had never been so hungry before.

"Soon after sunrise I saw the war party file out of the timber and strike off toward the north on a trail used by the various tribes of the Blackfeet when traveling along the foot of the mountains. They were not riding my horses this time, but leading them, and from the size of the packs on them I doubted not that they were laden with my whole camp outfit and beaver skins. I watched the outfit for several hours, until they disappeared over the top of the big ridge which slopes down to the St. Mary's River, and then started for my camp. I was sure that the war party had all left, having concluded that I

had seen them and lost no time in getting out of that section of the country. On my way I visited the pond where I had set seven traps, and where I had seen the Indians the night before, but, as I expected, not a trap was left. "Well," I said to myself, "there is nothing to do but to kill and eat my old partner the skunk, and then devise some means of killing enough meat on the way to enable me to get to the fort." I went on to the camp very slowly and watchfully, you may be sure, in case one or two of the war party had remained behind, holding my old gun in readiness just for a bluff, if nothing more. It would have served for a club.

"The first thing I noticed when I came to the camp ground was the skin of my old partner lying near the still smouldering fire, and by that token I knew that the war party were either Crees or Assinaboines, for none of the other tribes in the Northwest eat skunks. Yes, they had killed and devoured my partner, although they undoubtedly had plenty of buffalo or deer meat. Well, there is no accounting for tastes. I never had tried skunk meat, but I was anxious to. As I had thought would be the case, nothing remained of my outfit. Tent, bedding, provisions, furs, everything had been taken, except my cast iron Dutch oven, and that had been smashed. I sat down on a log feeling pretty blue, but by no means inclined to give up. I had matches in my pocket, a good sheath knife at my belt; all around was game of various kinds, and I was bound to get some of it some way. I remembered all at once of hearing Hugh Monroe, an old Hudson Bay Company trapper, tell about an Indian tribe of the far north using dead falls to catch beaver; a heavy log was suspended over a slide, a stick, which was the trigger of the affair, was placed across the path about four inches above the ground; when the beaver came along and pushed the stick, down fell the log and broke its back. I determined to try the plan, making a model first that would work, and then setting a dozen or more of the contrivances along the ponds. But first I went to the river where I had thrown in the beaver I had skinned, half hoping to find one of the carcasses, and cook a part of it. The stream was high and discolored, and very swift. The bottom could not be seen even in shallow parts, but hoping that one of the carcasses might have been thrown up on a bar, I went down along the shore for some distance. Not one could I find. Returning, I cut some good sized willows, went to my lookout place at the edge of the timber and began to work on the deadfall model. I had barely started in, however, when I saw some horsemen on the rim of the valley to the south coming down the trail, and then behind them came a long string of horses, some packed and some loose, and several hundred mounted people. I saw at once that the horses dragged no lodge poles nor travois, so it was evident that their owners were mountain, or west slope, Indians. If they proved to be the Flatheads, my troubles were over, for they had been friendly to the whites since 1846, when that valiant Jesuit, Father De Smet, had visited them and started a mission in the heart of their country. They had even embraced the Catholic faith. When I first saw the outfit I lost no time in retreating to the shelter of the pines, where I could watch them and still not be seen. On they came, down the valley slope, across the river, and rounded up on the flat about two hundred yards from my hiding place. Some of the packed horses were hard to catch, running around in great circles. One of them, a swift wild thing, came within twenty yards of the timber, pursued by half a dozen young Indians shouting and encouraging their horses as they swung their lariats. I recognized the language, although I could not understand it. They were the Flatheads, as I had hoped, and without hesitation I walked out of the timber toward them when they were preparing to camp. They all stood and stared at me in amazement, for it was an unusual thing to see a lone white man, afoot at that, anywhere on the plains in those days. As I neared them the chief and several leading warriors advanced to meet me, hands outstretched and smiling pleasantly. Now bless the red man, say I, who invented the sign language, that expressive means of communicating thought by the hands, which all the tribes from Great Slave Lake to Mexico know. I could not speak any Indian language, but I wasn't bad at signs, and in a very few minutes the Flatheads were aware of my misfortunes. Twice the chief asked how many were in the war party, and I replied that there were eighteen. He also inquired how I knew that they were Crees or Assinaboines, and I told how they had killed and eaten my partner, the skunk, which I had calculated to roast for myself. That made them laugh.

"Well," said the chief, after giving some orders to his women, "you are hungry, and we are going to fill you clear to the neck with the best food we have. Then some of my young men are going to accompany you, and help you get back your outfit, your horses, and of course some scalps of the enemy. They have done us wrong, both the Assinaboines and Crees, and we must have revenge."

"It didn't take the women long to cut some poles, put up their lodges, and in a little while a real feast was set before me. There was boiled boss ribs of buffalo, berry pemmican, boiled arrow root, and sweet dried camas, a fine spread for a hungry man, and I surely did justice to it.

"Upon deciding to pursue the war party, the chief had sent two scouts on their trail to locate them. It was perhaps an hour later that about fifty of us started out, all well mounted and well armed. The chief, who did not go, loaned me his war horse, a powerful, swift animal, and also his gun, a muzzleloader. I was never with a lighter hearted crowd than were those Flathead warriors. They talked and laughed, sung war songs, and cut up all sorts of capers as we rode along. And we did not spare the horses, keeping them on a steady lope except when the hills were steep.

"The sun was about an hour high when we rode down the pine and quaking aspen slope to the St. Mary's River, and right at the ford found our two scouts awaiting us. Of course I didn't understand what they reported; we crossed the stream at once, however, and went on faster than before. A mile further on we crossed another stream, a tributary of the St. Mary's, and, emerging from the belt of timber which fringed it, saw the war party not a quarter of a mile ahead crossing a long, wide prairie. They saw us as soon as we did them, and crowded around

my four horses, stripping off the packs, pushing and pulling each other in frantic endeavors to mount and run for the timber. Of course there was not room for them all on the animals, and the result was that only two got away on my saddle horse before we were upon them. I passed right ahead after the two, as did the chief's son, and we overtook them about a hundred yards from the timber. The fellow mounted behind turned and fired at me, but missed his mark. I let loose at him about the same time, and he dropped limply from the horse to the ground, prone on his back, and never even kicked. His companion followed him a moment later, shot by the young Flathead. He was only wounded, but lost his gun in the fall, and leaving the youth to finish him I went on and caught my horse. That was all I saw of the battle, if such it may be called, for the last one of the war party was killed before I caught my horse and turned back. They hadn't put up much of a fight, nor could they, armed as they were with the Hudson's Bay Company's smooth-bore flintlocks. The Flatheads kept circling around them and shooting, and laid the last one of them low in less than three minutes. None of our party was killed, and only two received wounds, which were painful, of course, but not dangerous. And so, excepting some provisions, I got back my whole outfit, and the Flatheads got what they wanted, glory and scalps—Cree scalps.

"When we returned to camp the next day, you may be sure there was a great jollification, feasting and scalp dancing, which lasted far into the night. In further conversation with the chief, I learned that he and his people intended to hunt and trap along the foot of the mountains as far south as Sun River, and then go to Fort Benton to dispose of their furs. The old fellow insisted that I should accompany them, offering the loan of a rifle and a place in his lodge. I accepted the offer at once, and never regretted it, for I had a pleasant time and managed to catch a fair number of beaver. When we arrived at the fort, about six weeks later, I gave the old chief a Henry rifle and the members of his family a blanket each, which made their hearts glad. And so ended my experience in the wilds for that season. I have often wondered how I would have got along had I not met the Flatheads. Some day I shall try that deadfall contrivance and learn if a beaver can really be caught that way."

Where Beaver Bill and the Flatheads fought the Crees, Government engineers are building an immense dam to store water for an irrigating canal. The wild Indians, the buffalo and other game have disappeared, and busy ranchers till the soil where the old time trappers made their camps. It is well that they are in their graves, those adventurous old plainsmen, for there is no longer any place for them to roam. Could they return and see the wonderful change which has taken place since yesterday, as it were, their astonishment and sorrow would be unbounded. They had no use for civilization.

J. W. SCHULTZ.

The Buckskin Lodge.

AWAY in the wilds of Canada there is a deer hunters' lodge built of great round unhewn pine logs that has housed hundreds of campers, canoeists and anglers. This lodge was built by the members of the Buckskin Lodge, of Pittsburg, furnished with cots, mattresses, chairs, tables, dishes and an immense stove. The lodge is built on Hope Island, a small island sparsely timbered with pine and hemlock trees, as essential to the camper as powder and ball to the hunter. Nailed to the gable are these words that have cheered hundreds of weary tourists: "Welcome to Buckskin Lodge." Inside you find further directions: "When you use the mattresses hang them up so the wood mice won't cut them." All over the walls

BUCKSKIN LODGE.

are inscriptions like the following: "The Rosselle Fishing Club of Homestead, Pa., thanks the Buckskin Lodge for its hospitality." "The Washington Club of Allegheny does the same."

I have inclosed a photo of the Buckskin Lodge that will be recognized by all who have made a voyage down this delightful river.

On August 1, 1902, Guy A. Hodgson, Mart Kinser, Geo. M. Meanor, Prof. Jno. H. Chatham, William Collins, Prof. Robt. M. Martin and the writer left Bennett's cottage on Severn River for this lodge. Capt. Woods ran us down on his little steamer across Sparrow Lake to the Ragged Rapids, some ten miles down the river. Here we spent a few hours angling, with good results. Orillia, a city of 15,000 people, has built a large power plant to furnish light to the city some seventeen miles away.

Meanor, Chatham and I crossed the dam and went

to fish just below the falls in a circling bay filled with driftwood. With little trouble we soon made a raft by throwing some boards over the logs and had a comfortable stand to fish from. The sport was fine. Prof. Chatham had caught several fine bass in the foam and I had done well. Meanor, wearied waiting for a large one, tried in the bay below, and I soon saw he had a strong attachment for some sort of marine creature that was giving him no end of trouble as it darted in and out among the driftwood. To have it said you assisted in the landing of a very large fish is much honor, and that I might share in George Meanor's delight I hastened down with a fine gaff, which this same mechanical George had made for me, and by a lucky stroke dished up a magnificent 9-pound pickerel, the finest and largest I had ever seen. It was dark above with glittering golden sides. From this golden appearance the French-Canadians call them dore. Meanor tried to land a running mate for his prize catch, but in vain. He wrapped him in damp moss and leaves and stored him away in a cool cave in the rocks and dropped down the river with the avowed purpose of taunting Chatham and me with another princely pickerel.

As I angled around and on a mass of drift I spied a very large fish, but was unable to determine its kind in the shadow-darkened waters. There he lay gently fanning the water and reminded me of a sleepy cow chewing her cud. By a lucky stroke I caught a 10-inch bass, which I persuaded to carry my hook to where I had seen his excellency ruminating. From the lively dashes of the bass I knew there was some sort of trouble at the nether end of my string. I had concluded that the fish was a muscullonge and might run from 10 pounds up, so was persuaded to take no risks among the snags and I handed Prof. Chatham my rod with instructions to draw him gently toward the open and I lay prone upon the log under which the fish must go toward the open water. Gently the Professor drew and patiently the fish followed on, and with thumping heart I waited. Would he never come? Presently I saw him slowly following the pull of the line—could see the tail of the bass grow less and less as it disappeared, and learned to a nicety what it is for big fish to swallow the little ones. He soon made a dash for the open water, and as he went by I gaffed him. It proved to be a pickerel, almost an exact mate for the one Meanor caught. The fish was not hooked at all, for as I lifted him the bass was disgorged and floated down the river, having become unhooked by the struggles of the pickerel. I wrapped my prize in moss and ferns, carried it to the cavern and laid it by Meanor's prize.

Now I had broken even with Meanor, a thing I had not dared to hope for. Perhaps some strange turn of the fickle fortunes of fishermen might enable me to beat him. I caught another quarter-pound bass—a lively one—and with him I took long chances. Letting out almost a hundred feet of line I sent my bait under all the drift in the bay, and had wearied in well doing, when there came another glad surprise. I again gave the line to Chatham, who gently led the captive to his doom. I gaffed this fish as it swam past. This pickerel also was not hooked. The prizes were so great and the chances of getting them by the ordinary method so slim, that I adopted this plan with success. As Meanor sauntered by he remarked: "Norris, anybody steal my big fish? Gee Whitakers! When did these other whales crawl into this nest?"

Norman E. Bennett, proprietor of a resort on the Severn River, pronounced them the largest fish ever taken from the river. Bennett said he had speared many good ones in the spring, but none so large as these. Be that as it may, we were satisfied with our catch, and will rejoice with him who catches a larger one. The three weighed about twenty-five pounds.

We then portaged our stuff over the long Ragged Rapids portage and had dinner with the superintendent of the power plant. At 2 P. M. we were under way.

The day was clear, cool and delightful; the scenery was inspiring; the air was crisp and bracing, and when I got a chance to sit in the stern and see the other fellows row the boat I enjoyed life to the limit. We were a little apprehensive about shooting the rapids, and since there was considerable of this kind of game to bag in this locality the tyros who had never shot the chutes were a trifle timid. Shooting down those long avenues of raging rushing waters is indeed a unique sensation—once experienced it is never forgotten. You come down over the first break of the waters full of dire apprehensions, scenting danger in each flying eddy-turmoil and trouble all around you. The angry rocks ahead soon fly to the rear, the waves foam and fret in anger, the flying drops of water strike your face, bringing positive alarm. The white ghost-like cross that marks the spot where a voyageur was drowned flies by; soon all is over and you rest in the quiet waters at the foot of the rapids, joyously exhilarated and aglow with a pleasurable aftermath of excitement.

We pass the long straight reach of waters and swing around the river's bend in sight of the Cherry Creek lumber camp at 3 P. M. The old camp is now in ruins, roof tumbled in, and a gloomy atmosphere surrounds the place, but I never pass without halting to inspect it, for it is here I spent a delightful week nearly ten years ago. The watchman then at the camp was a one-legged man named Andrew Feeney who very cordially welcomed us to his lodge, for we were the first people he had seen for seventeen days. There were few people traveling this river ten years ago in early July.

As our boats grated at the landing at Hope Island, where the Buckskin Lodge is located, the sun was dropping behind the big pines on the western hills.

After a hurried lunch we rowed a mile down the river to Cape Rock Bay to have an evening's fish. As we pulled into the mouth of the bay, I heard some rapid firing of rifles somewhere in toward the Lost Channel. The next day a party came up the river bringing three bear. It seems that as they were passing a bay leading into the Lost Channel, Willie Doolittle, their guide, saw a little bear doing a two-step on the cliffs above. Knowing that the mother was near, they crept around the rocks and came upon her and the cub. The mother they shot and one of the cubs, intending to take the other alive. After chasing little Johnnie nearly a mile, they caught him, only to find that a bullet meant for the fond mother

had broken his front leg, and they decided to kill him. Thus did these we call kind gentlemen cruelly break up as happy a family as was in Muskoka District.

At the head of this bay we began fishing. I was baiting with large dew worms and was having fine success with pickerel and pike, having landed a half dozen. I fished from a large rock that had come down from the cliffs above; and I here tried for bass. I think I never had such luck as I had that evening. When a bass was hooked there would come up from the depths of the dark waters a dozen or more others, gobbling up the pieces of bait my captive would disgorge. There were pickerel and bass, pike and channel cats in the motley crew. In one lot that came up after a fish caught by another of the party, was an unusually big bass. I cast a worm to him which he promptly took. I struck, hooked him, and after a hard fight the bass won.

We hurried home at twilight, and cut pine boughs for a bed. We filled the bunks full of the pine tassels and found that they served the purpose well. The next morning we had a fine breakfast of fried bass, boiled eggs and potatoes, bread and butter. We were joined about noon by August and Theodore Yahn and Fred Hays, of Homestead, Pa. That day we spent in fishing and lounging around the camp. In the evening we started back in the woods to watch for deer, but none came out, although many had been feeding in the swamp. That night we all turned in early and slept soundly, for next day we had nearly twenty miles to go to reach Sparrow Lake.

At daylight we were all astir, had breakfast over, and were ready to start at 6 A. M. While we were eating there was a strong wind blowing up the river, and our prayer was that it might continue. We rowed the heavy boats around the first bend and went ashore and cut three masts. By tying the corners of our bed quilts we had pretty fair sails, and we sailed the entire distance home. I am sure we must have presented an odd sight as we scurried up the river with bed quilts made up of many quaint patches for sails. One of the boys said they would arrest us for pirates as we came over Sparrows Lake.

At sundown we slipped under the overhanging trees in the Severn River above Sparrow Lake, and in ten minutes our boats touched the landing. Thus ended another of the many delightful tours I have made down this charming river.

JAMES M. NORRIS.

Natural History.

Grant on the Caribou.

THE recent discoveries of new forms of caribou in Alaska and northeastern America lend an especial interest to a paper recently printed by Mr. Madison Grant, the secretary of the New York Zoological Society, and printed in the Seventh Annual Report of the Society. Mr. Grant, in fact, has been in such close touch with certain zoological investigations in northwestern America, and has contributed so greatly toward the carrying out of these investigations that his name must always be closely linked with this aspect of Arctic exploration, and it is gratifying that his name should have been given to one of the new forms of caribou recently described from Alaska.

The paper in question is of great interest, not only for what it tells us in words about the caribou, but also for the great number of very beautiful illustrations which it contains, all of them tending to illuminate the questions under discussion, and by means of actual specimens to make clear the author's precise meaning. Besides this, there is a two-page colored map, showing the range in America of the two groups of the caribou.

Mr. Grant divides existing caribou into two groups, to be known as Barren Ground and Woodland caribou. To the Barren Ground group belong the European reindeer, the species described from Spitzbergen, and any undescribed races existing in Siberia; while, on the American side are the Greenland caribou, Peary's caribou from Ellesmereland, the Arctic form from the extreme north of America and the Arctic Islands, Grant's caribou from the Alaskan Peninsula, and Stone's from Cook Inlet. There may be also undescribed American races.

The Woodland caribou are all American. Taking them from east to west they are the species from Newfoundland, that from Canada and Maine, west to Manitoba, the Rocky Mountain form from Idaho to Central British Columbia, known as *R. montanus*, and *R. osborni*, from the Cassiar Mountains of British Columbia, northward, and any other Woodland forms that may exist as yet undescribed.

Mr. Grant's basis of classification depends chiefly on size, color and antler development. It is readily acknowledged that anyone of these three characters is variable and uncertain. Nevertheless, as has often been said, if one has enough specimens there is an average of all these characters for any region which the practiced eye can readily recognize. Similarly as to the antlers, "within the extreme limits of this irregularity there are certain types of architecture which, though clearly defined, are difficult to describe."

One of the most striking characteristics of the genus *Rangifer* are found in its feet and in its antlers, to which may be added the presence of horns in the female. The enormous development of the brow antler in the caribou, which by some has been considered characteristic of the Woodland caribou, is, of course, not peculiar of that group, as specimens in Washington and elsewhere abundantly prove.

Among fossil remains from the oldest Pleistocene deposits of northern and western Europe, those of caribou are abundant, and it is interesting to note that these remains represent both the Barren Ground and the Woodland forms, although, so far as known, no reindeer of Woodland type are found in the old world to-day.

Mr. Grant is inclined to believe that the Arctic Barren Ground caribou found its way into western Europe over a land bridge which at the beginning of the glacial period connected Greenland, Spitzbergen and Norway. "At that period," he says, "those portions of Russia lying between the Black Sea and White Sea and the major part of Sweden were entirely submerged, as well as a large part

of northern and eastern Germany. This condition prevented the spread of this group into eastern Europe at that time. Its extreme eastern limit was near Berlin, where, in one of the oldest Pleistocene deposits, fossil remains of the Barren Ground caribou have been found. At a much later period, probably during the interglacial phase of the glacial period, a land connection was established across Russia, and an invasion of Siberian mammals took place, bringing with it the Woodland caribou.

of Hudson's Bay. Mr. A. P. Lowe described three herds of Barren Ground caribou in Labrador. There is a wide belt of land along the McKenzie River where no caribou are found, and beyond which *Rangifer arcticus* does not extend. In northern Alaska there are reported to be still two or three species of caribou which have not yet reached the hands of naturalists. For these we must wait, and it is quite possible that we may wait in vain, since the whalers, which each year in numbers visit the Arctic Sea,

NEWFOUNDLAND CARIBOU (*RANGIFER TERRAENOVAE*, BANGS).

Wild stag, photographed, 1902, on a Newfoundland barren, by Charles D. Cleveland, and reproduced by permission.

This animal pushed as far west as England, the north and east of France, but never reached either Scandinavia or Ireland, the latter having become detached from England at that time." Woodland caribou, according to Mr. Grant, probably originated in northeastern Asia, and reached America over the land connection which formerly existed across the Behring Straits.

According to this view it will be seen that these two types of reindeer had become differentiated before the

hire the natives to supply them with fresh meat and destroy vast quantities of reindeer, and may very possibly exterminate certain species of limited range.

On the Alaskan Peninsula occurs the new and interesting caribou known as *R. granti*, which was formerly abundant on Unga Island. It is believed that this species is in immediate danger of extinction. *R. stonei* of the Kenai Peninsula, in Alaska, is a large species approaching in size some forms of the Woodland caribou, but

glacial period. Whence the reindeer type arose we do not know.

Of the old world reindeer the best known is *R. tarandus*, domesticated in Lapland and in Siberia, the domesticated animals being less in size than the wild ones of the same region. The Spitzbergen form is small, and has certain well defined skull characters. There may be other old world forms. Greenland and Ellesmereland has each a caribou of its own, and one of the northernmost animals of the group is that reported from Fort Conger, Grinnell Land, in latitude 82 degrees. The typical Barren Ground caribou ranges on the American mainland to the west

preserving the characteristics of its group.

Of the Woodland group the range of the common form has been indicated. It is said to extend in the west as far north as Great Slave Lake, and at various points west of Hudson's Bay its range and that of the Barren Ground caribou overlap. The forms *R. montanus* and *R. osborni* come from the mountains of the Pacific Coast. They are dark and of large size.

Of the Newfoundland caribou, two types are recognized by the natives. These may be nothing more than individual variation. The building of the railroad through Newfoundland has made these hunting grounds so acces-

sible that this species has been threatened with extinction, and, but for the new game laws recently passed, the animals must soon have been exterminated. Even now the prospects for their preservation are not bright, since in winter they are slaughtered in great quantities by the natives, to whom they furnish the only fresh meat accessible, and who are as reckless in their destruction as all other untrained human beings commonly prove themselves.

Mr. Grant's excellent paper should be in the hands of every naturalist and big-game hunter. It is full of information and is a general rounding up of one of the most interesting groups of the deer. Whether agreeing or not with Mr. Grant's conclusions, no one can read the paper and see the illustrations without acquiring knowledge.

Instinct and Reason.

Editor Forest and Stream:

In FOREST AND STREAM of June 6, 1903, Hermit says: "I do not believe that the speech of the lower animals is inherited. It would be just as unreasonable as to claim that human speech is inherited." In another part of his communication he says: "The intelligence of the wild things is a fixed fact, and the sentiment is growing rapidly with the intelligent public. . . . Instinct is no longer king of the wild things. He is deposed and must take his place with the commoners." I do not doubt that the "wild things" are endowed with a degree of intelligence, but I believe that a full and legitimate recognition of this fact will not "depose" instinct; and I would like to know what trustworthy evidence there is that any of the animals, other than man, possess a language, or speech, that can be taught, or that needs to be taught, in any proper sense of the world; or as a child is taught the language of its parents, for instance. I have never given any systematic study to the habits and capacities of animals, and make no pre-

consciousness, of desire without consciousness of either cause or consequences. Action which is based on intelligence or reason, is premeditated. Action which is based on instinct, is impulsive and without premeditation or consideration. It seems obvious to me that all creatures with the perceptive faculties of taste, touch, hearing, sight and smell, are endowed, more or less, with both intelligence and instinct. It is only in the lowest forms of animal life that we find no traces of intelligence. And it is only in man that we find instinct in subordination to intelligence. And it is to be noticed, in this connection, that man is the one creature intrusted with "dominion," and of whom the Creator requires a responsible service. The sea-urchin fulfills all the functions of its life by instinct alone. A bird, by instinct and intelligence in combination, with instinct as the controlling factor. In the case of man, so far from instinct being a safe guide, a dependence on it will result in destruction; and his welfare consists in carefully keeping it in subjection to intelligence. It would seem that nature intended instinct as a substitute for reason where reason is not available. In the case of the lower animals the endowment of reason is inadequate and instinct is a safe primary dependence. In the case of man the endowment of reason is adequate, and instinct is utterly unsafe as a primary dependence.

II.—Instruction Must be Based on Intelligence.

Instruction consists in creating a consciousness of the relation between cause and effect, or of the relation between thing and thing, in the mind of the pupil; or the creature that is being taught. Hence it is obvious that instruction must be based on intelligence, and not on instinct. In teaching language, the word or sound, representing a thing, is associated with the thing for which it stands, in the mind of the instructor; and instruction consists in creating that same image, or the same association of thing and sound, in the mind of the pupil. These considerations are necessary to a com-

to force fiction into the lap of truth, for the purpose of giving the beasts and birds an intelligently constructed language, without having first made sure that they have need for such a language.

If a hawk flies over a farmyard, the outcry of the old fowls will cause chickens and turkeys, not a day old, to squat, and to try to hide. They evidently understand the language, but under the circumstances it seems absurd to suppose that they understand it by instruction. It is obviously impossible for the parent to create the necessary association of thing and sound, in the consciousness of the young bird, until after it has perceived, or known of, the thing which the sound represents. But here the young bird associates the thing (danger) with the sound before it has had any perception or knowledge of the thing. Hence it is evident that the young bird is conscious of the connection between sound and thing by instinct, and not by instruction.

A farmer turns his herd of cows out to pasture, of a morning, and perhaps shortly afterward one of them will have a calf, without his knowing of it. After a time the calf, having filled itself with milk, will lie down, and the cow will go to eating grass with the rest of the herd. When the calf gets hungry it will get up and bawl. Its mother will answer it with a half suppressed low, and go to it in a leisurely, unconcerned way, to which the other cattle pay no attention whatever. Some time afterward, during the day, a man will be crossing the field and tumble over a young calf lying concealed in a bunch of weeds. The frightened little creature will scramble to its feet and let out a bawl that will set every cow and bull in the field on the war path in an instant. The newly born calf is endowed with a language which is well understood by its species. The circumstances of the case make it impossible to entertain for a moment the idea that it has received a knowledge of that language by instruction.

IV.—Do the Beasts and Birds Need to Teach Their Young to Eat?

The question is not, whether they do assist their young to eat in some cases, but whether they need to teach them in all cases, as Hermit, if I understand his statement, says that they do. Of course no one contends that instinct can perform impossibilities, and the young bird that cannot move from the nest must have food brought to it, and the kitten that can neither see nor walk must be cared for by the parent. But in neither of these cases is there any instruction in the art of eating. What is it that causes the young bird to stretch up its neck and open its mouth to receive the food, but instinct alone? If instinct did not cause the newly hatched birds to do this I opine the old ones would be in a sad quandary. As a rule, the young of beasts receive no help from their mothers in getting their first drink of milk. They only need to have the milk, or, rather, the udder, where they can get at it, and instinct will do the rest. In fact, they are not infrequently repulsed by their dams. A cow with a painful udder will sometimes fondle her calf in the most motherly way, but refuse to let it get a drop of milk. In respect to getting the milk, all that a healthy calf asks of its mother is to stand still. Occasionally a young ewe will refuse to recognize her new born lamb, and the little fellow will be found persistently trying to get to the milk, and she as persistently butting him away. Hold her still and the lamb will soon be sucking without the least instruction. Young pigs, that have just come into daylight, will follow each other around to their mother's teats as knowingly as if they were used to it. It may be said that the grunt of the sow attracts them, but they stop at the teats without going so far as the grunt. And, moreover, at this stage of their existence, how do they know that their mother's grunt means more than any other noise except by instinct, pure and simple? It is quite possible that newly hatched chickens would not find enough food to keep them alive if left in a farmyard entirely to themselves. Perhaps they would not find any suitable food at all. But place suitable food where they can easily get at it and they will soon fill their little craws without the least instruction. That the hen finds food for them by searching and scratching is undoubtedly true; but she does not have to instruct them how to eat it; nor do the chicks restrict themselves to what she finds and gives them. Incubators now turn out thousands of chickens that grow to maturity without ever hearing the motherly cluck of a hen. Young chickens eat and scratch, and young ducks take to the water as naturally as smoke flies upward.

V.—Do Young Birds Need to be Taught to Fly, to Sing, and to Build Their Nests?

Would instinct alone impel young birds to fly? is the question. There is no doubt that the parent birds urge the young ones to fly; but the action of the old birds seems to be not instruction, but encouragement. The instinctive desire of the young birds to fly is, as yet, overbalanced by the instinctive fear of getting hurt, and the old birds give a preponderance to the desire to fly by mitigating the fear of getting hurt. This is not instruction in any legitimate sense of the term. Both old birds and young fly by instinct alone. They simply fly, and that is all there is of it, so far as their intellects are concerned. When I was a child some one gave me a squab pigeon, which was nearly ready to fly. I kept it in a coop, frequently taking it out and letting it walk around where I happened to be. After some time it commenced to take short flights, gradually increasing the distance. It came back at frequent intervals for several days, and then flew away, and I saw no more of it. No other pigeon was with it after I had it up to the time it commenced to fly. It had no instruction and did not need any.

In regard to singing, birds are imitative creatures up to the limit of their intelligence, and it is not improbable that the example of their elders may hasten the performance of the young ones. But I am convinced that the idea that the young ones would not sing without the example of the others, is based on theory rather than knowledge. If the birds learn to sing altogether

tension whatever to being a naturalist; but I have spent nearly all my life working on a farm, and, during fifty years of close contact with nature, I have seen what I have seen and heard what I have heard; and I am now ready to believe that it is quite possible for a professional naturalist to be very painstaking and precise in his investigations, and very fanciful and misleading in his deductions. Fables have their use, and I do not doubt that stories, in which human emotions are attributed to the lower animals, may serve a good purpose. But they cannot serve a good purpose unless the reader knows enough of the matter to distinguish between the facts and the fictions. Fiction, as an illustration, or confirmation, of truth is all very well, but fiction as a substitute for truth generally begets an enervating sentimentalism, and always obscures knowledge. It may not seem of great importance whether the beasts and birds have languages or not, or whether they are dependent on reason or instinct; and, in itself, it is not a matter of great importance; but it is, nevertheless, a very interesting subject, which has an indirect bearing on human relationships which are important.

I.—Reason and Instinct Distinguished.

For our present purpose I think reason or intelligence may be defined as a consciousness of the relation between cause and effect, or of the relation between thing and thing; and instinct as impulse or inclination to action without such consciousness. Instinct is con-

prehensive discussion of the questions: (1) Have the lower animals a language which is transmitted from generation to generation by instruction, and not by instinct? (2) Do the young of the lower animals need to be taught by their elders to eat, and, in the case of birds, to build their nests, to fly, and to sing?

III.—Have Each of the Species of Beasts and Birds a Language which is Transmitted by Instruction and not by Instinct?

It cannot be doubted that the lower animals have the means of communicating a few crude ideas. But I have never seen convincing evidence that they possess a definitely constructed language such as would be necessary if it is transmitted by instruction. Undoubtedly the emotions of anger and love, and the emotions engendered by danger, the discovery of food, etc., each has its distinctive outcry, or modulation of the voice. But this seems to be merely an instinctive and peculiar exercise of the vocal organs called forth by the occasion, or the situation, and which is hereditary in the species. Even men do not talk love in the same tone of voice that they express anger. No one needs to take note of his words to tell that a man is furious. And the dulcet tones of a lover's voice are as expressive as his articulations. And why should not the beasts and the birds express the very few definite ideas that are essential to their simple existence by a few instinctive and hereditary outcries? It seems altogether unreasonable

by imitation, and not by instinct, it seems very remarkable that each kind of bird keeps so persistently to the song of its own species. If such was the case one would suppose that the different species would constantly imitate each other, and that our woods and fields would be filled with such a medley of bird song that it would be impossible to distinguish the species by the song. The possibility of a bird learning to sing by imitation is not questioned. I have had no experience with isolated song birds; but when I raised turkeys I sometimes killed the stock gobbler as soon as he was no longer needed, and left the turkey hens to raise their broods alone. When this was done the young males grew up without hearing a gobble, or having an example set them in strutting, but they always acquired both of those accomplishments in due season. It is very likely that they would have commenced to strut and to gobble earlier, if they had had the old one with them. But the lack of his example did not prevent them from becoming perfectly proficient all in good time. I suppose the gobble may be regarded as the song of the turkey, and if instinct is sufficient for the turkey, why is it not sufficient for the thrush and the vireo?

Hermit tells us that he has seen mother birds assist in nest building in several instances, and that on one occasion he saw a young pair commence to build in a place so unsuitable that the nest fell down; whereupon the older birds assisted the young things to select a better place. But this does not prove that the young birds were unable to build their own nest. Even men, both old and young—the wise and puissant lords of creation—sometimes construct their homes in places that are disastrously unsuitable. I have seen a great many birds' nests in positions that indicated very little foresight on the part of the birds; but I have never seen the least evidence that there is a healthy and mature bird in existence that is unable to construct the nest of its species without the least help from a school-master. If Hermit should tell me that he has seen old Baltimore orioles, for instance, helping a young pair to build their nest, I would not regard it as improbable. I think it very likely that some birds, like some men and women, are unnecessarily officious. But if he should tell me that a pair of young orioles are unable to build their first nest without instruction, I should want him to inform me just how he knows. It would be interesting to know if young spiders require the assistance of their elders to enable them to weave their first webs; and, also, if young bees take a course in mechanical engineering as a preliminary to making the hexagonal cells for their honey and for the eggs of their queen. I think, however, that it is obvious that the caterpillar receives no scholastic instruction in preparing for its transformation into a butterfly, and its cocoon is far more intricate in construction than the nest of any bird.

Instinct may now be a "commoner" in the sense of being less exalted than reason, as it always has been, but, so far from being "deposed," it is still the power by which God preserves and perpetuates all the living creatures of the world. Even men owe their existence to the instinct that impels a new born babe to draw nourishment from its mother's breast. If all the creation was suddenly deprived of instinct, all forms of life inferior to man would die almost immediately. In the case of every creature, but man, even the desire to live and to perpetuate the species, is maintained by instinct only. The human race alone might possibly endure miserably for a generation, gradually perishing amid the general decay of nature.

I. W. G.

The Intelligence of the Wild Things

YUMA, ARIZONA.—*Editor Forest and Stream:* On the "Intelligence of Wild Things," some of your correspondents are inclined to be disputative rather than convincing, by the introduction of new and additional illustrations. Even the pip and peep of the artificial incubator has been pushed into the controversy, and the original charge of "false natural history," made by Mr. John Burroughs, has been wholly lost sight of. Probably neither Mr. Long nor Mr. Seton intended their human animals and birds to be taken seriously many removes from short skirts and knee breeches, any more than did Kipling his wonderful jungle books. To the old as well as young, they are full of pleasure. Even honest John Burroughs undoubtedly burned his candle low before he closed the book on old Krag. Youth has passed the place where "brook and river meet" before it is willing to relinquish the delights afforded by "Robinson Crusoe," "Arabian Nights" and fairy and folklore tales. If animals and birds can be made to entertainingly talk and act through the genius of Seton, then, by all means, let the bars down very low that all may do so. Those who love animals delight in seeing the lights and shadows of his masterful pen make them outwit their supposedly more intellectual enemies. I do not know anything about Mr. Long, but if he has done no worse than Mr. Seton with the denizens of the woodland, we will forgive him his sins and shortcomings and pray for a little more of the same sort.

Before closing my "butt in" I would like to call attention to an editorial note in White's Natural History of Selborne, Chatto & Windus, Piccadilly, 1890, page 89. It says:

"There has been much controversy among naturalists whether the notes of birds are innate or acquired; the greater part of which has originated among those who argue on general principles without experimenting. We have ourselves instituted these experiments, and have proved clearly that the song of birds is innate. We have brought up repeatedly broods of young chaffinches, and they invariably sang their native notes when they arrived at maturity; and this without the possibility of their hearing the song of their kindred. Nay, on the contrary, they were brought up in the same room with a gray linnet, and never acquired any of its notes, but had their peculiar notes, which cannot possibly be mistaken."

PAPAGO.

Songs of Birds in Confinement.

Editor Forest and Stream:

I will never believe that training does not play a large part in the mental development of a bird or animal. We are told that chicks will commence to scratch and young ducks take to water the moment almost after they leave the shell. Undoubtedly all birds and animals have primary instincts, and the impulse to hunt for food is of course one of the strongest of these. But I contend if these primary instincts were not supplemented by a course of practical instruction they would not have much chance in the struggle for existence.

Take the chick or the young duck referred to, in a state of nature, and deprive it of its mother. It may be able to pick up a living and it may not, not knowing where to search, but how long will it escape the fox or the hawk?

We have all read of Little Red Riding Hood and the wolf. I could weave a very similar tale out of the chick and the fox, or the young duck and the hawk. All the arts of eluding or escaping from enemies—all the superior cunning in hunting for food—all the general intelligence in promoting well-being and longevity are the result of training and experience.

But, say the hard-and-fast advocates of the instinct theory, how do you account for a bird in confinement learning to sing? To this it may be answered that the song of a bird properly bears no relation to knowledge. It is as much a part of the bird as its plumage. Otherwise, it is the effluence of the bird-soul, so to speak, and its *raison d'être* is love. It is independent of circumstance or environment, and only requires the amatory influence of the spring to make it gush forth. The bird takes no thought of it—it wells up within it all spontaneously. Nevertheless there are some birds which sing much better than others, and of course a young bird is helped in its early essays by listening to an old bird; but it would sing its song ultimately if left entirely to itself, as we see in the case of caged birds. However, I have never known a caged bird to sing with the same verve and variety as a bird in its native wilds.

Perhaps I should note an exception, viz., the canary. But this bird is so accustomed to the cage (I fancy it has been a family pet for centuries) that confinement has become a sort of second nature to it. The thrush, the mockingbird, the lark and other imperial songsters all obviously pine in confinement, lose heart and spirit and sing in a subdued, broken fashion. I confess I never see one of these birds behind bars that I do not feel inclined to break the bars. The man who will cage a lark deserves almost to be caged himself. He is a lover of nature, I suppose, but he is also a man who does not love liberty except for himself, or at least he is thoughtless and selfish. He wants to sit in his shirt sleeves on Sunday morning with his pipe in his mouth, as I have often seen him in rural parts, and have the lark sing for him. The song he hears, however, is O so different from what he might hear if he only took the trouble to go out into the fields and woods.

I was in the Zoological Gardens in Philadelphia some time ago and heard a British blackbird (*Turdus merula*) sing in its cage in the aviary. Anything more plaintive I never heard. There it sat on its little perch, amid squalid surroundings, uttering at intervals its mellow notes, which seemed to vibrate with yearning and regret. Its eyes were half closed and I could imagine that while it sang it was dreaming of its far off home—of the thorny hedge or brake, with the wild gleams of a watery March sunset playing upon it.

Turning from this pathetic picture I was confronted with one which was at once pathetic and humorous.

A bird (the Poë honey-eater of New Zealand) with the general resemblance of a starling, only larger, and with two little white curling feathers set in its neck like a parson's cravat, sat on its perch also a-singing. The song, however, was about as different from the blackbird's as could be, being a voluble emission of shrill, jerky notes, interrupted occasionally with a squawk, and ending with a sound like the popping of a cork. It was decidedly a humorous performance, but it had its pathetic side, too, as I have said, and this consisted in the seeming frenzy of the bird. One could have imagined that it was actually choking from the excess of its emotion.

There is little doubt that birds reason after a certain elementary fashion, and there is no doubt whatever that they remember. They remember especially where they were born, and return to the spot year after year if they escape the chances of migration or survive. It would be going too far, of course, to suppose that a young bird taken from the nest and put in a cage bears any memory of its early surroundings, but we may be quite sure of this, that it is conscious in a dim way that the cage is not its natural environment. It will often mope or sit a-brooding, as it were, or take a sudden mad fit and beat its wings against the cage till they bleed even, and when it sings its song is only the ghost of its real self. Some birds will not sing at all in confinement; this is true especially of the nightingale. It seems the greater the genius, or the higher the nervous organization, the heavier falls the loss of liberty.

Assuredly the song of birds is half the charm of a woodland. Who that has stood in the recesses of a deep forest has not realized the pervading sense of loneliness and melancholy because of the absence of it? Now, on first blush it would seem legitimate enough to import this woodland music into the household, but for the reason that it loses its setting there and fades into comparative insignificance and more especially for the reason that a piteous wrong is involved the practice should stand condemned.

We are all acquainted with the sentimentalists who raise a periodical cry against shooting, and yet these, for the most part, are the very persons who do the caging. I suppose they will never be able, from their peculiar mental make-up, to understand that it is far more humane to shoot a bird than to put it in a cage.

The Things Men Kill.

"The evil that men do lives after them;
The good is often interred with their bones."

It would seem that the art of journalism, like any other effort of man, can never be made perfect or faultless. There is bitter and sweet in most of the things mankind has to deal with. A journal, in particular, that expects to enjoy influence and respect must say things that are bitter to some of its readers. Its judgment, in its adherence to truth, is the rock of its foundation. I hope to be excused for contributing to these columns some bitterness for some readers.

In the Sunday Examiner, one of the great newspapers published by William Randolph Hearst, in San Francisco, Chicago and New York, there appeared, May 31, a full-page picture and an article by the artist, Homer Davenport. The picture, crudely drawn and printed, shows the "State Dining Room" at Washington, as the artist has seen fit to arrange it in his caricature. The walls of the room over the dining table are shown to be adorned with the mounted heads of a bear, a moose, a deer, an eagle, a wild ram, a boar, an antelope, an elk, a buffalo, a moose, a puma and a tiger. All of the trophies are apparently American except the tiger's head.

The picture is good enough, for its kind, but the article printed under it, over the signature "Homer Davenport," is not only a kind of libel upon the President of the United States, but it is insulting to American sportsmen, if not to the bone and sinew that has reared the greatest commonwealth from a wilderness that a hundred and fifty years ago was populated exclusively by wild beasts and savages. Whether this has improved the face of the earth or has marred it does not so much matter. The pioneers with rifle, ax, energy and character made it possible for Mr. William Randolph Hearst to publish three of the greatest daily newspapers, employ Mr. Homer Davenport, and incidentally aspire to the Presidency of the United States.

Under the mounted heads in the picture Mr. Davenport has placed the words, "I killed," etc., and one paragraph in his article reads as follows: "If Mr. Roosevelt cannot enjoy his meals except in the presence of the stuffed remains of his victims, it would have been better to decorate his private dining room with them instead of bringing such horrors into the State dining room."

The illustration and the article, in its attempt at covert insincerity, cannot well be construed as anything better than rude and envious slander. Such trash is misleading to many people simply because the newspaper goes broadcast and is read, or seen, at least, by hundreds of thousands of readers or persons. Among them there are doubtless others who know and understand as little of the ethics of sportsmanship as does Mr. Davenport himself, and that is saying much in few words. If his article was published enviously, because the State dining room is not decorated with his own conceptions of artistic adornment, he is not likely to profit by it. If it was conceived and executed to detract from the popular personality of Theodore Roosevelt, it will not lose him friends other than the President can spare. In publishing such work of Mr. Davenport Mr. Hearst will not, in all probability, gain much intelligent influence, even with three "largest printing presses in the world."

Men are the most destructive animals in the world. Much of their energy, reason and execution is devoted to arts that annihilate, destroy and renew, for better or for worse. Every civilization in the world's history has been built upon the graves of wild beasts and savages. Civilization itself feeds upon flesh and blood, and under its ponderous tread things good and beautiful are ground to dust with the things otherwise. Man is no better and no more merciful than nature, but some men are honest in their efforts to be as merciful as possible. Men who publish great journals that are printed on both sides are not always of these. Some great newspapers advocate every virtue on one page, and upon the next advertise all sorts of things, for they need the money thus obtainable. Such men are even more destructive than those who kill bears and moose and mice.

A very pathetic picture, and a most moving homily, may be drawn and presented of men killing bears with suckling cubs, slaughtering beautiful and graceful deer or tigers, but the talents of any sincere artist in this world may find better and more effective use for humane impulse. Let those artists depict some of the amendable inhumanities under their noses in any civilized community upon which they subsist. Let them depict something miserable that they can make better, or at least attempt doing so. Go into the artistic parks of the cities and show how people with highly cultivated tastes drive and torture noble animals known as horses with the family carriage at their tails and overhead checks on their patient, beautiful heads. How many policemen with clubs does it take to keep the people of a great city from preying upon each other without special legislation?

President Roosevelt will scarcely find it necessary to defend his "personality" against the attack of Messrs. Davenport and Hearst. At present the President does not appear to be engaged in killing as many things as he might if he was in a very bloodthirsty mood. In fact, it appears that there are imposters abroad with endless rolls of white paper and barrels of black ink, and with these materials and mighty printing machines they are endeavoring to renovate the world. With the addition of some wisdom and good clear brains they would be most excellently well equipped.

There has been quite enough of the bogus sentiment of imposters and idiots put into type by ignorant publishers, but there is no way of stopping it, any more than there is of preventing fools and politicians from exercising their privilege of free speech. Intelligent people cannot but know that sportsmen worthy of the name are as humane and refined as any class of people in the United States, or any other region. It is a commendable trait for sportsmen to preserve as best they may the trophies they win

under arduous and often dangerous circumstances.

In my opinion the country we live in has produced no better specimens of humanity (and the world is proud of them) than the pioneers and hardy frontiersmen who handled and yet handle the rifle and the ax. They are the men beyond all others who, gaining a foothold upon Plymouth Rock, free from old time tyranny, defended the new world against all comers and have hewn the things out of a wilderness of savagery that the entire world looks upon with wonder, astonishment and respect.

The pencil and pen of Homer Davenport, and all the printing presses of William Randolph Hearst will not disparage hunting or shooting instincts in men. Men must eat that they may live, and not all of them can do it at the expense of or through the efforts of other men. Men kill many things. Perhaps it is a good way of knowing a man to know what he kills and the manner in which he does it. It is no more the chief object of a real sportsman to kill than it is for any other man. When Mr. Davenport or Mr. Hearst eat they are perhaps able to pay some one else to kill for them, and it may be much easier and more to their liking. They may, however, eat forty oysters or a hundred shrimps with several other kinds of meat for a dollar or two without knowing who killed the animals. They merely pay to have it done, and may not know a shotgun from a shrimp net.

But men are not made in dining halls where all kinds of things are brought to them upon a platter, including newspapers. Men have been reared in the woods where they never saw the inside of a hotel or of a daily paper. In many cases it is the men who kill animals directly who are most active in preserving and increasing the animals for a useful purpose. The men who shoot game are at the present time the men who are most earnest in the efforts to protect and provide for it. Who ever hears of any one but sportsmen doing anything to protect game animals or birds or fish? A man who is not a sportsman in some degree knows little of the world he lives in, however he may wield a brush or a pen. The man proficient with the rifle and the ax deals with things other than theories.

CHARLES L. PAIGE.

SHASTA, Cal., June

Fences in the Adirondacks.

Editor Forest and Stream:

Who shall decide when doctor's disagree?

Two men of equal ability may be as wide apart in their opinions on a question as black and white, but neither will be convinced that he is wrong. A few weeks ago Mr. Spears asserted his belief that many of the Adirondack fires were incendiary, and though he did not say anything in favor of such a devilish mode of revenge for real or fancied wrongs, the friends of the millionaires have opened their batteries on him as savagely as if he had committed wholesale murder. Admitting the existence of the villainous fire-bug is not assenting to his mode of getting revenge. Mr. Avis seems to consider it almost a crime in Mr. Spears to say "his personal feelings in this matter are very strong, as are the feelings of all the other backwoodsmen, in fact." I fail to see how that can astonish anyone who sees human nature as it is.

My feelings in this matter are also very strong, although it can never affect my interests in any way. I simply look upon it as affecting the principle of the greatest amount of pleasure and happiness to the greatest number. Mr. Avis says, "preserve owners legitimately acquire land and strive to perpetuate the forests and the game." He has seen how their system perpetuates the forests! I also want to see the forests perpetuated, but by a more unselfish and certain process. As long as a few millionaires continue to take advantage of their power to deprive hundreds of their fellow men of privileges that they have all their lives enjoyed, and all for no additional pleasure to themselves, except the pleasure of shutting it off from others, they must expect to encounter the disagreeable phases of human nature as it is.

If there is no such thing as human depravity, why did the great Connecticut preserve owner offer a reward of \$2,000 for the detection of the fiend who fired his preserve? I find him standing side by side with me in that belief.

Will Mr. Avis also tell us, if all men are too saintly to gratify revenge, how it is the basest murders are committed every day throughout the world to avenge some real or fancied wrong?

Another contributor of FOREST AND STREAM last week made mention of a summer visitor who was asked to help put out the fires and who answered that he would rather help set more. That man had undoubtedly been accustomed to enjoy himself in the woods in summer, but finding himself cut off from all his former pleasures he gave his bitter feelings vent. "The right to buy and sell land has been recognized for centuries." None but idiots doubt that, but if a man is a believer in the golden rule, can he believe it right because legal for a single club of millionaires to buy up the whole Adirondack region merely for the purpose of depriving their fellow men of any enjoyment in it? Legal or not legal, if I could have my way, the State should buy up all the wild land and never sell more than 5,000 acres to any one man or set of men. That is the only way I see of stopping complaints against the boundless monopolies.

Mr. Avis finishes his tirade by saying, "There are few men with one iota of reason will believe they were the work of the criminal fire-bug." That may be modest, though it doesn't appear on the surface. It looks rather like an intimation that those who disagree with him are idiots—"of which I am one of 'em."

DIDYMUS.

ST. AUGUSTINE, June 27.

Editor Forest and Stream:

Why is it that so few people seem to see the point of view of the opponents to the fenced preserves of wild land? Is it because the men who object to preserves have not "one iota of reason?" It is on this question that my personal feelings are very strong.

To my mind the question is simply this: In the Adirondacks there is a limited area of wild land. It is the only wild land worthy of the name nearer than Maine or West Virginia. If this land here is "preserved" there is no

place to which I can go and enjoy nature as God made it, for I can't afford the expense. I am a poor man, but I try to do my duty toward the State, and when my work is done I feel that I ought to have a place for recreation. As my work is done for the good of the people, I hope, I feel that I ought to have a place where I can become ready for more and better work. My taste is toward the wild woods, which I can't afford to buy. There are thousands like me right in this New York State. The only wild lands in this State are being bought up and fenced in, and we, whose hearts are bent on being as good citizens as we know how to be, are being fenced out of this wild land. This land ought to belong to the State, and not to private individuals, a large part of whom are skinning the woods under pretense of "forest preservation and timber culture."

As to Mr. William H. Avis's remark that "there are few people with one iota of reason will believe they (the forest fires) were the work of the criminal fire-bug," in Warren, Lewis and other Adirondack counties, several men were arrested on the charge of setting fire to the woods. Some were convicted and some freed.

As to my personal part in fire fighting and locating the sources of the blaze, my services were at the command of the local fire warden, according to the law, and to my own inclination. The information that I had was given to him, though it was not much. As to the firing of game preserves, my information came in part from one of the foremen of the fire fighters on a preserve who got near enough to see the heels of a fire setter. In "Adirondack Ruin" of which Mr. Avis speaks, I tried simply to state the facts and their causes, with a note to the effect that I was biased in favor of the woodsmen and people in general who cannot buy wild lands for preserves. This was only fair to the readers of FOREST AND STREAM. Every acre of the Adirondack forest ought to belong to the State, and it is an outrage on the people at large that in this region, plainly meant by every indication of its rugged surface to be a great and beautiful park, there are miles of fences with the signs of "Shooting, fishing and trespassing forbidden" at intervals along them.

I agree with Mr. Avis that there "are few beings more despicable than the fire-bug. The fire-bug, the poisoner, the anarchist—the anarchist a gentleman compared with the two!" One of the few worse beings is the strong man "who takes that which not enriches him" but makes his victims poor indeed, the strong man who, because he is strong, imposes on the weak. It is an imposition when a five foot eight man preserves fifty thousand acres of land by reason of his money strength, when plenty of weary six footers—tramp clerks and printers, if one wishes—are obliged to keep to the roads for fear of the law against trespassing on untitled wild lands. One hundred men, at the rate of many Adirondack land holdings, could shut out every one else of the five millions in this State, of whom a hundred thousand enjoy the, as yet, unincircumscribed forest lands of the region. Does Mr. Avis, or anyone else believe that one hundred men ought to be allowed to do that? The State owns some land in the mountains which cannot be sold—as yet! The rest of it is being taken up and "preserved." This "preserving" is a menace to the health of every visitor who comes to this region for health or rest—curious as that may sound.

RAYMOND S. SPEARS.

N. R. THWOOD, N. Y.

The Meadow Lark in Kentucky.

LEXINGTON, Ky., June 27.—*Editor Forest and Stream:* In your issue of Saturday, May 9, 1903, Sandy Griswold, writing of his interview with Rev. Robert E. Le Craig, makes the latter state that in Kentucky the meadowlarks "are not protected by law at all." The law in Kentucky against killing people, and indeed other things deserving protection, is ample; the difficulty is, as Rev. Craig's confession shows, that it is not respected, even by the clergy, and is not enforced by those upon whom the duty devolves. Section 1946, Kentucky Statutes, in express terms prohibits the killing of the meadowlark, and Section 1949 provides a penalty of not less than five nor more than twenty-five dollars for each offense.

GEORGE B. KINKEAD.

West Virginia Deer Limit.

MORGANTOWN, W. Va.—*Editor Forest and Stream:* Our State has recently passed laws to protect squirrels and rabbits, which have heretofore been unprotected by law. A law has also been passed limiting the number of deer which anyone may kill in one season, which has heretofore been unlimited. As it now is, the deer hunter must curb his passion for killing, and stop when he has killed ten deer. Perhaps the less said about the wisdom of such law makers the better.

EMERSON CARNEY.

Several days ago, says the New York Times, a stray horse was found on the Hudson Boulevard, Jersey City, and was taken to the stables of the Society for the Prevention of Cruelty to Animals. John Heins, a West Hoboken florist, called at the Society's office yesterday and claimed the animal.

"How are you going to prove ownership?" asked President McCarthy.

"Don't have to," said Heins. "If it's my horse he'll prove the ownership by doing some tricks I taught him. If it isn't my horse I don't want it."

"They went to the stables, and Mr. McCarthy told the stableman to turn the horse loose in the yard."

"Come here, Jack!" called Heins as the animal came out.

With a whinny of delight the horse ran over and rubbed his nose against Heins's breast.

"Shake hands," said Heins. The horse carefully lifted his right forefoot and placed it in Heins's outstretched palm. Heins walked over to Mr. McCarthy.

"Jack," said he, "take out this gentleman's watch."

The horse took the President's watchchain between his teeth and gently pulled the watch from the pocket.

"All right," said President McCarthy. "I guess he's your horse."

Heins took the animal home.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Sunrise on Lake Washington.

A GOLDEN light kindles the long stretch of rushes and feathery willows upon the southern borders of the beautiful lake; one grand sweep of dark and light green fields and woods covers the remainder of the scene, while to the northwest stretches the silvery stream of the home of the black bass and the mottled pickerel. The picture is soft and rich, yet with an indescribable wild beauty about it, steeped as it is in the mellow charm of dawning day.

Frank Fanning, one of the most interesting and versatile of all the guides up there, is at the oars, and rows away from Sheehan's landing, off through the Narrows. On our right is a selvedge of light fluffy rice stalks and rushes, backed by flowering dog wood and swaying maples and an expanse of waving wheat and rye fields, with graceful wooded acclivities between. On the left are the craggy bluffs, with their shaggy oaks and glistening boulders separating one arm of Shantaska's blue waters from the other. The breaking sunlight lies like a topaz mantle over the exquisite scene, its soft rays tingeing the wild rose into deeper pink and making yellow intaglios of the wild clematis and blossoming moosehead, fitting in the crannies of the abrupt shores. The Narrows widen as we proceed, with thickets of rushes and beds of aquatic moss lining the crystal channel, while back of us it dwindles into a sheeny streak, rolling and undulating like a water serpent in heavy herbage. Side cul-de-sacs entice our little clinker, graceful as a pike, but Fanning's steady strokes send her skimming through the water like a loon at play.

A thunderpump rises awkwardly from her morning vigil for tadpole or crawfish in the thin reeds along the near shore and fans heavily away down the lake with a plaintive squawk or two, the light touching her slender, brown shape as she bursts into the fullness of the day.

Frank finally slows up as we near the moss beds, just east of the "red barn," and rests gracefully on his oars as I square myself, preparatory to casting. I first try of recognition from glorious old *Micropterus* at the mouth of the little bay, polka dotted with the broad, yellowish dishes of the spatterdock and starred with white and golden water lilies, which opens coyly into the swaying tules. Dropping my frog adroitly here, flinging there, I tease the lazy waters, but in vain.

Not a strike rewards my feverish impatience.

Fanning picks up the oars and with gentle stroke sends the boat up closer, where the water is more shallow and the moss heavier. I skip my weedless over the rippling surface, specking the dark green, sleepy pools with it, like a huge heron feeding, as I bend to and fro, stoop and rise in the ardor of my work.

The bullfrog croaks among the floating lily pads along the marshy shore; a devil's darning needle flashes athwart the water in a prism of royal purple and gleaming violet, the kine low, winding pastureward up the distant lane, and the pestiferous deer fly hums and buzzes about my ears as if in mockery at my earnest endeavors.

Fanning sits idly in his seat, indifferent to everything save the pearly bubbles eddying away from the softly rocking boat's side.

Softer still, through the shimmering morning haze, the sun sheds his rays over the scene. On the left bank the trees and alders are thrown into the glassy lake by the most delicate penciling, forming a series of fairy paintings, entrancing to look upon, specked as they are with the topaz, the crimson, the garnet and lapis-lazuli of the glancing sunshine, paintings that you may search for without finding throughout any and all of the Parisian galleries and salons. From the gnarled trunks of the aged oaks to the serrated edges of the leaves, everything on the margin is depicted in the lake as if its waters were one wondrous mirror.

Suddenly we find ourselves moored in a net work of floating moss, and *Salmoideus* makes assault after assault upon my frogs, and for two hours no waters in the world could furnish better sport. In that time a dozen bass or more, in the blazonry of their splendid armor, are flopping and gleaming in a bed of willow sprigs in the bottom of the boat.

There! my lure strikes a placid pool, back and beyond the first line of tules, where the sunlight glares like the orb of a basilisk.

"Hey!" I cry in excitement.

"Steady!" echoes the guide, aroused at last from his lethargy.

Off the stricken fish darts like a ball from a gun. Down he dives as he rushes out into the deep as if he would penetrate the lake's bottom. Then up he comes again as if to clear the aqueous barrier and take a flight through the ether. As his yellow spotted sides flash in the sunshine, we see what it is.

Esox lucius!

The tiger of the waters—a fifteen or twenty-pound pickerel!

Back into the depths he plunges like a metal projectile. The slender rod bends and creaks threateningly. I am thrilled with the excitement of the moment. Frank an immobile looker on. He knows I require neither advice or assistance as yet. There is no surcease from agony in the chilly depths, and the big fish breaks the surface again. Here he launches out desperately and spins around with almost inconceivable speed. I play him with the skill of the master who taught me. Now I give him rope with which to eventually hang himself; now I reel in as fast as my fingers can turn the small crank; click-click-clickety-click, my Shakespeare sings, as I give him length again. I have the bamboo's butt planted in the pit of my stomach, while I hold on deftly with my left and work the crank with my right. My countenance must have betrayed my anxiety, but I preserved my equanimity, always keep-

ing the contorting, threshing and convoluting savage of the lake, like all good anglers would, taut upon the rein.

But the huge pick is game to the core, and yet he soon cavorts with decreasing desperation, and his movements become slow and sluggish. I see his long, slender, golden shape plowing boatward near the surface. He will soon be mine. One more wild, frantic lunge for the moss bed—one more heroic dash for the deeper waters, one more swirl and turn, and with a sense of conquering security, steer him toward the boat's side, where Fanning crouches. He is weary and drowning. Yet I reel him in with unlessered caution. Suddenly there is a glitter beneath me; a spasmodic flurry, and a stubborn out pull. Frank leans over, makes a sweep with his naked brown arms; the yawning net is under him, and the next instant a seventeen-pound pickerel is convulsively floundering in hopelessness and despair among the willow tendrils at the bottom of our boat.

THAT evening at the Red Squirrel's Nest my big pickerel furnished the main theme of conversation, and I listened to a most delightful rehash of the old muscally-pike-pickerel problem, probably the most vexed of all ichthyological mysteries. And there was a distinguished coterie of skilled anglers and scientists there, too, assembled on Pat's wire-screened piazza for the post-supper cigar and inevitable swap of the day's doings. Fanning had been compelled to bring my big pickerel from the ice-house and lay him out on the grass for the inspection of each incoming boat until all had critically passed judgment upon him, and in the evening, it being the record catch of the year, the one theme was of course this self-same fish.

For once I proved a good listener, and by lumping the diffusive lore of the party combined it was easy to see how the pike family is such an interesting one, containing, as it does, many of our best known and most widely distributed fresh water fishes.

One mild-voiced Sioux Falls stranger, a Captain Alexander, timidly intimated that the fish was a muscally, but he was sat down upon by about six of the eight or ten authorities (?) present with more vehemence than courtesy, I thought, and yet he remained mistaken in the belief he had expressed. Ed Holbert, one of the besan-neled guides, was sure that it was a great northern pike, but Judge Ogden, Dr. Owen and Pat himself knew it was a common pickerel.

"I do not believe there was ever a muscally or a great northern pike taken in these waters, eh, Pat?" and the Judge turned to Sheehan.

"Yes. They say in the early days that the loggers speared a good many muskies here, and if that was true, there certainly were great northern pike here, too; but there hasn't been any of either, to my knowledge, caught here in twenty years."

"That convinces me," ventured the Sioux Falls man, "if there were muscally here once they are here now, and I believe Mr. Griswold's fish is one of them—maybe the last remnant of a noble race."

"No, Captain, I think you are wrong," interjected the Judge. "I take little stock in these old lumbermen legends of Pat's, and yet I will confess that the identity of these fishes is something that I have never had satisfactorily demonstrated to me, and the controversy about them is as varied, indefinite and endless as the orthography of the name muscally. And, I might add, that I believe the points of demarcation between the muskie and the great northern pike are so similar that it seems almost useless to try to classify them."

"Well, so far as I am concerned," continued the Captain, persistently, "I think that the so-called muscally is nothing but a pike, as described by our patron saint, Izaak Walton—the great northern pike. When he is small he is the pike, when he grows larger and his habitat is more given to deep cold water, with a continuity of rocks and adjacent moss beds, his color and his markings undergo a considerable change, and his great strength and agility become more in evidence, and then it is that many believe it another fish. I say that the color should never be used as an infallible guide to his genus or species. The discoloration of certain waters make these apparent incongruous distinctions. Take the Caucasian and transplant him to equatorial Africa and his skin will very rapidly become dark. Now, in the Wisconsin lakes the muscally is a dark green in general color, and the larger specimens are devoid of spots and their markings are not as brilliant as those found in this State. The plentiful growth of the tamarack over there is said to be the cause of this difference. The fin formation, the pectoral, dorsal, caudal, anal, and ventral, as well as the bone formation of the muscally, great northern pike and the pickerel are identical, and no author of reputation differentiates in these particulars. Why, what does David Starr Jordan, Ph.D., and Barton Warren Evermann, Ph.D., say in their late and popular work, 'American Food and Game Fishes?' They say of the great northern pike, *Esox immaculatus*, 'this muscally is known only from Eagle Lake in Northern Wisconsin and Minnesota. From the Great Lakes muscally it differs in having the body entirely unspotted, or with vague, dark cross shades. The tail is a little more slender and the fins a little higher. This form has not been studied critically, and its relations to *E. masquinongy* and *E. ohioensis* have not been clearly made out.' Now, with me, that settles it; the pike and the muscally are one and the same fish."

"As you are aware," followed up the Judge, "a majority of our most learned authorities say that the pickerel has no scales on the gill cover or cheek, while the great northern pike has scales on the lower cheek and gill cover, while the muscally has scales on both."

"Yes, I know that, but these slight differences, I think, are sufficient to make us doubting Thomases. These scales may be the result of old age, or other causes of nature with which we are unfamiliar and do not comprehend; but I do not believe these incongruities ample to create a difference in the fishes, and I am sorry conviction compels me to attempt to dispel pet illusions, romances and ideals which have for decades been so dear to the muscally angler."

"Muscally, pike or pickerel," joined Dr. Owen, "Sandy's glory is undimmed. It gave him a royal battle, and, I wot you, properly placed upon the table, the gastro-

nome doesn't live but who would acknowledge that it would be as delicious under any other title. We all know that the pike family contains some of the best known fishes, among which are some of the largest and most formidable inhabitants of our inland waters. The so-called great northern pike and the muscally are not beaten in size by any of the fishes I know, excepting the giant catfish of our own Missouri and Elkhorn rivers. Some of the salmon may be larger, but I am not familiar with them if they are. There are also several small representatives of the family; as, for instance, the little banded fellow of the Platte and Rawhide. That the pike-pickerel is an old-timer is demonstrated by the fact that their remains have been found in quaternary deposits and in fossilized form of the diluvian marl. And if you examine their teeth it will surely inculcate a healthy respect for them."

"You bet it will," interpolated guide Fanning from his seat on the porch floor, "and if a fish like that Mr. Griswold brought in to-day should get a man's finger in his mouth he'd snap it off as cleanly as it could be done with a hatchet."

"Yes, indeed, a man must be careful in unhooking one of these fellows," added the Judge; "the roof of the mouth contains a middle row and two side rows of teeth, while the tongue and pharynx are veritable buzz saws, and even the gill arches bristle with little lances on slide-like plates."

"Yes," from rower Holbert, "and along the lower jaw there is a row of teeth that would make good shoe-makers' awls, and you want to be careful in handling one even a fifth the size of Mr. Griswold's, for their fancy for nabbing and holding on is about the same as a snapper's."

"Well," and the Judge rolled a cigarette, "it is a fact that the whole question is a confusing one, for we all know that in many localities the pike is a pickerel, and in others the pickerel is a pike. The name pickerel is common all through Nebraska, notwithstanding the fish in question is truly the pike. Up here in Minnesota the misnomer is not so common. The origin of the name—well, I don't know where that came from—"

"From the old day lumberman's pike," interrupted Pat.

"Probably," patronizingly from the Judge, "but in the old country the same fish has many different names; in England they call it the jack and luce, while to the French anglers it is the brochet; to the Germans the hecht, and to the dagoes, luccio. The fish is found in all the Polar regions of the world, and here, in this country, it prevails from the scant waters of Kansas to the frozen seas. Fred Turner tells me that it is common in the Klondike rivers, especially the Yukon, where it is called by the natives the chuck-work."

It was nearly midnight when the assemblage dispersed, and I must confess that out of all the mass of stuff I listened to I was unable to determine just what my big fish was—a pickerel, pike or muscally, and the nip of Yellowstone that the Judge and I indulged in when we reached our suite was a long one and a deep one I can assure you.

But before closing I wish to remark that, next to the bass, the pickerel is Lake Washington's crowning glory, and many enormous specimens are taken here every summer—the record breaker being a 28-pounder. Pickerel are caught all through the summer and were, formerly, all through the winter, but the new law prescribes open and close seasons, the same as for all other game fishes. Ice fishing and spearing was at one time the chief pursuit of the natives roundabout the lake. The Washington pickerel is a carnivorous beast, and destroys any and all animal life that comes within reach of its shark-like jaws. Pat says he has seen them time and time again pull a wild duck under the water, and young duck and other aquatic birds are a favorite diet of theirs. Up here it is not gregarious, and pairs only during the breeding season. They hunt like sharks, concealing themselves suddenly among the lily pads, tules and mosses, and shooting out and upon their victims with unvarying precision. They spawn in the late winter and early spring, their favorite places being the overflowed meadowlands, which were extensive here this year, and it was on these, too, Fanning, Sheehan and Holbert that the bass largely did their spawning. The period of incubation here is about sixteen days, and the female is the larger of the two fish. Pat says that a yearling pickerel is more fit for the table than at any other time. He is about a foot in length at this age, and of a certain delicate flavor that leaves him when he grows a few months older. He is a great fighter here, the equal of the black bass, and bites voraciously at anything and at almost any time.

SANDY GRISWOLD.

Canoe and Camp Life Along the Delaware River.

XIV.—Realisms.—Fishing and Scenery at the Gap.

"Sportsmanship has more than its share of the comic opera of life, funny and sad, for there is no comic opera so funny that it is free from pathos. And of all the comic opera of sportsmanship, none is more comical than the claim to sportsmanship by virtue of contemplation, or how to be a sportsman without any of the qualities of true sportsmanship. How does it so happen? Because the ego gets into the clouds, returns, and the egotist imagines that his dreams were true."—Forest and Stream Editorial, April 18, 1903.

The artist who sees nature and draws from it an impression steeped in the dyes and impregnated by the atmosphere of his own restlessness or serenity, his own sadness or gaiety of mind, may produce a picture so metamorphosed by his personality of fancy, that it may bear as little relation to truth as a dream to life. But the force of its appeal to other men's appreciation is not thereby necessarily lessened, for they, too, have dreamed dreams. Dreams are as integral a part of our common life, and as universal, almost, as sleep.—Article on Landscape, Edinburgh Review, January, 1901.

SPORT is defined as pastime—diversion. He who makes fishing or hunting a business, and sells his fish or game, is not a sportsman. He who does not observe and derive pleasure from his outdoor environment is a mere fisher or hunter, like one who would spear the sea bass in their pool at the aquarium, or shoot a tiger in a circus-wagon cage.

In other words, it is a truism that the truest sportsman, while loving to fish or hunt, also sees and feels the beauty

of water, sky, clouds, foliage, lights, shadows, hills, and perspectives, and realizes more and more that they all, separately and in relation, have messages of beauty for him. But before he ventures to write of them (an audacious step at best), he should look long at them, and learn, to really see and love them with a love that must clasp so hard that it will crush what is false and hollow. Never, no matter how long and ardently or with what knowledge he may study them, can he hope to tell of them in terms that will satisfy himself or the public, that will, however, always be grateful for careful, vivid, humble words about impressions of Nature. But he must show at once that he has beheld something. And he may be full of enthusiasm. Coldness and want of passion will then not be signs of audacity, but of knowledge. But let him be merely a bungler or egotist, and instantly not only are his words as sounding brass and a tinkling cymbal, but he cannot again arrest the attention of readers, except as they bury him and his false work under a storm of ridicule. Hence, words like those at the head of this article, by the veteran editor of this publication. Hence, weak poems about spring are a target for the shafts of professional humorists.

Mind, this is the inevitable fate of false work. True work wins attention and gratitude. Even when, ruled by that "pathetic fallacy" of which Ruskin speaks, our great poets ascribe a living personality and passion to objects in Nature, readers listen gladly, for "they, too, have dreamed dreams." Thus, a real rhymist safely declares that "music hath charms * * * to softer rocks, or bend the knotted oak." And hear Tennyson in "Maude:"

"The red rose cries, 'She is near, she is near!'"

And the white rose weeps, 'She is late!'"

The larkspur listens, 'I hear, I hear!'"

And the lily whispers, 'I wait!'"

This is very beautiful, although untrue; for there is a *spirit* of truth in the lines, a parallelism with human moods and personalities. That is pleasing, and makes the falsehood welcome. But no tyro can safely use such tools. He will merely produce cheap rhapsody, nauseating fantasticism. The public has suffered long from such writers, and so greatly that a revulsion of feeling has been partially produced, and a taste for the "realism" which deals only with the mean and repulsive. Here are some entries from the diary of a "realist," made while actually camping along the Delaware, for possible use in a "realistic" article:

"Eyes inflamed by smoke from open fire. Dislike washing dishes—no soap, and cannot remove grease from them. Sent for some yesterday and boy stole the ten cents, not returning. Bug got in my ear while sleeping. Took an hour to get it removed. Then flopped down, mad, on sleeping mattress, which burst with my weight. Result, stabbed all rest of night by hard knobs in ground. Whippoorwills woke me before daylight. Tried to drive them away, and fell over a log into nettles. Weak coffee for breakfast, and mildewed bread. Pierce stranger in rags wanted to hire himself out as a guide. Breath full of stale whisky. His suspenders were twisted—one button gone, and a wooden toggle pushed through cuts in his trousers used instead. He was barefooted, and had a dirty straw hat, with its band filthy with perspiration. Trousers stained with tobacco juice. He stole his breakfast by milking one of the lean cows that come to the creek below, and make it muddy as they drink."

All of which proves that Ruskin was right in saying that "You can see only that for which you look, and will behold no more than your nature has capacity to receive."

But it is manifest that toggles doing duty as suspender buttons, tumbling over logs in sleepy pettishness, and a laziness that prevents the presence of soap and permits grease on the camp dishes, are not the objects and subjects most worthy of contemplation. Proper sight of nature will remove the beholder from what is base to what is beautiful—to things which delight, ennoble and instruct. Indeed, her finest moments must be watched for; there will be times of transfiguration that are transitory, and which can only be arrested by a memory that itself must fade—moods only to be appreciated by vanishing instants.

Thus "realism" is the gospel of degeneration. There can be no pardon for a writer who chooses mention of miry, foul ooze in a bog, rather than such subjects as the undulating intersection, grace and music of boughs and leaves, and vistas of trees along their own wild cathedrals. Let the sportsman not seek for malodors of decaying fish along the river shore, but rather for messages unrolled to him along the open sky where colors change with inconceivable cautiousness of delicate gradation, from blue at the zenith to deep green along the horizon. Let him ponder upon the splendors of the evening watch-fires set in clouds, and let him demand of his eyes and soul, some open knowledge of the beauty in the morning rainbow that pulsates in the mist of the rapids. Let him watch the arrested sunbeams, "guests from the far-away court of the sun," that contrast with the half-shadows along and through crannies of foliage in banks and masses, and the curvatures of rocks and hills. This is the true and vital realism.

So-called realism is even more self-conscious than rhapsody, and with more offensive assumption of Delphic insight. For example, after he had partaken too generously of what was probably a badly cooked New England dinner, and must have been suffering from indigestion, Emerson was guilty of the following prize samples of asininity and cockchafer strut. See his Essay on Nature:

"The whole code of Nature's laws may be written on the thumb-nail." "So poor is Nature * * * she has but one stuff to serve up all her dream-like variety."

"Some sad, sharp-eyed man sees how paltry a game is played." (By Nature!)

"Flowers so strictly belong to youth, that we adult men soon come to feel that their beautiful generation concerns us not; we have had our day; now let the children have theirs. The flowers jilt us, and we are old bachelors with our ridiculous tenderness."

"Trees are imperfect men, and seem to bemoan their imprisonment, rooted in the ground."

And note how poetry can be poisoned and made offensive by unconscious "realism." In the much bepraised blank verse, "Thanatopsis," by Bryant, he calls the ocean a "gray and melancholy waste." It is not gray, but blue,

LOOKING DOWN THE DELAWARE FROM MT. MINSL.

It is not melancholy, nor a waste. The ocean is what Ruskin calls it, a majestic "emblem of unwearied, unconquerable power—wild, various, fantastic, tameless unity, full of glory, beauty, and eternal changefulness of feeling."

And then Bryant asserts that the brooks "complain," and "make the meadows green." They do not complain, but sing. They no more make the meadows green than they do the trees along their bluffs. He calls the woods and rivers "solemn decorations all." They are glad decorations. He says that earth is "the great tomb of man." Earth is a magnificent heritage and special home for man.

Finally, observe the same poison of "realism," or rather untruth, spoiling the celebrated couplet in Gray's *Elegy*:

"Full many a flower is born to blush unseen,
And waste its sweetness on the desert air."

The air which blesses any flower is not desert air; the flower does not waste its sweetness, although it may blush unseen, for Nature is perfect in herself, needing no human companionships.

Besides, Gray purloined this idea, and most of his words, from the following couplet by Young, which is also poisoned by false "realism":

"Pure, gurgling rills the lonely desert trace,
And waste their music on the savage race."

In Nature are boundless truths—truths of tone, power, life, space, sound, motion, shadow, hue, relation, fitness for and faithful discharge of function, divinity, brilliance, and purity; endless thoughts, and most gracious purpose. Viewed only from the standpoint of "realism," men do not secure real grasp of mind and sight—"all the voices of Nature one song of rejoicing, all her creatures a glad company." "Realism" makes the very stones cry out in woe at our earthly lot. It is the refuge and diet of the pessimist, and the excuse of the blind. Loving sight discovers the royal seal upon all. "The keenness of our vision is to be tested by the purity and expansiveness of our love." Even the cynical, crabbed Carlyle said: "See deep enough and you see musically; the heart of Nature being everywhere music, if you can only reach it."

Yet in proportion as men really behold Nature, they hesitate at attempts to describe her. Ridicule will leave no sting for such men, and sophistry and weakness of denial will but deepen gratitude. But Nature's own beauty will surely humble to the dust, bringing fear and hesitation when such a devotee tries to tell of her on canvas or in words. Look at this picture of one scene at the Water Gap. Would you call any fisherman there a true sportsman who was blind to all that beauty, and thought only of his fishing?

The island shown in the upper right-hand corner of the picture is reached by a foot-bridge (not shown in the picture) from the Pennsylvania side. From the island a ferry by dory is used to reach the Jersey shore on the right: for remember, this picture shows the river extending into its hills, looking north, and up the stream. A walk of a thousand feet up and along the Jersey bank brings the sportsman to the O'Brien house, standing in woods, and where boats may be rented at low rates. There is a splendid eddy formed by the swirl of the river, just below the second pier of the railroad bridge shown in the distance; and there are many large bass there, as it is deep water. It can be reached from the O'Brien landing by crossing the river, and wading, hauling the boat up stream about four hundred feet close to shore, until the rapids are passed. In the deep water just below the bridge, I have often seen, from a large rock, from four to eight bass that would average three pounds each, swimming about lazily. Alas! they have been fished for so much that they have become very shy. The eddy shoals rapidly to the edge of the rapids; and just before they break into foam, there is a stretch of comparatively shallow water that should also yield good results to the angler. Below the bridge the Ananyming stream empties

through the right bank of the Delaware, its own banks being very low for several hundred feet near its mouth—this wide, stony waste being a favorite place for securing the helgramites that lurk under the stones, and which are such good bait for bass.

Six or eight hundred feet above the bridge, that part of the river known as the Benekill joins the main stream; and at the lower point of the island thus formed, is an old, sunken, upturned tree, around whose stem and roots very large bass make their home, as it affords safety from the sweep and grind of ice when the gorges break in winter.

The Benekill is a delightful little side display of the river, and passes between wooded banks where many overhanging trees glass themselves in deep, black pools, the homes of more large bass. About a thousand feet above the bridge, on the Pennsylvania shore of the Benekill, is a fine spring, not over ten feet distant from the stream, and about three feet above its surface at normal height. That is a delightful place for a noon luncheon. Back of it are wide patches of wild strawberry plants. The writer has picked a six-quart pail of wild strawberries in those fields in two hours, and obtained that rare dish, even among epicures, a short-cake made with the wild berries.

There is a long bank of noble, lichen-covered rock running along the Jersey shore above the bridge. The deep water into which it disappears at an angle of sixty degrees is another favorite place for large bass. They are very shy; and it is exasperating to see a half dozen of them moving about in a little school, mocking you with near presence, and your own inability to catch them. Their favorite bait is small catfish, which can be easily purchased.

About fifteen hundred feet above those rocks (Jersey side) is the mouth of a little burn or rivulet that is full of fresh-water shrimp, a favorite food of the bass which lurk there for the shrimp that venture out into the river. The water is not over four feet deep along there; but the current quickly extends the line to a hundred feet below the anchored boat; and patience and persistence should be rewarded with the landing of a fish or two. Further up a half mile, say sixty rods below the upper part of the island, there is a central channel of water about eight or nine feet deep, extending up and down the river about eight hundred feet. It is not easily found, but is there. In that channel I lost the largest bass that I ever had on the outer end of a line. It furnishes the best bass fishing near the Gap.

But to the real angler—one who loves river and bass fishing, and who is not to be allured by the good trout fishing not far away, the best thing to do is to have a boat taken by wagon to Shoemaker's Eddy, several miles above, and come down in the boat, fishing slowly, anchoring frequently, and consuming a whole day in running about four or five miles. Such a trip should yield several fine bass for two rods. Catches of a dozen or more are frequent.

Sometimes the deep water right in the Gap gives up good bass to the angler; it is almost constantly fished in summer, for the Gap is a favorite and very beautiful summer resort, with about twenty hotels and boarding houses.

It is no advertisement to say here that the Gap is best reached by the Lackawanna road, and that to the stranger the O'Brien boys will perhaps be found the best boat renters and guides. The Benekill should be entered from the lower end of the island—there is a shoal stretch of water at the upper end where boats strand on the myriad of small rocks, and anglers who enter the Benekill there would probably have to wade, or even drag the boat.

These are scenic and angling joys that can be easily reached. The sportsman can leave New York as late as four in the afternoon, and enjoy a moonlight row on the river at the Gap. He will find fifty places where he can be comfortably housed, some of them being first-class modern hotels. Of course to one who insists upon camping, their presence at the Gap is an objection; but the place is singularly wild and picturesque; and in spite of the almost perpetual angling, a few fish can nearly always be taken anywhere between the upper bridge and the rift just below the actual emergence of the river from between Mts. Minsi and Tammany, into the broad, fine, agricultural country below. Such a chance for sport must be honorably mentioned, for most anglers make fishing an incident as they visit their families which have fled from the heat of towns. There are enormous bass, very many of them, right at the Gap, in that stretch of the river which is visible in the picture. To actually hook and land them is another matter, for they are pursued for many months yearly. This angling water cannot furnish more than a shadow of such fishing as can be found in Ontario, Quebec, Maine, Wisconsin or Minnesota lakes. But it is so cheaply accessible, the accommodations are so sure to be good, and the scenery is so magnificent, that it is specially worthy of mention to the readers of *FOREST AND STREAM*.

L. F. BROWN.

Fish and Fishing.

Salmon Fishing Has Been Very Poor.

THE salmon fishing season on Canadian rivers has been very poor up to the middle of last week. Those who were on the south shore streams fairly early found a few fish in the pools, and had fair sport for two or three days, but as the fish which were in the pools on their arrival moved higher up the rivers, no others seemed to arrive to take their place. In the higher pools, too, very few fish were to be found. The season was so backward that some of the guardians think the fish may have en-

LOOKING UP THE DELAWARE FROM MT. MINSL

tered the rivers and found so much ice that they went out again and have not yet returned. The water continued so low that after the arrival of anglers on the rivers no new fish seemed to enter them until a few days ago. Now word has been received from some of the rivers that recent rains have had a beneficial effect and that more fish are entering them. But, in the meantime, several fishermen who had but a limited time to spare for fishing, have returned from the rivers with the worst sport they have had for years. Those who are fortunate enough to be able to remain behind are just beginning to enjoy fully fine fishing. From the Ste. Marguerite and the other tributaries of the Saguenay in particular come very good reports from the fishing camps.

The many salmon fishermen interested in these rivers will be delighted to hear that Fishery Guardian J. N. Maher has recently succeeded in catching no less than eight of the Saguenay River poachers, red-handed. They were netting salmon when found, and the guardian seized ten nets and four wooden canoes belonging to them. The poachers are now being prosecuted before a local magistrate. These poachers have been for years the bane of the salmon fisheries in the Saguenay district, and these arrests will doubtless have a very salutary effect.

The salmon fishing in the north shore rivers was very poor indeed up to last week, scarcely any fish having entered the rivers on account of the backwardness of the season. Here, too, the later fishermen are sure to have the finest sport.

Another fatality has unfortunately to be added to the long list of those attributable to the angling in the salmon rivers on the coast of Labrador and the north shore of the Gulf of St. Lawrence. A boat containing a party of fishermen on the Romaine, which, as recently reported in this column, was lately leased by the Government to Sir Charles Ross, was upset and a young man named Plumb, eighteen years of age, was drowned. He was with his stepfather, Judge Nesbitt, of the Supreme Court of Canada, and Sir Charles Ross, at the time of the accident. Deceased was a most promising youth and a cadet at the Royal Military College of Canada.

Mr. C. B. Barnes, of Boston, and his friend, Mr. Jones, were among the early arrivals on the Cascapedia, and for the first few days of their stay had very good sport, but even upon the royal Cascapedia there have been many poor days this summer, and later fishermen are likely to have much better sport. Mr. Barnes killed sixteen fish and Mr. Jones seven. The former mentioned gentleman had the misfortune to lose an enormous fish, which he had played for over an hour, and which finally escaped by taking the line into the driftwood or a snag in the course of a run which it was impossible to control. It is thought by those who saw the fish and its fight that it must have been a record one, even for this river of fifty-pound salmon. The Governor-General of Canada, Lord Minto, is at present at Camp Duren on this river, but at present writing it is understood that not very much luck has gone his way. Messrs. Kennedy, Douglas, and Davis are among the American anglers at present in camp on the Cascapedia.

Senator Forget and party are fishing the Bonaventure. Mr. R. E. Plumb is on the Natashquan and Mr. Ivers Adams, of Boston, and party are fishing the Moisie. The Chamberlain Shoals party on the Restigouche, consisting of Dr. F. W. Campbell, I. H. Stearns, W. M. Macpherson and others, have had the usual luck of the season, killing some good fish during the first days of the fishing, and then having several blank days. Some of the party have returned home and will go back to the river later. The fishing in the Restigouche in the early part of the season was largely affected by the illegal action of the netters at the mouth. Several nets were ordered up and some were seized by the Government-cruiser, but the fishing has not improved very much as yet.

The ouananiche fishing, on the other hand, is surprisingly good, notwithstanding that the water is still a little high. The best of the sport will doubtless be had this year in July. The fish are running large, and the killing of doubles is considered so risky by the guides on account of the size of the fish that they are generally urging the fishermen to use but one fly, a piece of advice which, it is scarcely necessary to add, has not much weight with anglers who are well supplied with tackle and enjoy the kind of sport in which there are some good chances on the side of the fish.

Most of the fishing club men who have been trouting along the line of the Quebec and Lake St. John Railway have returned home, well satisfied with the result of their trips, but Lake Edward and other open waters have still many visitors on their banks.

Importance of the Canadian Fisheries.

THE newly published Year Book of Canada for 1902, just issued by the Dominion Government, contains some valuable information concerning the commercial fisheries of Canada. It may surprise some people to learn that the total value of last year's yield of the marine and fresh water fisheries of Canada was \$25,737,153, or \$4,179,514 more than that of the preceding year. No fewer than 78,290 fishermen were engaged during the year, exclusive of 15,135 men who found employment in lobster canneries, while the salmon canning industry of British Columbia gave employment to 18,942 persons. The value of vessels, boats, nets, piers, etc., connected with the fisheries of the Dominion is placed at \$11,491,300. The number of fry distributed from the Government hatcheries last year was larger than that of any previous year, the total, outside of 120,000,000 young lobsters, having been 151,401,000.

Mr. Carnegie's Hatcheries.

Speaking of fish hatcheries reminds me that Mr. Carnegie is devoting a good deal of time and attention to the same subject on his Skibo estate. Many sportsmen, as well as most of the intimate friends of the master of this estate, are aware of the fact that while Mr. Carnegie never handles a gun, he is an ardent angler, and will linger patiently for hours beside a moorland stream. The scarcity of salmon, both in sea and stream, however, has been very marked within recent years in the neighborhood of Skibo, and with the view of improving the angling on his estate, Mr. Carnegie has constructed both salmon and trout hatcheries on an elaborate and extensive scale. The sites of the tanks on the banks of the River Evelix have been personally selected by Mr. and Mrs. Carnegie,

and the aid of almost every expert in Scotland has been solicited in order to render the scheme successful.

The Supply of Salmon.

There would be some hope for the future of the remaining American, Canadian and Newfoundland salmon rivers if those who are interested in the commercial fisheries of these countries could be induced to take the same intelligent interest in the preservation of the supply of fish in the waters where they set their nets as is manifested by the corresponding classes in Great Britain. Judging by the loud complaints in the newspapers, the Government of Great Britain is no more to be depended upon for enforcing the laws enacted for the preservation of fish than are those on this side of the Atlantic. It is true that there have been recent Royal Commissions upon both the Irish salmon fisheries and upon those of the Tweed. Their reports were made some time ago, but no Government action followed them. Recognizing the fact that it was obviously unwise to hope for any substantial and immediate legislative reform unless influential pressure could be brought to bear, the Fishmongers' Company have taken a step which entitles them to the gratitude of all who are interested in the salmon fisheries, whether as a means of profit or for sport, and it ought to be unnecessary to add that the interests of the nets and the rods are practically identical. If there are no fish in the upper waters to provide sport for anglers, it is certain that the yield of the nets will fall off. At a recent meeting convoked at the instance of the Fishmongers' Company, a salmon and trout association for the United Kingdom was formed. At the head of the list of members, already fairly long, occur the names of the Duke of Abercorn, the Duke of Bedford, the Earl of Denbigh, Sir Herbert Maxwell, and other distinguished persons, while among others of the membership, notable for their special technical knowledge of the subject, are Messrs. Willis Bund, author of "Salmon Problems," A. D. Berrington, W. H. Grenfell, Henry Fennell, Dr. Noel Paton, and others. The objects of the new association are to improve the salmon and trout fisheries of the United Kingdom, and to render operative such recommendations of recent Royal Commissions as may be deemed advisable. Sub-committees will be appointed to deal with the various aspects of salmon and trout fisheries, both as commercial industries and from the sporting standpoint, and attention will be directed to the important questions of river pollution, water supply and fishculture.

It is quite impossible to point out how very much room there is for a somewhat similar organization on this side of the water. Those interested solely in the commercial fisheries of this country and of the United States are singularly blind, as a general rule, to the fact that their interests are identical with those of the angler, their chief endeavor being to prevent the parent fish, as far as possible, from ascending the river to spawn, in order that they may swell the yield of their nets. It is simply another case of killing the goose which lays the golden egg. There is over netting at the mouths of nearly all the Canadian salmon rivers, and I was only told last week by one American angler that he had been compelled to give up his lease of a river because he found that his efforts to stock it were neutralized by the netting at its mouth.

E. T. D. CHAMBERS.

The Adirondack Fish Mortality.

Editor Forest and Stream:

One of the lamentable results of the extensive forest fires in the Adirondack region this year, notably in Franklin and Essex counties, was the destruction of an enormous number of speckled trout. Just what caused the death of so many fish is not definitely known, but it seems absolutely certain that the mortality was in some way occasioned by the wilderness conflagrations. Various theories have been advanced in regard to the actual and immediate agency which brought such wholesale slaughter, but none of them appear to be entirely satisfactory. Reports received from Elizabethtown and Lake Placid were to the effect that quantities of dead trout had been found along streams that pass through the regions burned over, the fires evidently having warmed the water sufficiently to kill the fish. Another statement was that several hundred pounds of trout had been picked up along the Upper Boquet River, as a result of the serious forest fires in that section, one of the explanations volunteered being that the water in the river became so hot that the fish were unable to survive. It seems quite possible that the water in a small brook, flowing at a moderate rate for some distance through a portion of the wilderness where fires were raging fiercely, might be heated sufficiently so that the trout it contained would be killed. On the other hand, it appears almost absurd to argue that the water in a large stream having any considerable depth, could be warmed up by the fires to such an extent as to cause the death of its finny inhabitants. As the Boquet River and some of the other streams in which dead trout were found have quite a respectable volume of water, people of an inquiring turn of mind are trying to think out some other possible reason for the death of the fish.

The story comes from New Hampshire that dead fish were observed in the streams of that State during the late wilderness conflagrations, and a New Hampshire authority takes the ground that they were killed by potash or alkali leached from the forest fire ashes into the brooks by the heavy rains. On the face of it, such an explanation looks quite reasonable, and possibly there is some truth in it, but it will not apply to the Adirondack region, for the trout which were found dead there perished during the drought and the fires, prior to the time when the rains set in.

It is said that one of the results from the recent burning of the Malone paper mill was that all fish in Salmon River below the mill for ten miles were killed by the acid from the sulphite mill being precipitated into the stream. That great destruction of fish life might be occasioned in some such way as this can easily be credited, but so far as can be learned, no one has yet advanced the theory that the trout in the Adirondack streams first mentioned may have died from poisoning. In the absence, however, of any explanation which is wholly satisfactory as to the manner in which the trout in Boquet River and a num-

ber of other streams met their fate, is it not worth while for someone to look into the subject carefully and ascertain whether or not it is possible they were poisoned by wood acid, wood alcohol, the creosote in wood tar, or some other product from the burned trees? Pyroligneous acid, or wood vinegar, a crude commercial form of acetic acid, is made by the destructive distillation of wood, and who can say that when the fires were raging fiercest they did not sometimes produce from the green wood consumed a liquid substance of a somewhat similar nature, which, finding its way into the streams, caused the death of the trout by poisoning? Of course, in destructive or dry distillation, a closed vessel or receptacle is required, and this important feature in the process of manufacturing wood acid was lacking in the forest fires, but that there were juices constantly exuding from the green wood under the influence of the great heat cannot be doubted, and the question is, Were these of a poisonous nature? It seems quite possible that some of the liquid products of the burning wood may have possessed properties which rendered them destructive to fish life.

This idea is simply thrown out as a suggestion, but it appears to merit the thoughtful consideration of those who are investigating the subject. Perhaps if all the conditions were known the heat theory would appear more plausible, but under the circumstances the possibility that the fish were poisoned seems to be strong enough to warrant attention. It is hoped that the State authorities will look into the matter carefully, and eventually be able to furnish the public with positive information concerning the cause of the great mortality among the Adirondack trout.

UTICA, N. Y., June 27.

W. E. WOLCOTT.

In Western Massachusetts.

SPRINGFIELD, Mass., June.—The best of our trout season is now behind us here in western Massachusetts, and only the most enthusiastic anglers have done much fishing. No rain fell during the month of May, and this made the brooks so low that the trout went into the deep pools in the woods, where it was impossible to cast a fly over them. No one can remember a more disappointing season, for it opened well and every one was waiting for the time when the apple trees broke into a cloud of pink and white bloom, for it is then that our season is at its height. But the brooks began to fall before the flowers came, and not until after June 1 did we have any rain, and even now the brooks are not getting much of the water, as the parched fields and woods claim it all. Down here on the southern border of the State our anglers can take advantage of the Connecticut law and fish there from April 1 to 15, on which latter date our season now opens and remains open until July 15, while the Connecticut season closes July 1, and then we will have our friends from over the border with us and return a few favors. This law of ours is a sore subject, as it was put through the Legislature while our anglers were dreaming of past trips to the brook and lake sides, and as a result of the nap, the season in our four western counties—Hampden, Hampshire, Berkshire and Franklin—were shortened two months, while the anglers in the eastern part of the State can fish from April 1 to Sept. 1, as of yore. Some of our leading anglers, headed by James Brigham, got up a petition asking the Legislature to give us back our old season here in Hampden county, but the people up in Berkshire defeated us. Next season the fight will be made again, and the season should be changed, as the fifteen days which were taken off from the first of the open time, are apt to give us our best sport, and there is always good fishing in the meadows on an August evening. Our fish do not run for the spawning beds until after October 1, and as most of our good brooks are controlled by clubs, it is hard to see why we should be protected from ourselves when we have to rent or buy our water, and the State will not give us fish or fingerlings to stock our brooks.

The March weather was beautiful, the days warm and clear, and the nights not too cold. This could have but one result. It made people crazy to fish, and many a trout was stolen before the season opened. April 1 came at last, cold and drear, but everyone who had friends on the other side of the State line went bounding down there and great was their reward. The brooks, which run into the Scantic River, are always good early in the season; Kettle Brook, at Windsor Locks, yielded up some big ones, and many of those in Stafford contributed big trout. Even the oldest angler was surprised at the size of the fish, for they were large and in perfect condition. The strange part of the day was that the fish took a fly freely, and jungle cocks and alder flies seemed to be the most killing. It was a cold day, but our local woman ventured out and landed one trout weighing 17 ounces, an unusually large one for this section of the country. Our own season opened more inauspiciously, and a stinging sleet and rain cut the hands of the ardent ones on the first two days, and the half frozen fish swallowed the worms and then lay on the bottom like suckers. Fly-fishing was out of the question, and it was very tame sport. A week or so later the fishing improved, and the bigger fish began to take interest in royal-coachman and cowdungs, but the hackles did not kill for another week for some strange reason, for they have always been one of the most killing flies on our brooks; especially a small brown hackle with a red and gold body. It is not a nice thing to record, but most of our anglers use worms in fishing our brooks. Fly-fishing has not the hold here that it should have, and the reason is hard to understand, as both the North and South Branch clubs—our two largest and best trout clubs—control beautiful stretches of meadow fishing where the fly-fishing is of the best, and excellent sport can be enjoyed with a 4-ounce rod if it is properly handled.

The fishing on both the North and South branches was good during the early part of the season, but during May was poor, as the brooks were both too low. None of the members of either club ever try to catch big creels, as they do not want to deplete their waters, and put back all small fish, but some fine baskets of 20 or 25 fish have been taken during the early

morning hours on both brooks. During last week (that of June 7), some good catches were recorded on both brooks, as the rains livened up the fish and they began to rise in the meadows again. The bad May fishing drove many of our anglers to Maine, and from both Rangeley and Moosehead come reports of fine fishing. Warner Sturtevant, James Brigham, Robert Wallace and others have been at Rangeley, and Walter H. Wesson, of the Smith & Wesson Pistol Co., was at his camp at Moosehead, with a party of local men. The latter report some good fly-fishing for small trout, which rose well to Zulus, silver-doctors and Montreals.

In the Berkshire Hills the fishing season has been more even, and especially at Becket some good catches have been made. Alfred Birnie and Charles L. Goodhue control some good fishing in Becket, and they and their friends had excellent sport in May. The Blandford and Otis fishing has not been as good as usual, and the bass fishing in Ashley ponds has not begun yet. Some of the Northampton and Greenfield fishermen had good sport early in the season, and A. L. Powers, M. O. Carey and Edward Sisco, of the former city, caught some fine baskets in April. Westfield is always a busy little town for anglers, and the question of stocking Hampton ponds with pike, perch and perhaps rainbow trout has been discussed by the Westfield anglers' club, a flourishing organization. The Amherst anglers had some fishing which they will remember, during the early part of the season, but a Springfield boy, Bradford Adams, caught one of their largest trout, weighing well over a pound, and so took away one chance to boast from them.

All of our anglers who enjoy the fall shooting have been pleased to hear so many quail whistling in the fields this spring. The snow was so heavy early last winter and came in such a rapid series of storms, that it was feared that most of the quail had been either starved or frozen to death. This was greatly mourned, as a few years ago the quail became nearly extinct under like circumstances, and much money was spent by some of our leading sportsmen in buying western quail to liberate and restock our covers. This was done successfully, and during the past two seasons the quail shooting was better than it had been for years. Many birds have been seen this spring, however, and while it is yet too early to see the chicks scurrying across the country roads, there is every promise that there will be large numbers of them. The partridge also weathered the winter well, and, although they are not near as plentiful as they were five years ago, one or two broods have been reported, and a number of old birds have been flushed by anglers fishing through the woods. Many English pheasants have been seen this spring, and in a few years they should furnish some good shooting, as they breed well near the city, and a large number are killed each year by the authorities in Forest Park, where the birds are raised by the city, and by Mr. Dickinson, who has a large pheasantry and who is stocking the woods near his home. The shooting of these birds is prohibited now, but a number of them were put up in the stubbles last fall and sorely tempted some of our crack shots.

The deer are rapidly increasing in western Massachusetts, and especially in the Berkshire and Wilbraham Hills. It is not an uncommon sight for farmers on the hillsides to see the animals in the pastures with their cows, and one sometimes sees a doe dashing through a wood road while driving. The Legislature passed a bill this spring giving further protection to the deer by extending the closed season for several years, although there was some opposition offered by the farmers, who claimed that the deer were so plentiful and so tame that they were causing much damage to crops. There is a strong feeling in some sections of the State against an open season on deer, for people realize that the country side is so thickly settled that rifle shooting would surely entail loss of human life, but it is improbable that the deer will ever be here again in such numbers as to do serious damage. Some few are killed by the lawless element each fall, and others are wounded by fox hunters in the winter and slink away to die unseen. Two dead does have been found recently, one by Geo. R. Turner and Robert Cooley, of this city, while on a fishing trip to Russell, and another by Westfield anglers in their own town. Both deer had been dead so long that it was impossible to ascertain the cause of death. CLICK.

The Barracuda in Hawaii.

CALIFORNIA's famous fish, the barracuda, has appeared in this market for the first time. It ought, with the good offices of the Fish Commission, to also appear in these waters, where there seems to be a chance to acclimate it. Indeed, a first cousin to the barracuda, one of the group which includes the fresh-water pickerel and muscalonge, is already found along shore and in ponds connected with the sea. Like the others, it is a carnivorous fish, lying in shady or sedgy places, motionless and alert, to dart upon any smaller fish that swims unwittingly near. Its flesh is delicate and full of flavor, and natives are so fond of it that they have been known to buy at thirty cents a pound.

The Hawaiian specimen is small, but the barracuda, which bears a relation to it like that of the muscalonge to the pickerel, ranges in weight from six to ten pounds. It would be an invaluable gain to the food resources of this group and a delight to sportsmen, for it takes the trolling hook behind a fast yacht with all the gameness that a fish needs to show to make itself popular with anglers.

Meanwhile, if the barracuda cannot be caught it can be bought, which is the next best thing. The importance of fish as a substitute for meat in the tropics makes every addition to the edible fish supply a thing of gastronomic and physiological importance.—Hawaiian Gazette.

"I read somewhere the other day," said Mr. Henpeck, "that one of the big mercantile corporations pays a certain man \$1,000 for each idea he furnishes. George! I'd like to have a chance of that kind."

"Wretch!" exclaimed Mrs. Henpeck, "do you want your innocent wife and children to starve?"—Chicago Record-Herald.

Maine Waters.

BANGOR, Me., June 20.—*Editor Forest and Stream:* At the Bangor salmon pool the fishing has been slightly improved over the preceding weeks, but even now it is nothing to boast of. Several fish have been landed during the week, Wm. Munro, J. H. Peavey and Howard Peavey being among the successful anglers, Mr. Peavey leading the list with a 20-pound beauty. It was reported that unscrupulous persons were securing salmon with a gaff from certain favorable locations not accessible to those not in the secret, and a warden has been appointed to keep an eye out for infractions of the law in this respect. As the fishing, what there has been, has all been since the appointment of this warden, his watchfulness may have had something to do with the larger catch.

At Huston Pond camps there have been several successful parties recently, none more pleased with results than Oliver W. Shedd and Orin A. Barnard, of Boston, who visited West Chairback Pond during their visit and took, on the fly, twenty-one beauties weighing from $\frac{3}{4}$ pound to $1\frac{1}{2}$ pounds, dressed. Other successful visitors at this resort included J. L. Bailey and wife, Walter Bailey, Charles Fisher and wife and Roy Fisher, all of Henderson, who caught togue in Big Houston weighing as heavy as five pounds, and trout in West Chairback weighing from a pound to $1\frac{1}{2}$ pounds; E. F. Dearborn and E. H. Whitten, of Waterville, who secured some nice strings from Little Houston and West Chairback; A. D. Jones, of Bangor, who took a fine string of eighteen from Little Houston, one a $1\frac{3}{4}$ -pound trout.

Dr. Chalmers, P. W. Linscott and Charles Wright, of Woburn, Mass., and Charles Goodrich, of Lynn, Mass., had a delightful trip to Bay View, on the shore of Dobs Lake, securing all the fish they cared for. Hon. Henry W. Mayo, of Hampden, and friend Frost, of Bangor, were there for a few days and had a most enjoyable trip, besides landing some fine salmon. Their guide paddled them to within a few rods of a large bull moose that was crossing the lake at the Narrows, but they didn't go very near, preferring to view his majesty from a safe distance. Moose are reported far more numerous in the easterly part of Washington county than they have been for many years, and as the reports are largely from sportsmen rather than those who might be financially interested in the appearance of big game in their vicinity, the impression is that the game is actually increasing in those localities mentioned.

Carry Ponds in the Bingham, or perhaps it would be better to say the Upper Kennebec region, have proved fully as popular this year as in past seasons, and more so, if anything. Over 100 anglers have visited those ponds and stayed for a visit lasting from a day to a month since the season opened, and that they have had success goes without saying to those familiar with the possibilities of those waters. The supply of trout of average size seems absolutely limitless in the ponds in that vicinity, and anglers are sure of good results there, even if they do not get any eight and ten-pound square-tails for record fish. W. H. H. Ward and wife, of Amherst, Mass., with R. H. Goodell, of Boston, are there for the summer, and have made some great catches already. In the last two weeks Mr. Ward, who, as a true sportsman, disdains the use of all but the fly, has landed 500 trout, the most of which have been at once returned to the water unhurt. W. H. Miller and wife were in camp there for two weeks, during which time Mr. Miller made two trips to West Carry, taking a handsome string of togue and trout each time, the fish running as heavy as $3\frac{1}{2}$ pounds apiece. Among others who have been enjoying great sport with the fly are Dr. E. L. Styles, of New York city; J. P. Carpenter, of Boston, and John F. Hutchinson and wife, of Lexington, Mass., who have been enjoying the best fly-fishing in their experience.

The season at Grand Lake Stream is proving all that it promised, and the number of guests there has been large since the fly-fishing opened on the stream, although many are still enjoying trolling on the big lake. Among those who have registered there this month are the following: Wilnot H. Smith, James D. Smith, Dr. G. E. Curtis, Geo. H. Betts, DeWitt Bailey, of New York city; J. V. Hemstreet, Herkimer, N. Y.; Geo. Beals, Geo. L. and Fred S. Hunter, Geo. A. Fernald, J. S. P. Alcott, of Boston; C. L. Beals, Winchendon, Mass.; E. H. Mather, Portland; Henry F. Adams, of Pawtucket, and others. The fly-fishing has been splendid, and from present appearances will continue to be good until the middle of July. W. H. Smith, of New York, who has been there twenty days, has caught in all about 150 salmon, while J. D. Smith, having been on the lakes only six days, has an average of eight salmon per day. Henry F. Adams, of Pawtucket, has averaged ten fish per day, mostly salmon and a few trout, one of the latter weighing $2\frac{1}{2}$ pounds. The Hunter party stayed but seven days, but they landed 120 salmon and 29 trout, while of the string taken by Mr. Alcott during his eight days' visit, 60 were salmon. It seems to make no difference whether, at this writing, one is fishing with bait or flies on the lake, or with flies on the stream, results are equally satisfactory. One party of two who tired of fishing in the lake and stream—as many do at this season when results are so plenty—made a trip to Gardiner Brook and evidently tried to clean it out, for they took 230 trout—but there are still some trout left, for a later visitor captured 23 in an afternoon.

Speaking of moose reminds the writer of an experience which the passengers on the trolleys running into this city from Oldtown had a few days since. It was in the early morning, and the car had just reached a point above Mt. Hope cemetery, some two miles from the postoffice, when the motorman was obliged to stop the car while a big bull moose crossed the track and, after all had a fine opportunity to observe him, disappeared in the direction of the river. It may have been the smoke of the fires drove the big fellow from the woods, but as they were mostly out at the time, it may have been one of those cases that have occurred in this city several times within a year or two, caused by the increasing numbers of moose and their apparent fearlessness during the close season.

Capt. F. D. Bigney, of the steamer Comet, one of the steamers of the Coburn Steamboat Company plying between Greenville and Kineo, has had his run changed from the head of the lake, so that now he covers but half the distance in direct run that he formerly did. Capt.

Bigney is an exceedingly modest man, but it is suspected by those who know how anxious sportsmen are to kill bears, that Landlord Colbath of the Seboomook House had him transferred to the Kineo run so that there might be some bears left to hunt up there when open season rolls around. It seems that the Captain, having time on his hands between trips, set a bear trap a few miles from the head of the lake, and in just a few weeks caught two bears, one big bear and the other a small cub, the latter of which he is having mounted whole. One day as he was over looking after his traps (having caught the larger bear previously) he heard a slight noise, and looking up saw on a log within almost reach of a quick jump two bear cubs that had not, for some reason, discovered him. A movement in another direction called his attention that way, and there, standing up and looking at him in astonishment, was a third bear, and he heard still a fourth in the bushes. He is positive about the bear he didn't see, as he discovered later enormous tracks, too large for any of his visitors, which had carefully investigated his dangerous plaything and decided not to interfere with it. Of course, careful man that he is, the Captain visited and removed his traps when he was ordered from Seboomook to Kineo, that no animal might be caught and kept there in suffering.

John Towne, of Portland, and B. B. Talbot, of New York city, paid Schoodic a brief visit the other day, taking three splendid lake trout in the lake and good strings of trout in nearby brooks.

Mooshead continues to report good catches, although the sport is confined almost exclusively to the fly. Dr. J. C. French and wife, of Webster, South Dakota, has been at Northeast Carry staying a week, and their largest square-tail being a 4-pounder. One morning before ten o'clock the Doctor made a fine catch of six square-tail trout, a laker and a whitefish.

The gates in the dam at the Outlet have all been closed, and the fishing has been exceptionally good all the week. Monday 200 trout were taken at the dam, averaging a pound and a half. A. J. Bigelow, of Worcester, took four 3-pound trout on the fly Wednesday, and L. B. Jewell, of Hartford, Conn., took two before breakfast. A. H. Stevens, of Marlboro, Mass., who was there only four days, returned home the middle of the week with his full limit. Miss Elizabeth Wilson is also among the happy anglers, having landed a four-pound trout on the fly this week, as well as a two-pound togue. Among others who are enjoying the sport at the Outlet are F. W. Jones and wife, of New York city; A. H. Davis and wife of Portland; C. H. Baker, of Boston, and W. H. Place, of Providence, R. I.

At Deer Island, Clement C. Moore, of New York, seems still able to lead all the fly-fishermen, and the man must be an expert, indeed, who can surpass this veteran of the rod and reel, who has a four-pound trout for his best, and a long list of two to three pounders. S. P. Chick and wife, of Brookline, Mass., had fine sport at the same place, taking thirty-nine lakers and nine trout during their stay. D. H. Spear and wife, of Bath, have had great sport in that vicinity, and the latter counts herself among the successful anglers with her record of a $3\frac{1}{2}$ -pound trout.

Near the Crow's Nest in Sandy Bay the other day, Roy McAlpine, of Greenville, hooked and landed a handsome trout, which, when weighed, was just $4\frac{1}{2}$ pounds, and measured 22 inches in length. It was a beauty, and one of the best taken in Sandy Bay this season.

HERBERT W. ROWE.

CHICAGO AND THE WEST.

Swimming Powers of a Horse.

CHICAGO, Ill., June 20.—My friend, Mr. W. A. Powell, propounds a conundrum as to the swimming powers of a horse, bringing up the question whether or not a horse can swim and carry a man on its back. He says: "When I was in Mississippi I had something sprung on me in regard to which FOREST AND STREAM ought to be able to give me some help. A gentleman started it at the Bobo place, bringing up the argument whether or not a horse could swim with a man on its back. He said that no horse, or at least none that he had ever seen, could swim with a rider on his back, and that he had seen it tried on a wager at Meridian, Mississippi, fourteen different horses from livery stables being tried, and not one of them being able to keep his head above water, although when the rider got off the horse swam all right. He also said that any man who had a horse that could swim and carry a rider could make a big pot of money by making a trip to Meridian. I was not well enough posted to go into the argument very far, but I have surely been on a horse when I thought he was swimming with me, although I am willing to admit there may be two sides to the question." Later Mr. Powell wrote again regarding this interesting question: "I have been getting more information in regard to the swimming power of a horse, and I am going to take a horse to Mississippi one of these days and break that town of Meridian, where they say a horse can't swim with a rider."

I think Mr. Powell will be able to break the town all right, if they are willing to back their judgment as above enunciated. I presume a great many men have been in swimming depth of water on horseback and have noticed that if they sit low and well back the horse can get along. Of course, it is much better to slip off of the horse, take the down stream side of him and hold on to the saddle horn or to his mane. Indians sometimes hold on to the tail of the swimming horse. Of course, the more of the man's body there is submerged, the easier it will be for the horse to swim. It is not a proper, but a possible, thing for a swimming horse to carry a man who may fairly be said to be upon its back.

Tarpon.

Mr. Oswald Von Lengerke recently returned from his tarpon trip at Aransas Pass, and reports a very good time. He beached three tarpon and played a great many fish which he purposely turned loose, and this was the experience also of Mr. C. H. Lester, of this city, and Mr. Delos Thompson, of Rensselaer, Indiana, who made up the party. Mr. Von Lengerke showed a badly disfigured thumb and said that any tenderfoot who begins tarpon

fishing is liable to get into trouble. He left his friends practically out of the game, Mr. Thompson having a thumb which seems to be broken or dislocated and which became so badly swollen that he could not do any fishing. Mr. Lester lost a thumb nail, and all of them appear to have had a good deal of difficulty with the reel handle. Mr. Von Lengerke says that the sport is very keen, but has a good many features of hard work connected with it. Sometimes a tarpon heads seaward instead of running up into the Pass, as was the case with Mr. Lester's fish, and when the boat is once taken out into the Gulf the sport is almost too rough for comfort. There seemed to be no diminution of the tarpon supply in this famous district. The fishing is done both by trolling and still fishing, the latter being perhaps sometimes close along the jetties, in case of high wind from the Gulf.

Wrinkles.

My friend, Mr. B. K. Miller, Jr., of Milwaukee, writes: "I have run across two new ideas connected with trout fishing; at least they are new to me. First, to clean fish without a knife and without opening the fish: loosen the gills and then pull out the entire internal organs carefully. Result, fish clean and not mutilated. Second, instead of attaching an eyed fly to the leader, in the usual way, with a jam knot, turtle hitch or other knot, hang the fly loosely on a loop made at the end of the leader. I have not tried this thoroughly, but the fly bobs around most alluringly."

The method of cleaning trout which Mr. Miller mentions is practiced to some extent in the Lake Superior country. It leaves the fish less disfigured, and from all I can learn in quite as good shape for keeping as when the body is opened in the usual way. As to Mr. Miller's scheme of putting on an eyed fly, I don't believe he will find it so successful as one which leaves the fly attached to the snell or leader more rigidly. This alluring bobbing around is what some of the tackle sharps wish to guard against, as it allows the fly to get its barb up over the leader and otherwise to mix things. I remember to have seen some very learned discussions on these matters in the English angling papers, and the consensus of opinion there seemed to be that an attachment which left a sort of loose joint at the bend of the hook was not so desirable as one similar to the usual eyeless hook as mounted on gut.

New Trout Tip.

I met my friend, H. Wood, to-day, and he is recently back from a certain exploration in the northern country. He says that at Seney, a little deserted lumber village seventy miles east of Marquette, on the Duluth, South Shore and Atlantic, he heard of a stream which seems to be very little fished and which ought to be a very good fly-fishing river. This is the Little Fox, a stream of which, I confess, I never heard before. He says that his informant at Seney told him that he and two friends caught 300 trout on the Little Fox on their last trip. They were worm fishermen, but the informant said that the Little Fox would be a good one for fly-fishing, and that it could be waded with fair comfort. The trout ran up to 1½ pounds. If they will come anywhere near a half pound, and if the stream can be waded, and if one can cast a fly there with any sort of comfort, this water is very much worth watching. It is twelve miles out from Seney, over a fair road, but one has to camp out on the stream.

Dope Would Not Work.

Our revered angling friend and companion, Colonel Bill Haskell, got into trouble the last time he was out fishing with Mayor Harrison and other distinguished gentlemen of this city. It seems that Colonel Bill had a friend who customarily carries his fly dope in a collapsible tube, similar to one in which gun grease is vended. By mistake Colonel Haskell got hold of a tube of gun grease instead of fly dope. He did not discover his mistake, but did discover that, in the words of the journalist, he was the cynosure of every eye in the mosquito contingent.

Amateur Fly-Tying.

Mr. Jephtha G. Dunlap, of San Jose, California, wants to know about the McGinty and Bucktail flies, as mentioned in these columns. The easiest way will probably be to send him samples of these patterns. Mr. Dunlap is good enough to send me a couple of flies of his own making, both very prettily done. One he calls the Garrard, after a friend of his. The dressing of the latter fly is as follows: Body scarlet worsted, tipped and wound with silver tinsel; tail, two narrow sections consisting of three or four barbs from the soft black white-tipped wing feather of the widgeon; hackle, light blue, the same as that of the silver-doctor; wing, breast feather of California valley quail. Mr. Dunlap sends me a few of these breast feathers of the California quail, which he thinks might be serviceable with some of our freaky Eastern trout. I will take pleasure in trying the flies, although they seem a bit bright for most of our fishing here. I have usually found the brighter flies to do best in wilder streams, where the trout are not fished so hard, and where they were native and not planted.

HARTFORD BUILDING, Chicago, Ill.

E. HOUGH.

Canadian Salmon Fishing.

MR. DAVID T. ABERCROMBIE has just returned from a month's fishing and camping trip at the Piscicultural Association's preserves near Bic, Quebec.

Mr. Abercrombie was in camp during the season of forest fires, and much anxiety was felt by their party; for two full weeks they didn't see the sun. The salmon fishing was very poor owing to low water; trout, however, were plentiful, and good fishing was had.

It was Mr. Abercrombie's intention to visit Labrador, but a storm caught them and they lay at La Havre, N. S., one week, and then returned. At this point several grilse were taken weighing 9½ to 10½ pounds on the average.

The salmon fishing has been universally poor. The low water at the times when the fish should go up stream for the spawning season, kept them back. Mr. Abercrombie reports taking just three salmon.

Trout Fishing at Canadensis.

Editor Forest and Stream:

On my recent visit to the mountains of Pennsylvania, I met Mr. Wesley Price, of the Spruce Cabin Inn. It was his intention to wire FOREST AND STREAM that day that the trout fishing with them was good. The streams are about normal, and some good catches are being made. The Broadhead, famous for big ones, is yielding up a goodly number of big trout; most of this stream can be fished with flies. T. E. B.

The Kennel.

Fixtures.

Oct. 6-9.—Danbury, Conn., Agricultural Society's show.
Nov. 3-6.—New York.—Annual show of Ladies' Kennel Association of America.
Nov. 9.—Fourteenth annual beagle trials of the National Beagle Club of America. Charles R. Stevenson, Sec'y.

Bloodhounds and Man-Hunting.

Editor Forest and Stream:

I note the inquiry of your correspondent, Henry De Varigny, in regard to bloodhounds and man-hunting, and the replies of Marshall Bond, Coahoma, and others, which give some interesting information respecting the use of the common American foxhound in tracking escaped convicts in the Southern States.

I do not think I can do better than to refer M. De Varigny to the Century Magazine for June, 1889, and also to the same magazine for June, 1902. In the former number he will find a valuable history and description of the English bloodhound, written by the noted English breeder and fancier, Edwin Brough, who also gives his method of training his dogs to hunt "the clean boot."

In the latter number he will find an entertaining and well written article entitled, "Bloodhounds in America," written by J. D. Howe and Charles E. Duffie, in which the address of several prominent American breeders of bloodhounds is given, and also a history of numerous cases in which the famous dogs of Dr. J. B. Fulton, of Beatrice, Neb., have tracked criminals with unerring certainty.

Beyond all question the least understood dog of the present day is the English bloodhound. To the majority of persons the mention of his name suggests an enormous brute, ferocious and bloodthirsty as a man-eating tiger. As a matter of fact, the exact reverse of this is true, for the English bloodhound is the most affectionate and trustworthy of dogs, and excels all others in intelligence and value as a companion and friend. He is, par excellence, the gentleman's dog, being cleanly in his habits, and in his peculiar style one of the most beautiful of dogs.

But in nothing else does he excel so greatly as in his wonderfully acute sense of smell. I have had no experience with bloodhounds in hunting men, but have seen something of their work on game animals, and will relate one episode which came under my observation which will serve to illustrate the almost miraculous power they possess which enables them to trail their quarry under the most adverse conditions.

It was at Chain Lakes, Hamilton county, New York, in 1889 during one of my annual deer hunting trips with a party of my friends. We were stopping at Chain Lakes House, kept by Arvin Hutchins. It was in the days when hounding was lawful, and as I now remember it, there were about forty deerhounds on the premises at the time. Some of these dogs were owned by Hutchins, some by the guides who were working for the visiting sportsmen, and some by these sportsmen. Talk about music. We heard it there. The air was full of it and the mountains rang with it, when, on a frosty morning, those forty dogs were clamoring to be unchained and taken into the forest for a day's hunt. One of these dogs was a thoroughbred bloodhound, with great big mournful eyes, low hanging ears, flews and dewlap, which were soft and sleek as satin, and his mien would have done credit to a supreme court judge. The bloodhound is a rare animal, and I believe none of the guides had ever seen a genuine specimen before, consequently they were anxious to start him on a trail and see what he could do. His owner valued him highly, and consequently was somewhat reluctant about having this done, fearing he would lose the dog. The guides assured him there was no danger of this, as the deer would be certain to throw the dog off the trail by crossing one of the many large lakes in that section, if not killed before they had a chance to do so. To this the dog's owner said, "There is no water between here and the Atlantic Ocean large enough to throw that dog off a trail. Only the death of the dog or the deer could do that." However, his consent to starting the hound was finally secured, and the dog was laid on a trail.

His quarry was driven to water at Third Lake at a point where it is about a mile in width. The deer was met midway in the lake by one of the hunters, who was a novice in hunting and shooting, and the result was a somewhat laughable race and shooting match terminating in the escape of the deer. And then came the wonderful work of the hound. Without the least pause at the shore of the lake he plunged in and swam, following, as nearly as could be judged, the exact course the deer had taken, constantly giving tongue to the deep bell-like voice for which this breed of dogs is noted.

Again the deer was driven into the lake, but this time, fortunately for the dog's owner, the deer took water near a watcher who had some conception as to what the sights on his rifle were for, and the result of the second race was a dead deer. On his way back to the shore of the lake the successful hunter met the hound swimming in the lake, and pulled him into the boat on top of his quarry.

This race furnished a topic for lively discussion around the fireside the following evening, and among the dozen guides and score of sportsmen there was not one who could say he ever before saw anything in the line of running, or rather swimming, trails which equaled it.

I understand the use of bloodhounds for tracking criminals is becoming quite common in the Western States,

but I have heard of no cases in the Eastern States where they have been used for this purpose, which seems to indicate that the West is more advanced than the East in methods of detecting crime and criminals, as well as in some other matters.

JOS. W. SHURTER.

GANSEVOORT, June 22.

Editor Forest and Stream:

Several of us have told what we know of man-hunting dogs, and the subject may not be worn threadbare yet. I do not know if it has been or not. My first introduction to these dogs was while I had the honor to be a guest at Andersonville Prison in 1864. I was sent there because I had been caught out on the skirmish line shooting at our brothers in gray. I had been in the stockade about two months, when I was taken down with the scurvy and had the good fortune to be sent out to the hospital when few of us could get to it. There the chief surgeon, Dr. White, soon had me cured again, then was kind enough to get me a parole of honor from General Winder, so that I need not go into the prison again. I could now go where I pleased as long as I kept inside of the outer guard line a mile away.

I knew that there were bloodhounds here and hunted them up. They were kept in a pen near headquarters, and were always kept tied and were never more than half fed. There may have been a policy in keeping them half starved; at least I think so. I scraped up an acquaintance with them and began feeding them on corn bread; meat was too scarce just then to feed any to dogs. While I was feeding them one day old Captain Wirtz, our jailer, caught me at it and I thought he would have a fit. After he had cursed me awhile in broken English (he spoke poor English), he told me if he ever caught me near those dogs again he would blow my blanked head off, and began to finger his pistol as if he meant to do it right there. That did not scare me, though. I was here under a parole from Winder and knew that he was far more afraid of Winder than I was of him.

"Do you know what I have these dogs here for?" he asked.

"Yes," I know all about it."

"Well, then, you keep away from them. I may have to send them after you one of these days."

"You might as well not send them after me if I left, Captain. Those dogs would not hunt me now."

He warned me again not to be caught feeding them after this, and I took care that he did not catch me, but the dogs got fed as usual.

These dogs were much like the one I afterwards had, part foxhound, and here in camp were not dangerous; but when on a man's trail, if they caught him, they would tear him badly. I have seen men who escaped and were brought back there who were badly hurt by them.

30-Aug. 1-4-6-8. New York trial races for selection of defender of America's Cup.
31-Aug. 1. Gulfport, Southern Gulf Coast Y. A., Gulfport, Miss.
31-Aug. 18. Keystone, cruise, rendezvous, Woodmere, L. I.

SHAMROCK III. had her first trial against Shamrock I. in American waters on Saturday last. The start was made off Scotland lightship, and the two boats beat down the Jersey shore for eight or ten miles. They then held along on a close reach for several miles further, and after this had a spinnaker run back to the lightship. During this test, although it was hardly more than a sail-stretching spin, the challenger was able to leave Shamrock I. with the greatest ease.

Shamrock I. was towed from her moorings down to Scotland by the big tug Cruiser, while Erin looked after the new boat. The breeze was very light from the south, having a strength of about three knots at this time, but during the test was never over six or seven knots, and there was a long ground swell on. Both boats had jib-headed topsails set over their mainsails, and baby jib topsails over jibs and staysails. The Ratsey canvas on the challenger was almost faultless.

At the start Shamrock III. had taken a position on the lee bow of the older boat. They went off on the port tack and in a little over fifteen minutes after getting away Shamrock III. had worked across the older boat's bow and was some distance out to windward. If anything the challenger pointed a little higher and footed much faster than Shamrock I. After being out about half an hour the boats were brought up in the wind and jack-yard topsails were sent aloft on both of them. When these sails were properly set the two boats were again put on their courses. Shamrock III. gained steadily on Shamrock I. during the two hours and a half that they were being tested on windward work. When Shamrock I. luffed up and waited for the challenger to run back to her, it took some minutes for Shamrock III. to cover the distance that lay between them.

When the boats again started off they were put on the port tack, Shamrock I. in the better berth, as the new boat was some distance astern and well to leeward. However, she soon drew through Shamrock I.'s lee and worked well into the lead. After holding this tack for about three-quarters of an hour, Shamrock III. was a long distance in the lead and she was kept off and headed back toward the lightship. Sheets were eased on the older boat and she reached down on the challenger and was kept on after her. When about three lengths astern spinnakers were set on both boats, and although Shamrock I. was in a good position to blanket Shamrock III. she continued to draw away, and when the boats passed the lightship the challenger was about ten minutes ahead.

Shamrock III. has a rather pretty rig, although it impresses one as being rather smaller than Reliance's. The challenger moves through the water easily, and makes but little fuss forward, and she leaves the water very clean aft.

Sir Thomas Lipton and Mr. William Fife were on board Shamrock III. and Colonel Neill was on the old boat.

The boats will be given constant trials during good weather from now on until the Cup races, and by that time the boat and her crew should be in superior form.

The Canada's Cup Defender.

TORONTO, June 27.—Strathcona's stock has gone up with a jump owing to her magnificent performance of last Saturday. Pitted against the famous English racer, Gloria, the winner of international trophies in the Mediterranean, the new flyer made a record which is yet to be excelled by any Canadian yacht. Gloria has all along been regarded as the fastest craft on Lake Ontario, or, for that matter, on fresh water. She has not figured very prominently in the races because she has been debarred from all but special contests on account of the regulations of the lake scantling table. But her speed is beyond a doubt, and there is practically a standing challenge to the local fleet for a race from Toronto to the Niagara bell buoy and back, her owner, Mr. H. C. McLeod, having offered a pair of marine glasses to any yacht that would complete the sixty miles or so within an hour of Gloria's time. Mr. McLeod still has the glasses.

Gloria and Strathcona left the harbor Saturday afternoon in company with Merrythought, Commodore Æmilius Jarvis' fine craft. Merrythought was under her cruising rig, that of a yawl, and bound for Oakville. The two cutters carried working topsails and ordinary canvas. It was the first time Strathcona had been seen under kites, and, as prophesied, the leach of her gaff topsail was horizontal. Her gaff peaks high and her topmast is short. Strathcona's topsail was not much better than a bag, off the wind, as it had not been stretched properly, but it did some pulling.

The three sailed in the order: Merrythought, Strathcona, Gloria, with the light east wind right over the taffrail. Outside they hauled up a trifle for a long stretch up the lake, and flew off with the wind over the port quarter, blowing at times ten miles an hour, and at times less. The three went out of the piers separated by intervals of about two hundred yards, and they commenced their procession up the lake for ten miles. In all that distance the peerless Gloria could not catch Strathcona. Although she is ten feet longer on the waterline and spreads 1,100 feet more canvas, or three feet to Strathcona's two, the English flyer could not make up the start she had given the new boat.

Merrythought, an all-Canadian craft that has defeated the best fresh water designs of Fife and Watson, was by this time well under the lee of the two cutters. She held on for Oakville and the others flattened in their sheets for the beat back to Toronto.

But even in the windward work the larger racer could not do much against the Canada's cup defender. Strathcona pointed a trifle higher, but did not foot so fast. The two started back on even terms, and after beating for five miles Gloria was just able to cross Strathcona's bow. Then they exchanged skippers, Mr. H. C. McLeod went

to Strathcona's tiller, while Mr. G. E. Macrae took Gloria. The beat to windward was continued. Strathcona did a trifle better and the two held close together until near the Eastern Gap. By this time the wind had become light and fluky, and in a favoring draft Gloria disengaged herself from her rival and entered the harbor first.

The sail was a most satisfying one and showed that in light airs Strathcona is dangerous even for such a craft as Gloria. It cannot be credited that Irondequoit will prove faster than Mr. McLeod's cutter, for the latter was built under rules that permit of greater sacrifices to speed. While Gloria is ten feet longer on the waterline than Strathcona, she has a foot less headroom, showing that she is much more cut away. In a good breeze the longer boat naturally is able to leave Strathcona astern, but whether she would save her time allowance is doubtful. In a light breeze Strathcona seems able to hold her own well.

Strathcona has been sailing so far under her Toronto canvas. It is a well made, narrow clothed, cross-cut suit, and while not yet setting perfectly is coming out well. The mainsail has a flowing leach. Its wrinkles are disappearing. Her English suit has been ready for some time, but it will not be bent until Mr. Ratsey, of Lapchorne & Ratsey, can personally superintend the operation.

Gloria has departed on her cruise on salt water. Her owner will be with her in New York for the America's Cup races. While this deprives Strathcona of a valuable trial boat, there is good material left for her in the Royal Canadian Y. C. fleet in such flyers as Merrythought, Yama, Canada, Vreda, Azzie and Zelma.

As a matter of fact it is impossible to put up a boat against Strathcona in trial races that will show exactly what she is worth, because Strathcona is the only Canadian yacht of her kind. She is the only 40-footer built under the new rule. The same thing applies to Irondequoit. This makes the contest all the more interesting, because however great evidences of speed are shown by either boat, there is no standard by which they can be compared. What they will do when they come together remains to be guessed at.

Strathcona appears to travel slightly by the head when running free. It was noticeable in her brush with Gloria that her dolphin striker was in the water all the time. Her sailing by the head does not, apparently, affect her speed. If necessary it could be remedied by substituting a hollow topmast for the solid one carried at present. Strathcona has a hollow topmast in readiness; this spar, like her others, having been made by Capt. James Andrews, of Oakville.

In a brush under lower sails only on Thursday, June 18, Gloria got away from Strathcona in a beat to windward. This was in a light breeze, lower canvas only being carried, because Strathcona's light sails were not ready then. The proportion of Strathcona's lower canvas to her total sail area is very large, much larger than Gloria's, the McLeod cutter having a mainsail of short hoist and a long topmast. On this account it was thought that when the two would come together under whole canvas Strathcona would be badly beaten; but she did better under topsails than she did before, one of the curiosities of sailing. Strathcona and Gloria have not yet had a brush under cub topsails, and one should prove interesting.

It is almost certain that Commodore Æmilius Jarvis, who has sailed every Canadian winner of the Canada's cup so far, will handle Strathcona in the great contest.

CHARLES H. SNIDER.

Seawanhaka-Corinthian Y. C.

OYSTER BAY, LONG ISLAND SOUND,

Thursday, June 25.

The first of the series races given by the Seawanhaka-Corinthian Y. C. was held on Thursday, June 25. Three classes filled and there were twelve starters.

The 30-footers and raceabouts covered a triangular course twice. The course was from the starting line N. N. W. two miles to and around a mark, thence E. by N. ½ N. two and one-quarter miles to a mark, thence S. W. by S. two and one-half miles to the starting line, a distance of six and three-quarter miles. The wind was light from the S. E., making the first leg a run, the second a reach and the third a close reach.

There were two starters in the 30ft. class, Alert and Flosshilde. The latter boat showed up well and won easily. At the end of the first round Flosshilde had a lead of over three minutes, which she increased on the second round and won by 4m. 2s. Alert's defeat was a great surprise, and up to this time she had had no trouble beating Flosshilde. Alert is, if anything, the smarter boat of the two, and the great difference in the times shows that the racing between them was quite unsatisfactory.

There were five starters in the raceabout class, but only three finished, as Mavis and Scamp withdrew. Nathalie won by a big margin, being 8m. ahead of Mystery at the finish. This was the fourth race for the Jennings' cup.

Five of the Seawanhaka one-design 15-footers came to the starting line and all finished but Bairn. Cayenne was leading Wee Weam by a minute at the end of the first round. On the second time around Cayenne did even better, and won by 2m. 55s. The summary:

30-foot Sloops—Class N—Start, 12:15.		
	Finish.	Elapsed.
Alert, J. W. Alker.....	2 54 55	1 54 55
Flosshilde, W. D. Hennen.....	3 04 26	2 04 26
Alerion, A. H. Alker.....	3 28 30	2 28 30
Little Peter, F. M. Weeks.....	Withdraw.	
Raceabout Class—Start, 12:25.		
Jolly Roger, T. B. Bleeker.....	6 21 36	5 56 36
Nathalie, F. G. Stewart.....	6 10 30	5 44 30
Mystery, Johnson De Forest.....	6 18 30	5 52 30
Mavis, G. L. Pirie.....	Withdraw.	
Scamp, H. L. Maxwell.....	Withdraw.	
Seawanhaka 15-foot One-Design Class—Start, 12:35.		
Bairn, W. D. Matheson.....	Withdraw.	
Bobs, W. A. W. Stewart.....	6 40 32	6 05 32
Cayenne, Colgate Hoyt.....	6 36 35	6 01 35
Imp, H. H. Landon.....	6 40 18	6 05 18
Wee Wean, R. L. Cuthbert.....	6 37 30	6 04 30

The winners were: Flosshilde, Nathalie and Cayenne.

FRIDAY, JUNE 26.

The second of the series races held on Friday, brought

out many more starters than on the previous day; in consequence the races were more interesting.

The start was scheduled for 12 M., but as there was little or no wind at that time, the preparatory was given, however, at 12:45, as a good breeze had come up from the south. All the boats sailed over the long course, which was from the starting line N. N. W. three miles to a mark, thence E. by N. ½ N. four miles to a mark, thence S. W. by S. four and three-quarter miles, a total distance of eleven and three-quarter miles. The first and second legs were reaches, while the third was a beat.

Boats in class N were sent away at one o'clock. Alert led over the line, with Alerion astern but to windward, while Flosshilde and Little Peter crossed in Alert's wake. Alert led from the start, and finished an easy winner, and turning the tables on Flosshilde, which had won the day before.

At 1:05 class P sloops and the raceabouts started. Dorothy led over the line in her class, followed by Lucille and Chingatchook.

Mavis was the first of the raceabouts to cross, followed by Jolly Roger, Mystery, Hobo, Cricket, Grasshopper and Indian, in the order named.

Bairn showed the way to her competitors at 1:15. Bobs, Yo San, Imp, Sabrina, Cayenne and Chipmunk II. followed, in the order given. The summary:

30ft. Sloops—Class N—Start, 1:00.		
	Finish.	Elapsed.
Alert, J. W. Alker.....	2 54 55	1 54 55
Flosshilde, Fennen Bros.....	3 04 26	2 04 26
Alerion, A. H. Alker.....	3 28 30	2 28 30
Little Peter, F. M. Weeks.....	Withdraw.	
Sloops—Class P—Start, 1:05.		
Lucille, P. Williams.....	3 03 24	1 58 24
Chingatchook, E. A. Stevens, Jr.....	3 49 31	2 44 31
Dorothy, L. G. Spence.....	3 52 36	2 47 36
Raceabouts—Start, 1:01:05.		
Jolly Roger, T. B. Bleeker.....	2 25 50	1 30 50
Hobo, T. L. Park.....	2 36 13	1 31 13
Mystery, Johnson De Forest.....	2 40 35	1 35 35
Grasshopper, H. Preyer.....	2 40 47	1 35 47
Mavis, G. L. Pirie.....	2 43 19	1 38 19
Indian, G. L. Pirie.....	2 44 29	1 39 29
Cricket, H. Willets.....	2 56 50	1 51 50
Seawanhaka 15-foot One-Design Class—Start, 1:15.		
Cayenne, Colgate Hoyt.....	2 31 50	1 16 50
Yo San, F. A. Plummer.....	2 34 26	1 19 26
Imp, H. H. Landon.....	2 35 58	1 20 58
Bobs, W. A. W. Stewart.....	2 36 60	1 21 50
Bairn, W. J. Matheson.....	2 37 34	1 22 34
Chipmunk II., F. S. Young, Jr.....	2 45 06	1 30 06
Sabrina, C. W. Wetmore.....	2 50 46	1 35 46
We Wean, R. L. Cuthbert.....	Withdraw.	

The winners were: Alert, Lucille, Jolly Roger and Cayenne.

The real interest of the day was centered in the inter-club racing between the boats of the American Y. C. and boats of the Seawanhaka-Corinthian Y. C. Each club was represented by three boats, Lania, a new boat designed by Mr. Clinton H. Crane for Mr. A. C. James, was one of the representatives of the Seawanhaka-Corinthian Y. C. She was cleverly sailed by her designer. While the racing was close enough to be interesting, the boats belonging to the Long Island organization had rather the best of it. The races were decided on points, the Seawanhaka-Corinthian Y. C. securing 12 while the American Y. C. got but 8. The boats sailed twice over a triangular course. The summary, start 1:35:

Seawanhaka Corinthian Y. C.'s Representatives.			
	1st round.	Finish.	Elapsed.
Lania, A. C. James.....	3 05 20	4 23 02	2 48 02
Merry Wing, H. M. Crane.....	3 09 56	4 24 19	2 48 29
Nathalie, F. G. Stewart.....	3 12 10	4 28 57	2 53 34
American Y. C.'s Representatives.			
Howdie, S. Wainwright.....	3 09 22	4 23 36	2 48 36
Jolly Tar, S. Howard.....	3 10 40	4 24 58	2 49 58
Rascal, S. C. Hopkins.....	3 08 51	4 28 44	2 53 44

Saturday, June 27.

The third and last of the series races and the annual regatta were scheduled for Saturday. The race was quite without interest, as there was no breeze during the day. Some of the boats caught occasional puffs from the south-west, but they were becalmed most of the afternoon. About six o'clock the breeze struck in from the W. S. W., which enabled some of the boats to finish at the end of the first round. The boats started as follows:

1:20—Neola and Weetamoe.
1:25—Effort and Mimosa II.
1:30—Alert, Flosshilde and Alerion.
1:35—Lucille, Mystery, Chingatchook, Hobo, Nathalie, Grasshopper, Indian, Mavis, Dorothy, Cricket, Rascal, Adelaide, Jolly Roger, Rochelle, Jolly Tar, and Hourie.
1:45—Chipmunk II., Cayenne, Bobs, Bairn, Sabrina, Imp, Wee Wean, and Olita.
1:50—Why Not, Gosling, Scud, and Alga.
2:05—Knave, Capar and Ace.
2:15—Jeebi.

The boats worked their way slowly down to the first mark with the aid of their balloon jibs, but after that they drifted along with the tide.

No official summary. The winners were: Neola, Mimosa II., Anokatok, Alert, Adelaide, Nathalie, Sabrina, Capar and Jeebi.

Indian Harbor Y. C.

GREENWICH, LONG ISLAND SOUND,

Saturday, June 27.

The Indian Harbor Y. C. gave a handicap race for club boats 36ft. and under and a race for the club's one-design class of sailabouts. The boats in the handicap class sailed twice over a five-mile course, and the sailabouts covered a three-mile course twice. In the early part of the afternoon there was no breeze and the start was postponed, but later a light southerly breeze came up and the boats were sent off. The summary:

Club Handicap.		
Montauk, W. Sheldon.....	4 15 00	6 48 05
Eos, E. Mead.....	4 17 00	6 56 50
Trouble, W. H. Childs.....	4 22 00	6 53 37
Snapper, F. H. Page.....	4 32 00	6 51 04
Robin Hood, G. E. Gartland.....	4 35 00	6 56 40
Vigeth, W. Hanan.....	4 35 00	6 54 08
Sailboats.		
Queenie, Frank Tilford.....	4 05 00	5 56 21
Stingy, E. Zittel.....	4 05 00	5 51 50
Betty, Swords & Hyde.....	4 05 00	5 54 11
Bug, G. F. Dominick, Jr.....	Withdraw.	

The winners were: Montauk and Stingy.

Annual Cruise of the Goodenough.

Story Submitted in "Forest and Stream" Cruising Competition.

BY FRANK F. FRISBIE, DETROIT, MICH.

To fish the stream well one must wear waders, but it is not a stream one can wade in all places.

We made several good catches on the Batchewana in '02. The Skipper one day five fish eleven pounds, another day five fish twelve and a quarter pounds, the Doctor eleven fish six pounds, while the Professor had eleven eight pounds. Small trout can be taken galore, but if one tries only for the big fellows he will not take so many.

Time flies and Ed. said he must go home, so we sail once more to the station and put him aboard the Dixon, but on the following trip up, we received another guest from Detroit, a lawyer friend, who, though sixty-five years have frosted his beard, loves to go a-fishing.

Soon after he comes aboard, we get sail on and stand out of the bay round the lower end of Batchewana Island for Commodore Island, which lies east of Rudderhead and south of Batchewana Island. We have to handle our craft with care here, as there is foul ground about the island, but when once in behind the island, we are in as

THE LOCKS AT SAULT STE. MARIE.

fine a little harbor as one can find and where we could lie safely through any old blow. From this anchorage we fish Rudderhead reefs and the shore to the eastward. Here we take all the trout needed and ramble in the deep forest of the mainland. While lying here an Indian came after a deer he had killed not far away, and we went aboard his small two-masted fish boat. He was cooking some tea. The Indian cooks tea. He boils it and boils it, until it is like lye. He had quite a scheme for building a fire in his boat. It consisted of a sheet-iron cylinder, with some dirt in the bottom and a hole or two punched in for draft. In this he built a fire of small sticks and hung his tin tea pail inside; in a few moments it was boiling furiously. The Professor tried to get a photograph of the outfit, but it was not very satisfactory, as he could not get far enough away in the small boat.

After some time spent in under Commodore Island we took advantage of a favorable breeze and slipped in through between Batchewana Island and the main land toward the head of the bay. Here was another favorite anchorage, near a rocky island in a sedge-bordered bay, where we sometimes found bass.

While the Skipper and the Doctor prospected in the small boat, the Professor sailed the yacht through the straits. He had to make several tacks to get in, but as the wind was light it was easy work to handle the schooner with Percy's assistance. In fact, one man can handle the Goodenough in a light breeze, as her staysail sheet leads aft and if necessary to let go to come in stays, it is easy to get at. With much wind and especially if he wanted to be sure that he would not miss stays, he might have trouble if alone, and not quick enough. Anchored in the little bay behind the island, we were very snug and a squall which went over was not noticed. The sun shone warm and with not much breeze, we needed our awning over the cock-pit. Then table and chairs were gotten out and we had a comfortable place for a game of cards.

We fished for bass a little, but they did not care to be taken out of the wet, so more loafing was done than fishing. The Skipper did some exploring in the small boat and all did some sleeping.

We once in a while get up early enough to see the sun rise and when we do, the scene viewed from the deck of the yacht when at this anchorage is beautiful. A rainy, misty, cloudy morning came, and as the sun came up over the high hills back of the distant Chippewa, trying in vain to disperse the low-lying, heavy moisture laden clouds, it well repaid us for being routed so early. A photograph was made, but it lacks the coloring and is very unsatisfactory. If one could only reproduce some of the gorgeous effects of color seen in the sunrise and sunset of this north land, the result would astonish those who have never witnessed them in nature.

After some time at the little island which we have christened Skeeter Island, from the fact that Billy, one of our friends, was driven off of it by the buzzing pests, we made sail for the lower bay, visiting the Chippewa on the way again, where the Doctor took some bass and some of the crew rowed up to the falls and took a few pound and pound and a half trout. We got back in time to get to our anchorage near the fish station by ten o'clock P. M., after a four hours' sail. We found more friends from the Soo at the station and some strangers with them from Albany, New York, who had come to the north shore for fishing. Our friends came up in a 30-foot gasoline launch. We had the crowd over for a baked trout supper, served in Percy's best style, and

the gentlemen from Albany admitted baked Lake Superior brook trout were up to the mark.

We had not fished the Carp River this season, so we got the hook up and with a light breeze which threatened to either head us off or fail altogether, we manage to make our anchorage about a quarter of a mile from the mouth of the Carp. There is a sand bar extending some distance out and there is hardly water enough on it to float a small boat.

The Carp River is so named because there are no carp in it. The stream is between the Batchewana and the Chippewa in size, and about six miles from its mouth in an air line are some very beautiful falls and a very picturesque cañon.

The lower stretch of the Carp can be fished by rowing up the river a mile or two and then wading. The upper stretch is best fished by walking up to the falls and then fishing down stream until a road is reached that leads in a straight line to the anchorage.

We spent several days on the Carp and fished the upper and lower stretches of the river. The day in question we all went up to the falls and spent the day admiring the beauties of the cañon and falls. The river descends from the height of land in a succession of falls, each one jumping into a pool and then plunging down another steep. On one side the rocks are nearly perpendicular and can only be scaled with difficulty. At the lower fall, a large pool of crystal clear water contains a goodly number of trout, and we caught enough for dinner and soon had them broiling over a camp fire. It is strange how much better a fish tastes cooked out of doors in this way than when served on a platter in the orthodox manner. Below the falls in the cañon there are a succession of cascades and pools, each one good for one or more trout. Huge boulders and rocks, some encrusted with earth enough to support vegetation and trees, fill the cañon, while on each side rises a nearly virgin forest. After fishing the Carp thoroughly and getting photographs of the falls, we again felt like sailing, but the beautiful river with its falls, cascade, rapids and shadowy pools was hard to leave. Some of the shadow effects which we saw on the lower stretches of the river were fine, but it was aggravating not to be able to reproduce them with the camera.

YACHT GOODENOUGH AMONG THE FREIGHTERS, SOO CANAL.

Again we point our prow for the fishing station anchorage and the Tuff Enough, the Skipper's pet name for the yacht, generally contracted by all into the Tuff, dashes the rippling waves of the bay aside as she bowls along under full canvas with started sheets.

The scribe of the party after hearing the Skipper rename the Goodenough one day, seized his pencil and labored on the following, which has been dubbed the hymn of the Goodenough:

"This is the craft that sails the inland sea,
And tho' she's Tuff, she's Goodenough for me.
Oft times we growl at the old Tuff,
But vote at last she's Goodenough.

"The Commodore some change would make,
The Mate her windlass votes a fake,
But one and all say she's the 'stuf,'
And rightly named the Goodenough.

"When winds do blow and seas are high,
She rides them with her decks quite dry,
No matter if it comes with squall or puff,
The Tuff's on top and Goodenough.

"Tho' one and all seem quite inclined
With this or that some fault to find,
But after all, be it calm or rough,
We'll swear the Tuff is Goodenough."

While at anchor we saw the ketch-rigged yacht Cero, of New York, come into the bay and go up toward the Chippewa. This yacht was brought from salt water via the St. Lawrence and Welland canals. She is about 60 feet over all and has an auxiliary gasoline engine. Her owner is a gentleman who has become enamored with the north shore and has been on it for several seasons and has owned several yachts. The Cero is a very fine looking craft and seemed to be a good boat for north shore cruising, but on our way down we heard she had been caught out in a gale and had a very hard time. The Cero did not anchor near us, but we saluted her with bugle calls, to which she replied in kind. Chief Justice Shiras, we understood, was on board with her owner. The justice is a regular north shore visitor, as we have met him several seasons.

August was nearly gone and we had to go south before the first, as much as all the crew would like to linger. So the Skipper kept his weather eye open for a favorable wind and on the morning of the 28th, when he poked his head up the companionway, he sniffed a northeast wind. The bugle soon sounded the stirring notes of the reveille and all hands were on deck in no time in pajamas or any old thing, walking the yacht up to her anchor. As

soon as hove short stops were cast off, mainsail hoisted, sheet hauled taut and then the windlass clanked merrily until the hook was aweigh, up went our head sails and hard over went the wheel. The Goodenough slowly came about with the light breeze just filling her sails and soon her nose was pointing out of the bay. It was only five o'clock and we hoped the wind would freshen as the sun got higher, but it did not, and at nine o'clock we had only made Rudderhead. Here our wind flattened out and we hardly had steerage way, still we slid along, for it is wonderful how a craft like the Goodenough will creep over the water when apparently there is no wind. Drawing so little water and being nearly flat-iron shaped, she offers very little resistance.

We were in for an all-day drift, for as the sun rose higher and higher, the breeze became lighter and lighter. We got the table on deck and prepared to put in the time as comfortably as possible. The lake was as smooth as the proverbial mirror, and the deep water was nearly inky black, it was so clear. The water of Lake Superior is very peculiar in its color. When near the shore, so one can see the bottom, there does not seem to be any color, it is so clear and crystal-like, and one can see twenty or twenty-five feet into its limpid depths, but when in deep water it looks dark and black.

About four P. M. we were off Maple Island and the Skipper and Doctor lowered a small boat and rowed over to the reefs, to try for a trout. They had several rises but did not hook anything. There is good trout ground here.

OPENING THE GATES "SOO" LOCK TO LET GOODENOUGH OUT.

While drifting along these shoals, we saw a little tragedy enacted. We noticed a slight ripple on the water as if something was moving and presently saw a poor sick trout, of about eight inches, swimming on the surface. The poor little fellow seemed to be in bad shape and he wiggled by the yacht very slowly. We watched him over our stern, until he had gone fifty yards or more, then we saw a great gull swoop down and snatch the little fish up and rise into the air; before the gull had fairly gotten on wing again, the fish had gone where its sorrows and troubles were over.

Now our calm is broken by a slight breeze, but it is from the southeast and nearly dead ahead. We push our booms over to the starboard and try to get the yacht to head toward Parisian Island. As the sun sank into the west, the breeze freshened, but we could not make much on this tack, and when we came about did not seem to hold our own on the other. We debated the question, whether it would not be better to run up into Goulais Bay for the night, but decided as the wind came out of the bay, we would have to beat in and it might take nearly all night to do it. We had had that experience the year before. So the Skipper said sail on, and we sailed. At 7 o'clock the Professor got out the signal lights, as we were now down where the big steamers pass, and at 8 o'clock everybody turned in excepting the Skipper and Professor, who put on their heavy coats, as the night was cold and a winter ulster was none too warm. Our wind freshened and soon the yacht began to heel and dash the spray over her bows, but we made very little headway, and it was stand back and forth and keep our eyes peeled for the great freighters and their tows. About 1 o'clock we had gotten down nearly abreast of Iroquois Light, which we could see flashing every 30 seconds out of the gloom, and then began a race with a Pintsch gas buoy off of Gros Cap reefs. The wind now freshened into half a gale and the Tuff jumped and plunged as she took the choppy seas. The Professor had hard work to keep her on her course, as she would fall off and then when he would give her wheel, she would get a sea under her bow and come up too quickly. We had to make short tacks and not get too far inshore, so quick work had to be done, as it would not do to miss stays, when a 400 ft. iron freighter was coming down on us 14 miles an hour. The Skipper would sing out, "Let her come," and jump for the staysail sheet, let it go and then to the fore sheet, which he would slack. Round would come the yacht, everything creaking and snapping. The great foresail would fly over and be brought up with a bang, as the wind caught. The Professor would meet her with the wheel, steady her and then heave down on the staysail sheet, until the Skipper could make it fast. The Skipper would rush forward to change the smokestack, so the galley stove would draw and keep a fire going to keep the coffee hot; so all in all, there was something doing on the Tuff Enough.

The Skipper said he would not turn in, so the Doctor was called to help out and the Prof. turned in about 2 A. M. We had now gotten below Iroquois Point and about 3 A. M. the wind blew itself out, and about five in the morning it was nearly a calm, and we let go our hook just outside of the steamboat channel off Point Aux Pins, six miles from the Soo. Having seen the sun rise, we all turned in and did not rise ourselves until the Skipper's bugle played mess.

At eight o'clock a little wind came up and we thought

with the aid of the current, which from this point is very perceptible, we could make the canal, though it was a beat for it, but beating down the river was a different proposition in a light wind from trying to get up.

We got sail on and slowly left Point Aux Pins astern, and before noon put the Goodenough's nose into the ship canal. We had to get the canvas off of her, as we could not tack in the canal, and the Skipper and Doctor, assisted by Percy, who was now wide-awake, as he spied his family watching for papa on the banks of the canal, took a tow-line and walked the yacht down to the lock. We went into the old or Weitzel lock, and as we were locking through, it might not be out of place to give a few statistics, even if they are out of place in a yachting article. The Soo is one of the most interesting places to-day in the United States, if not in the world. It has two of the largest ship locks in the world. The Poe lock is 800 feet long, 100 feet wide and 21 feet deep over mitre sill. There is over twice as much tonnage passing through the canal than through the Suez Canal. There is an immense power plant, just finished, with canal of over two miles, furnishing 60,000 horse-power, costing over four millions. On the Canadian side are immense pulp mills, steel plants and other industries that have grown up like magic. There is a lock, second only to the Poe lock, 900 feet long, 60 feet wide, 21 feet deep, costing four millions. The Soo offers much for the entertainment of the yachtsman tourist and for the sportsman; it has many and great attractions.

The great falls of the Ste. Marie's River offer exciting canoe rides with Indian guides and the trout fishing in the rapids is very fair. Down below the Soo a few miles is probably one of the best bass grounds in the country. We lock through and a puffing tug takes our tow-line and pulls us out of the lock into the river. Here we hoist our canvas and sail down to our anchorage. Store clothes are resurrected and one by one the crew take train and boat for the lower country. Each and every one feels, as did the scribe, when he, like Silas Wegg, dropped into poetry:

"The passing day is almost o'er,
We leave behind the loved north shore,
And fast approach our anchoring ground
For now our ship is homeward bound.

With sheets hauled taut, we swiftly glide
Down past the Soo with wind and tide;
The good old Tuff sails fast—too fast,
For, alas! play days too soon are past.

"As evening shades succeed the light,
Below we see the beacon bright,
And steer our ship toward the bay,
We furl our sails, the anchor drops away.

"A silent crew, too full each heart,
For now the time has come to part;
'Farewell!' 'Good-by'—these simple words enough—
We part, but hope to sail again upon the Tuff."

"AS WANING SHADES SUCCEED THE LIGHT."

Gloucester Y. C.
GLOUCESTER, DELAWARE RIVER,
Sunday, June 21.

The fourth annual regatta of the Gloucester Y. C. was held on Sunday, June 21. There was a large number of starters and the 15-mile N. W. breeze that prevailed throughout the race made the contests interesting and exciting. Several boats capsized, but the crews were picked up none the worse for their wetting, and the boats were towed back to their moorings.

The course was from off Market street wharf, Gloucester, to Chester buoy and return, a distance of about thirty-six miles.

The summary follows:

Whitehall Boats—Start, 11:45.

	Finish.
Maggie, J. Duffy.....	3 39 00
Marion, W. Nolan.....	3 39 30
Defender, J. Young.....	4 01 00
Admiral, H. Wolfinger.....	Withdrew.
James.....	Withdrew.

Third Class Open Duckers—Start, 12:01.

Baby Ruth C., C. Randolph.....	4 13 00
Emma C., J. Christie.....	4 28 00
Edna, F. J. Murray.....	4 17 45
Martha C., J. Minahan.....	Withdrew.
Henry B., W. Christie.....	Withdrew.
Henry Moulton, G. Ritter.....	Withdrew.
Sam C.....	Withdrew.

Second Class Duckers—Start, 12:15.

Woodman and Florey, G. Smith.....	3 44 30
George B., George Pass.....	3 44 45
Lottie W., Harry Quinn.....	3 57 00
John Hirst, John Hirst.....	4 02 30
Catherine C., Ben Wilson.....	Withdrew.
Freda K.....	Withdrew.
Annie T.....	Withdrew.
Howard G.....	Withdrew.

First Class Duckers—Start, 12:23.

Joe McGinn, Arthur Henry.....	4 06 00
Minnie C., H. F. Cain.....	4 10 00
Hattie B.....	4 20 00
Jennie C., E. Eastwick.....	4 28 00

Eva, J. Chambers.....Capsized.
Charles Moulton, W. Ballentine.....Withdrew.
Annie, C. Matchinsky.....Withdrew.

Cabin Yachts—Start, 12:37.

Dorothy C.....	3 42 00
W. P. Naphy.....	4 07 30
Hornet.....	4 21 30

Open Yachts—Start, 12:39.

Colonel James O'Neil, C. O. Neil.....	3 58 30
John Engle, John Engle.....	4 21 00
James Hully, W. Flick.....	Upset.

Special Class—Start, 12:55.

Marie, W. Callum.....	3 47 30
Albert S., C. St. cross.....	4 17 30
Bessie, S. Y. Dorce.....	Withdrew.
Florence, W. Mace.....	Withdrew.

The winners were: Maggie, Baby Ruth C, Woodman and Florey, Joe McGinn, Dorethy C, Col. James O'Neil and Marie.

Old Mill Y. C.
Y. R. A. OF JAMAICA BAY,
Sunday, June 21.

The open regatta of the Old Mill Y. C. was held on Sunday, June 21. The weather was dull and rainy, but even under these unpleasant conditions twenty-three boats came to the starting line.

It cleared a little about three o'clock and a steady breeze from the N. by E. held the balance of the afternoon. The course for sloops, catboats and launches was from the mouth of Spring Creek, down Main Channel, to the spar buoy, off Barren Island and return; for sharpies, starting at the same point to and around the Canarsie breakwater and return.

The launches were started first so that they might be out of the way of the sailboats.

The summary follows:

Sloops.			
	Start.	Finish.	Elapsed.
Baby Roger	4 00 18	6 47 33	2 47 15
Dolly	4 01 26	Not timed.	
Kismet	4 01 12	6 52 20	2 51 08

Open Cats—Over 20ft.			
Selfish	4 15 50	Withdrew.	
Bill Nye	4 10 00	6 11 15	2 01 15

Open Cats—Under 20ft.			
Vision	4 10 35	6 31 43	1 21 08
So So	4 11 20	6 25 10	1 13 50
Harry C. Miner.....	4 11 00	6 40 05	1 29 05
Amaranth	4 11 20	6 40 20	1 29 09
Lechinvar	4 12 00	6 30 20	1 18 20
Lucy	4 11 33	Not timed.	

Sharpies.			
Lester	4 15 21	5 06 34	0 51 09
Free	4 15 30	5 07 31	0 52 01

Pet	3 55 45	Withdrew.	
Ella	3 55 30	Withdrew.	
Eagle	3 55 30	5 21 11	1 29 41

The winners were Baby Roger, Bill Nye, So So, Lester, Wave and Eagle.

Bristol Y. C.
BRISTOL, RHODE ISLAND,
Saturday, June 20.

The Bristol Y. C. held its first regatta on Saturday, June 20. The race was sailed under squally and uncertain conditions. The 15-footer Unique, owned by Mr. James Whitehead, of Fall River, capsized at the end of the first round. The summary:

First Division—Class 1.

	Elapsed.	Corrected.
Lady Mary, William Aldrich.....	2 00 50	2 11 50
Nellie, John Oates.....	2 26 09	2 26 09

Class 2.

Opitsah II., Charles F. Tillinghast.....	2 11 35	2 26 09
Wanderer, Flint Bros.....	Withdrew.	

Second Division—Class 1.

Wild Swan, W. L. McKee.....	2 00 00	1 59 08
Grace, E. Catlin, Jr.....	1 47 39	1 47 39

Corinthian Y. C.
STAMFORD, LONG ISLAND SOUND,
Saturday, June 27.

The Corinthian Y. C., of Stamford, held a special race for the launches Hartford, Palmer and Æolus on Saturday, June 27. The race was to settle the championship of the 21-26ft. class of launches. The boats covered a nine-mile course and they were bunched the entire distance. Palmer would have won on time, but she was protested by Mr. Hatch, owner of Hartford, for fouling his boat several times during the race. The summary, start 3:25:

	Finish.
Hartford, W. P. Hatch.....	4 23 00½
Palmer, T. F. Smith.....	4 23 00½
Æolus, R. H. Gillespie.....	4 23 00½

Boston Y. C.
MARBLEHEAD, MASS.,
Saturday, June 27.

The club race of the Boston Y. C. was sailed off the club's station at Marblehead, on Saturday, June 27, in very fluky breezes, varying from west, southwest to southeast. In the 25ft. class there were two starters, Chewink III. and Great Haste. Great Haste was first over the starting line, and in the weather position, but Chewink was footing the faster of the two and pulled through Great Haste's lee. She hung to a most comfortable lead, until they had turned the second last mark, when the breeze flattened and Great Haste made a gain. On a short beat to the finish Chewink managed to hold the lead.

In the 22ft. class there was a good race between Opitsah V. and Medric, in spite of the fluky wind. Opitsah V. got the best of the start, but on the windward leg Medric went up on her, thus starting a luffing match, which took both high of their course. When they squared away with sheets lifted, Medric opened out a lead. On the next leg Opitsah V. was favored by a fluke, which enabled her to turn the mark inside Medric, and from this out Opitsah V. led.

In the 18ft. knockabout class Malillian had the best of the start, with the rest of the boats pretty well bunched. There was a great scrap on the beat to windward, the lead being constantly shifted. Miss Modesty finally got the lead and turned the weather mark first. From this out the wind was fickle, and they did little more than drift. Rattler found this to her liking, and she went out to the front, finishing minutes ahead.

In the first handicap class, the 21-footer Opitsah III. and the 22-footer Setzu were the starters. Opitsah III. was given time allowance, but on account of flukes she won without it. In the second handicap class Dabster won, the other boats withdrawing. The summary:

25-footers.		
	Elapsed.	
Chewink III., F. G. Macomber, Jr.....	2 13 13

Beverly Y. C.
BUZZARD'S BAY, MASS.
Saturday, June 27.

The regular club race of the Beverly Y. C. was sailed off Wing's Neck, in Buzzard's Bay, on Saturday, June 27, in a rattling southwest breeze, which called for single reefs. The one-design 30-footers got away in a bunch, with Gamecock in the lead. On the beat down the bay they split tacks, and Praxilla went into the lead. She held her advantage to the finish. In the 21-footers there was a mix-up at the start. Jack Rabbit was over too soon, and in going back to recross, she was shot across the other boats, which were going over the line. She lost a minute by this and another 5m. in reefing. Barnacle again had things about her own way and won easily. In the fourth class cats Krieker had the best of the start, and led all over the course. There were ten entries in the 15ft. class, in which Spider was the winner. The summary:

West End Y. C.

NEW YORK, June 29.—The second annual regatta of the West End Y. C. was held on June 21. The day being very showery kept from contesting many boats that had entered. The course was from the club house, One Hundred and Sixty-third street, Hudson River, to a mark off the long dock on the Jersey shore, thence to another mark off the Fort Lee ferry house on the Jersey shore, then back to the judges' boats. Twice around for all boats, about 15 miles, flying start; a fresh N. E. breeze.

Cohasset Y. C.

COHASSET, MASS.,

Saturday, June 27.

The third club race of the Cohasset Y. C. was sailed off Cohasset on Saturday, June 27, in a fluky breeze from the southeast. In the 21-footers Delta won a good race. Result won easily in the 18ft. knockabouts. In the handicap class Undine won by a safe margin. The summary:

Duxbury Y. C.

SOUTH DUXBURY, MASS.,

Saturday, June 27.

The first race of the Duxbury Club of the season was sailed off the club house, South Duxbury, in a very light easterly breeze. Only the 18-foot knockabout class filled. Miladi got over the starting line before the gun fired, but in spite of this she caught the bunch and finished a winner. The summary:

	Elapsed.
Miladi, F. R. Williams	2 13 20
Aspenquid 2d, C. Foster	2 13 43

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Aspirant, the cutter built by Mr. B. F. Wood at City Island from designs by Messrs. Gardner & Cox for Messrs. Addison G. and H. Wilmer Hanan, will be launched on Tuesday evening, June 30. The yacht is well built, and a better piece of construction has never been turned out by any American yard. Mr. Wood acknowledged that he had given more attention to the building of Aspirant than any boat he had ever produced. She is double planked, cedar inside and an outer skin of mahogany. All the frames amidships are of bronze. Aspirant is 65ft. over all, 42ft. waterline, 12ft. 6in. breadth and 9ft. draft. She will sail her first race at Larchmont on July 4, and will meet Effort, Mimosa II. and Challenge.

The following schedule for power boat races has been made up and all the events will be held under the auspices of the American Power Boat Association: Saturday, July 11, Newark Y. C.; Saturday, July 18, Indian Harbor Y. C.; Thursday, August 13, Atlantic Y. C.; Saturday, August 29, Brooklyn Y. C.; Wednesday, September 9, New Rochelle Y. C.

The Regatta Committee of the Sachem's Head Y. C. has laid out the following racing events: Point races, July 4, 13, and 27, and August 17, 24, and 31; knockabout team race, July 6; ladies' race, August 10; annual regatta, September 7; annual cruise, August 3-8.

Eight yachts started in the race from Dover to Helgoland (a distance of three hundred and twenty miles) for the Emperor William cup. The boats made slow time over the course owing to head winds. The race was won by the yawl Fiona, owned by the Marquis of Camden.

We are indebted to Mr. Edward M. MacLellan, secretary of the Manhasset Bay Y. C., for a copy of the club's book.

Ingomar, the steel schooner designed and built by the Herreshoff Mfg. Co., was launched from the yard of the builders at Bristol on Wednesday, June 24. The yacht was built for Mr. Morton F. Plant. She is 127ft. over all, 87ft. waterline, 24ft. breadth and 14ft. draft.

The New York Y. C.'s book for 1903 has been distributed to the members. The book has been entirely revised by Secretary George A. Cormack, and it is by far the best book the club has ever gotten out.

The schooner Meteor, owned by Emperor William, won the race sailed off Kiel, Prussia, on June 26 for the American cup presented by Mr. J. P. Morgan.

Yachting has made great progress in Canada during the last few years. The Royal Kennebecasis Y. C., of St. John, N. B., organized a few years ago, has now a membership of 300, and a large fleet of small yachts and power craft. A new club was recently organized on the Miramichi, the Chatham Y. C., with J. L. Stewart as commodore; W. H. Tapper vice-commodore; E. B. Wyse, rear-commodore, and T. M. Gaynor, secretary-treasurer. Its fleet is small, but the veteran yachtsman at its head will, no doubt, make it a success.

Canoeing.**New York C. C.**

BENSONHURST, GRAVESEND BAY,

Saturday, June 27.

The third regatta of the Yacht Racing Association of Gravesend Bay held on the afternoon of Saturday, June 27, was by far the best given this year. An 8 knot breeze held steadily throughout the contest, making good times possible. The winners were Bonito, Squaw, Ogeemah, Spots and Jig-a-Jig. Pickininy scored a sail over.

In the catboat class Rascal finished ahead of Martha M. The latter, however, would have won the event on time allowance had not Rascal protested her for fouling at one of the turning buoys. The winner cannot be determined until the protest is acted upon.

The courses were sailed in reverse order, leaving all marks on the port hand. Boats outside had windward work to Craven Shoal Bell buoy, one or two close hauled boards to Red Can Buoy No. 2 off Coney Island Point and a reach home to the start off Ulmer Park. The other starters had a broad reach to the Marine and Field Club mark, a close reach to the buoy off Fort Hamilton, windward work to the stake boat off Sea Gate and a reach home. Both courses were covered twice.

Competition among the boats going the outside course, those above class J, was better than usual, the contestants keeping much nearer together. Ogeemah and Spots did especially well among the smaller craft.

At the finish Bonito had beaten Kangaroo 4m. 18s. Squaw beat Indian 7m. 5s.; Ogeemah beat Karma 3m. 33s.; Vagabond, 8m. 55s.; Spots beat Wraith 1m. 19s.; Rascal finished 1m. 5s. ahead of Martha M., 4m. 57s. ahead of Boozie. Jig-a-Jig beat Esperance 1m. 20s., Kelpie 3m. 4s., Vixen 4m. 12s., Quinque 6m. 30s., Stinger 12m. 45s.

The fourth regatta of the Yacht Racing Association of Gravesend Bay occurs on July 18 under the auspices of the Bensonhurst Y. C. The summaries of the race of June 27 follow:

A. C. A. Membership.

The following have applied for membership to the A. C. A.:

Eastern Division.—W. W. Morrison, Wm. A. Phinney, W. R. Bliss, G. H. Abbott, H. M. Colby, H. W. Spaulding, Don W. Osgood, W. R. Wescott, W. C.

Colby, R. D. Reed, Lester P. Horne, B. F. Welch, H. G. Clough, Clinton Phelps, F. L. Chase, Guy B. True, Manchester, N. H.; F. LeRoy Pratt, Winchester, Mass.; Harry Merriam, Edgar Frost, F. W. Biery, Jr., Wilfred Cyr, Joseph Prince, Earle Allen, Carl G. Weiss, H. L. Backus, E. A. Johnson, Wilbur Cross, Deane B. Small, Lawrence, Mass.; F. L. Angus, Alex. Ritchie, Andover, Mass.; Chas. G. Newcomb, Frank Gibbs, Ralph P. Hayes, E. L. Tufts, Jr., H. E. Boardman, Medford, Mass.; J. A. Garland, Somerville, Mass.; T. G. Beggs, Jr., F. J. Babcock, Woburn, Mass.; Harry L. Dadman, Worcester, Mass.; B. E. Phillips, Jr., Dedham, Mass.; Edwin T. Samuels, Hyde Park, Mass.; H. Willard Hiss, Baltimore, Md.; R. A. Garrison, Newton, Mass.

Atlantic Division.—Elmer B. Ayres.

American Canoe Association.

REGATTA PROGRAMME.

Sugar Island, St. Lawrence River, Aug. 7 to 22, 1903.

(Prescribed by Racing Regulations.)

RECORD RACES.

Event No. 1: Combined paddling and sailing record race; 3 miles; time limit 1½ hours; start to be made under paddle; ½ mile, alternately, paddling and sailing.
Event No. 2: Paddling record race; ½ mile straightaway.
Event No. 3: Sailing record race; 4½ miles; time limit 2½ hours.

Note.—The record races are governed by Rule VI. of the Racing Regulations.

SAILING RACES.

Event No. 4: A. C. A. trophy sailing race, 9 miles; time limit 3½ hours.

Event No. 5: Dolphin trophy sailing race, 7½ miles; time limit 3 hours.

Note.—By deed of gift the winner of the A. C. A. sailing trophy is debarrd from entry in the Dolphin trophy race.

Event No. 6: Deeked or open canoe sailing race, 6 miles; time limit, 2½ hours.

PADDLING RACES.

Event No. 7: A. C. A. trophy paddling race, 1 mile straightaway.

Event No. 8: One-man paddling race, single blades, ½ mile.

Event No. 9: One-man paddling race, double blades, ½ mile.

Event No. 10: Tandem paddling race, single blades, ½ mile.

Event No. 11: Tandem paddling race; double blades, ½ mile.

Event No. 12: Fours, paddling race; single blades, ½ mile.

Event No. 13: Fours, paddling race, double blades, ½ mile.

(Not Prescribed by Racing Regulations.)

SAILING RACES.

Event No. 14: Novice sailing race; 3 miles; time limit 1½ hours; open to men who have not sailed in canoe races prior to Sept. 1, 1902.

Event No. 15: Club sailing race, 2 miles to leeward (or windward) and return; to be won by the club that shall have first three canoes finish.

Event No. 16: Open canoe sailing race, 1½ miles.

Event No. 17: Cruising canoe sailing race, 3 miles; time limit 1½ hours.

Event No. 18: Special class sailing race.

Note.—Events Nos. 17 and 18 are governed by Rule I. of the Racing Regulations, and may be changed by the amendment of such rule.

PADDLING RACES.

Event No. 19: Novice paddling race, single (or double) blade, ½ mile. Open to men who have never raced at any general or division camp of the American Canoe Association.

Event No. 20: War canoe paddling race, 1 mile straightaway.

Event No. 21: Upset paddling race, ¼ mile.

Event No. 22: Gunwale paddling race; ¼ mile.

Event No. 23: Tail-end paddling race; ¼ mile.

SUNDRY RACES.

Event No. 24: Hurry-scurry race; run, swim and paddle, 300 yards.

Event No. 25: Tilting tournament.

Note.—In addition to the foregoing, there will be sailed the Elliott sailing trophy race, open only to members of the Atlantic Division; and there will also be sailed or paddled such other Division sailing or paddling trophy races as shall not have been sailed or paddled at the respective Division camps this year.

The Regatta Committee will start the minor races not later than Wednesday, Aug. 12, 1903, the middle of the first week of the annual camp, so as to insure the completion of the programme by the second week; camp closing Friday, Aug. 21. To that end all men are requested to be at camp in time for such races.

The Regatta Committee reserves the right to add to or change this programme at the annual camp by duly posted notice at headquarters.

The Regatta Committee calls attention to sundry proposed changes in the existing Racing Regulations, which will be published in complete and proper form in the official organs of the A. C. A., and voted on by the Executive Committee prior to the annual camp, as per Chapter XIII. of the By-Laws, and Rule XXIII. of the Racing Regulations.

Regatta Committee, 1903: C. E. Britton, Gananoque, Canada; H. C. Hoyt, Rochester, N. Y.; A. W. Friese, Milwaukee, Wis.; J. K. Hand, Chairman, Brooklyn, N. Y.

Rifle Range and Gallery.

Fixtures.

July 6-7.—New Haven, Conn.—South New England Schuetzen Bund annual schuetzenfest, under the auspices of the Independent German Rifle Company. H. C. Young, Sec'y.

International Revolver Match.

THE postponement of the International Revolver match, which was anticipated as a consequence to a delay in receiving the standard American target by the French team, was never in a material stage, as the targets were found and delivered in ample time.

The members of the French team are as follows: MM. Balme, Fouconnier, Lecoq, Louvier, P. Moreau and Sartori, of Paris; Capt. Moreau and Adj. Paroche, of Rennes; M. Laurette, of Ham; Comte de Castelbajac, of Libourné; Capt. Chauchat, of Versailles; M. Dutfoy, of Marseilles; M. Keller Dorian, of Lyons; M. Moline Paget, of Dieppe, and Commandant Py, of St. Omer.

Substitutes are M. Cazin, of Marseilles; M. Larroy, of Toulouse; M. De Passio, of Lyons, and MM. Feugray and Giralton, of Paris.

The tryouts at Walnut Hill on Friday and Saturday of last week resulted in a selection of a team and substitutes as follows: R. H. Sayre, who is now in Paris, and who has been permitted by the U. S. R. A. to shoot with the Frenchmen as a member of the American team; Oscar I. Olson, Duluth; B. F. Wilder, New York; J. A. Deitz, Jr., New York; E. E. Patridge, Boston; C. S. Axtell, Springfield; J. D. Humphrey, Boston; J. R. Calkins, Springfield; C. S. Bouve, Boston; William Amory, 2d, Boston; Thomas Anderson, Boston; W. A. Smith, Springfield; C. F. G. Armstrong, Boston; A. L. A. Himmelwright, New York; R. S. Hale, Boston; J. B. Crabtree, Springfield; Louis Bell, Boston; William N. Luckett, New York; A. R. Whittier, Boston. The American team shot on Tuesday of this week. Dr. Sayre, in Paris, was to shoot at the same time, in the Maison Lafitte Shooting Club, as his fellow members shot on this side.

Sergt. W. E. Petty, the champion revolver shot, owing to the exactions of his profession, will not be able to participate in the match, hence the team loses an eminently strong contestant.

Rifle at Shell Mound.

SAN FRANCISCO, June 22.—There was held at Shell Mound range yesterday a very interesting contest with revolvers. Ten picked men from the San Francisco Police Department were pitted against a similar number of men from the Golden Gate Club. The police used service weapons and their opponents target revolvers. The former were allowed 30 points handicap. The result was very close, and there will doubtless be a return match. Scores:

Golden Gate.	Police Team.
J. E. Gorman.....48 47	Smith Carr.....45 49

P. C. Becker.....47 48—929	J. A. Hayes.....44 45 + 30

The Turner Schuetzens held an open shoot, 25-ring target, four shots to a ticket, cash prizes. Scores: A. Strecker 94, O. Bremer 92, F. P. Schuster 91, H. Windmuller 91, C. Peach 91, M. F. Blasse 90, H. Enge 87, J. Schaub 87, H. Schennart 87, G. H. Bahrs 86, H. Huber 86, J. Howerwass 86, A. Jungblut 86, M. Kohlender 86, F. Mante 84, W. Ehrenpfort 81, A. Schleuter 80, F. E. Mason 79, F. Attmyer 78, G. F. White 73, F. Hausman 69, Capt. L. Siebe 44.

A New Army Rifle

THE daily press recounts that the Government has approved and adopted the new improved magazine rifle, which has been under test for a year past. Orders have also been issued by Gen. Crozier to the officers on duty at the Springfield Arsenal to complete arrangements as soon as possible for the work of manufacturing the new gun.

The new rifle is to have a barrel 24in. long, a compromise length between the 30in. infantry arm and the 22in. cavalry carbine. One of the features is the use of a rod bayonet in place of the sword bayonet. Both the infantry board at Fort Leavenworth and the cavalry board at Fort Riley approved the new rifle. The Navy also will be equipped with the new rifle, so that the same kind of ammunition can be used in both services.

There are seven countries formally committed to competition for the Palma trophy, namely, the United States, Great Britain, France, Norway, Canada, Australia and Natal. Switzerland and Rhodesia are possible contestants.

Henry Oliver Peabody, famous as the inventor of the Peabody rifle, died at Point Allerton, Mass., June 28, in his seventy-seventh year.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

- July 14-16.—The Americus, Ga., second annual interstate target tournament. H. S. McCleskey, Sec'y.
- July 15.—Charlottesville, Va.—Shoot of the University of Virginia. G. L. Bruffey, Sec'y.
- July 18.—Chicago, Ill., Gun Club's tournament. A. A. Walters, Sec'y.
- July 20-22.—Winnipeg, Can.—Seventh annual trapshooting tournament of the Winnipeg Industrial Exhibition Association. F. W. Heubach, Gen'l Mgr.
- *July 21-22.—Beaver Falls, Pa., Gun Club's tournament. W. R. Keefer, Sec'y.
- July 30-Aug. 1.—La Crosse, Wis.—The Interstate Association's tournament, under the auspices of the La Crosse and Viroqua gun clubs. John M. Moore, Sec'y.
- *Aug. 5-6.—Brownsville, Pa., Rod and Gun Club's tournament.
- Aug. 12-13.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selember, Sec'y.
- Aug. 12-15.—Toronto, Ont.—Annual tournament of the Dominion Trapshooting and Game Protective Association. A. W. Throop, Sec'y-Treas., Ottawa, Can.
- Aug. 18-20.—Grand Rapids, Mich.—Second annual target tournament of the Consolidated Sportsmen's Association of Grand Rapids; \$1,000 added. A. B. Richmond, Sec'y.
- Aug. 19-20.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selember, Sec'y.
- *Aug. 19-20.—Millvale, Pa., Gun Club's tournament. Wm. Bussler, Sec'y.
- Aug. 26-27.—New Bethlehem, Pa.—Crescent Gun Club's annual tournament. Dr. R. E. Dinger, Mgr.
- Aug. 25-28.—Lake Okoboji, Ia.—Annual Indian tournament. Frank C. Riehl, Chief Scribe.
- *Sept. 1-2.—Irwin, Pa., Gun Club's tournament. John Withero, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The next shoot of the Hudson Gun Club, Jersey City, N. J., will be held on July 12.

The Fairview Gun Club, of New Jersey, held its opening shoot on Saturday of last week, on its grounds, near Englewood.

When a wealthy man shoots badly, he is not in his usual good form. When a poor man shoots badly he is a poor shot, present, past and future.

A new gun club has been organized at Binghamton, N. Y., with a large and influential membership. They are actively purposeful in trapshooting matters.

In the contest for four-man teams at Allegheny, Pa., June 25, the Milvale Gun Club won, defeating the North Side Gun Club's team by a score of 177 to 170.

The Garfield Gun Club, of Chicago, Ill., announces a shoot for July 4, to which it invites shooters. The secretary is Dr. J. W. Meek, 182 Park avenue.

From a press clipping we learn that the Vicksburg Gun Club will be represented at Memphis by Messrs. Hayes, Miller, Hossley, Henry, Fletcher, Pinkston, Bradfield, Adams and Dinkins.

The matter of professionalism, as it concerns the New York State shoot, is brought forward for discussion elsewhere in our trap columns, by an eminent leader in trapshooting affairs.

Mr. J. L. D. Morrison, one of the leading experts in trapshooting, either at live birds or targets, arrived in New York on Wednesday of last week, where he will visit during three weeks more or less.

The Middletown, N. Y., Gun Club have fixed on July 4 for an open shoot. Shooting will commence at 1 o'clock. There are seven programme events, 10, 15 and 20 targets. Moneys divided 50, 30 and 20 per cent.

The secretary-manager, Mr. Elmer E. Shaner, writes us that "the closing tournament of the Interstate Association series for the season of 1903 will be held at Scranton, Pa., Sept. 23 and 24, under the auspices of the Scranton Rod and Gun Club."

Mr. John S. Wright, manager of the Brooklyn, N. Y., Gun Club, informs us that if the weather is pleasant, he will hold a shoot on Saturday of this week on his club's new grounds, at the terminus of the Kings County Elevated, nearby his old grounds.

July 4 has been fixed upon to hold a number of shoots, club and individual, many of which will be embellished with lost eyes, flying fingers, smashed legs, and some cases of lockjaw. Thus is the day observed in good spirit and brightened and consecrated.

At the Interstate shoot held at Rutherford, N. J., on Wednesday and Thursday of last week, the three high men for the two days, at a total of 360 targets, were as follows: First, W. R. Crosby, 351; second, J. A. R. Elliott, 344; third, E. C. Griffith, 339.

Mr. J. Hildreth, one of the leading representatives in the ammunition trade, is in New York at present, his return being due to a sad cause, the death of his father. Mr. Hildreth, Sr., had lived to a good old age, seventy-nine, a length which nature vouchsafes to but few.

Mr. A. A. Schoverling, manager, informs us that the Richmond Gun Club will hold an all-day target shoot on July 4 at Concord, Staten Island. The special event is at 100 targets, entrance \$2, for a \$10 gold piece. Targets one cent. Ten valuable prizes will be for competition.

Mr. Fred Gilbert was high for the two days' programme average, June 25-26, at Fort Dodge, Ia. He broke 153 out of 160 on the first day, and 184 out of 185 on the second day, a total of 337 out of 345, nearly a 98 per cent. gait. Budd and Taylor tied on 156 on the first day, and 178 on the second day.

In the third trophy shoot of the Garfield Gun Club, Chicago, Ill., June 27, twenty-one contestants, Messrs. T. W. Eaton and N. H. Ford tied on 24 out of 25 in Class A; Mr. Fred Wolff won Class B with a score of 23; and Mr. Snyder won Class C with 20. Mr. Ford also won the cup in the event at 15 singles and 5 pairs, making the excellent score of 21.

The secretary, Mr. A. Burwell, Jr., writes us as follows: "This is to advise that the Charlotte, N. C., Gun Club will hold a two-days' shoot at targets on July 28 and 29, with \$100 per day added money. We anticipate the largest attendance ever had at a similar shoot in the South. Inquiries directed to the president, Mr. J. E. Crayton, or the secretary, Mr. A. Burwell, Jr., will have prompt attention. Programmes will be forwarded within ten days."

The Chicago, Ill., Gun Club announces a tournament, to be held at Seventh-ninth street and Vincennes Road. The competition is open to all amateurs. No handicaps. Professionals may show their goods and shoot for targets only. Targets 2 cents. Moneys divided, 50, 30 and 20 per cent. Shooting commences at 10 o'clock. The programme contains fourteen events, 10 and 15 targets, entrance \$1 and \$1.50, \$2 and \$3 added. For further information address the secretary, A. A. Walters, Union Stock Yards.

The Mt. Kisco, N. Y., Gun Club has fixed upon July 3 and 4 for its fifth annual tournament. There are ten events each day, at 15, 20 and 25 targets; a total of 175 targets, with a total entrance of \$14. Shooting commences at 10 o'clock. Targets, 2 cents. No. 8, first day, is a handicap at 20 targets. On the second day No. 5 is a handicap; No. 6 is for the Turner trophy, and No. 7, 20 targets, is a merchandise event, which Mr. A. Betti, the manager, assures us, will have prizes to the value of \$150. Band concert in the evening.

A correspondent writes us that "a one-day tournament, under the joint auspices of the Providence and Aquidneck gun clubs will be held on the grounds of the latter, at Newport, R. I., on July 22. The programme events will be alternately 15 and 20 targets, 175 in all. In average prizes, \$35 will be given, beside a number of merchandise prizes. Programmes may be obtained on application to R. C. Root, 33 Weybosset street, Providence, or J. C. Coggeshall, 32 Church street, Newport, R. I."

July 3 and 4 are days foreordained to shooting activity at Memphis, Tenn., for in that famous city on those dates will be held the twelfth amateur target tournament of the Mississippi Valley 'Trapshooters' Association, under the auspices of the Memphis Gun Club. July 2 will be a preliminary day. Three valuable trophies for averages and \$400 added money are offered. There are ten programme events each day, two at 15, six at 20 and two at 25 targets; entrance based on 10 cents per target, and added money \$1 per target; thus the added money is \$15, \$20 and \$25 in the different events. Events 6 and 7, 25 targets each, first day, constitute the Fabacher trophy, open to League members only, though open to all amateurs in the sweeps. On the second day No. 5, 25 targets, is the Peters Cartridge trophy event, open to all amateurs. Event 8 is the League three-man team race for Peters trophy. For high averages, beautiful and valuable trophies, donated by Messrs. C. L. Byrd & Co. and Geo. T. Brodnax. A letter to us from a gentleman whose information is both accurate and full, relates the following: "Trapshooting is unusually active in Memphis just now, and this promises to be our most successful season since '98. The two clubs are doing what we might term 'a big business,' as twice a week there are from twenty to thirty shooters on the grounds, who spend their afternoons in friendly rivalry at the traps. The tournament promises to be largely attended. All of the surrounding States will send large delegations, and if there are not seventy to seventy-five shooters present, we will be greatly 'disappointed.'" Southern hospitality is of world-wide fame as the pinnacle, and those who visit Memphis are assured of a good tournament and good fellowship. Mr. A. H. Frank is the secretary.

BERNARD WATERS.

Trap at Allentown.

ALLENTOWN, Pa., June 26.—At the Duck Farm Hotel, a joint shoot of the J. F. Weiler Gun Club and the Allentown Rod and Gun Club was held. The famous trapshooters Messrs. J. A. R. Elliott, W. R. Crosby and E. D. Fulford were present, and they performed in their usual high degree of excellence. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
Targets:	10	10	10	10	10	10	10	10	10	10	10	10	10	10	10	10	10	10

M. V. T. S. and G. P. A.

Mr. J. J. BRADFIELD, secretary of the Mississippi Valley Trapshooters' and Game Protective Association, Vicksburg, Miss., has issued a circular letter to the shooters in the States of Mississippi, Louisiana, Tennessee and Alabama. The following is a copy of it: Vicksburg, Miss., June 23, 1903.—Dear Sirs and Brother Sportsmen of the South: At a meeting of the Mississippi Valley Trapshooters' and Game Protective Association, held at Shreveport, La., the name of our Association was changed to the Southern Trapshooters', Game and Fish Protective Association, and it was decided at this meeting that we take steps for the protection of our game and fish in the States of Mississippi, Louisiana, Tennessee and Alabama, enforcing the laws of those States which have good game laws, and to make laws for those States which have none. The meeting was an enthusiastic one, and the protection of our game and fish was freely discussed, and it was agreed that the matter be taken up and pushed at a meeting to be held during the Memphis Gun Club tournament, July 3 and 4, 1903. This meeting will be held in the parlors of the Gayoso Hotel on the evening of July 3, and it is urged that every gun club, members of our Association, and any gun club or game protective association in the South which wishes to join our Association for the protection of our game and fish, have a representative present at this meeting. Something must be done in the above States for the protection of our game and fish, and it must be done at once. We invite all gun clubs or game protective associations in the South to join our Association, the membership fee is low (\$2.50 per year), and if we get together we can stop the wholesale slaughter of our game, which is fast diminishing. Send in your applications for membership or put them in at Memphis on July 3, and let's join hands in this matter, which is of the greatest interest to every lover of the gun and dog in the South. All clubs that are members of our Association should by all means have a representative present. The Memphis shoot will be the twelfth tournament given by our Association, and we can well feel proud of our success. No organization so young or older, has the record that our Association enjoys, as we have pulled off eleven of the largest tournaments ever given in the United States. Abe Frank, secretary of the Memphis Gun Club, promises all a fine time on July 3 and 4, and Abe can be depended on.

W. P. T. L. at New Castle.

NEW CASTLE, Pa., June 27.—The eighth tournament of the Western Pennsylvania League of Trapshooters was held in New Castle, Pa., June 24 and 25. The attendance the first day was fair, and not quite so good the second. From the location of New Castle, it was expected that the banner shoot of the season would be pulled off, as the town is easy of access for nearly all the clubs in the League, while quite a number of more or less expert shooters, who live north and west of the place, and within a few hours' ride, were expected to attend; but for some reason did not.

Loyal old Youngstown, O., sent her quota, and some of Sharon's experts drifted in about noon of the second day; but Erie, Cambridge Springs, Greenville, Titusville, Oil City and Meadville failed to send a man. Can it be possible that we are getting too swift for these inland village shooters? Perhaps it was too long after pay day.

Papa McNary, of Greenville, with his cheerful, wrinkled old face, was not present, and great was the disappointment among his many friends. It is the first shoot he has missed for years, and the thought as expressed by one of his old friends, that "I'm afeared the old feller is all in as a shooter," found echo in the hearts of many. The Sharon boys say, however, that it's nothing of the kind; he couldn't come because his town was holding a big celebration in honor of his seventy-eighth birthday.

Tuesday evening Ed Rike's coat drifted into town. When it was unwrapped, Harry Watson, of Sewickley, the "Boy Wonder," stepped out. During the shoot he kept up his reputation as the "wonder" all right, being a very close second for high average each day. Jim Denny, of Ligonier, with his giant nephew, Tom Aseum, came in Tuesday night. Jim plays golf better than he shoots. He raised a shout of laughter when he stepped up to the score in the first event and, instead of calling "pull," yelled "fore!" This so surprised Chester Devonde Klingensmith, the trap puller, who is not up in golf lore, that he forgot to allow the lever to fall back, and in a moment the air was full of flying rocks; Jim banged into the flock, and the referee called, "Lost" in a matter-of-fact voice, that left no hope of a chance for a protest. The puller, with an indignant glance at Denny, turned to the writer and said: "I think, b'gosh, he'd better practice on one at a time instead of four!"

The weather conditions were favorable; bright, sunny, with a little wind, not enough to hurt. The trap "bucked" as usual, and always at a time when we were due to get 'em all, and a great many birds were "dusted hard," and one could frequently hear the statement that "for some unaccountable reason I 'finched' on that last bird," etc., etc. Now the truth of the matter is, at any and all shoots—especially where the contest is close—that mysterious "yellow" which the boys speak about gets up, and somehow is mighty hard to swallow; but we hunt for any kind of an excuse, and know in our souls we are lying when we make it, and we know the other fellow is lying too, and he knows we know it, and yet there is a strange fascination about the game, too. The hope that "springs eternal in the human breast" is with us that some day we will get them all, and have our names coupled once at least with such champions as Heikes, Crosby, Gilbert, Farmer Moore and Elliott.

The trade was represented by Messrs. Squier, Grubb, Sergeant, Stevens and Lawrence. The squad hustlers were Grubb, Lawrence and Sergeant, and very well they acted the part, keeping the shooters promptly to the score. Lawrence and Sergeant appeared in a new role, that of singers. They have a beautiful duet which they render with marked effect. It is said they sing better than they shoot, but as they didn't shoot any, it is hard to arrive at a conclusion as to how well they can sing.

A rather mean trick was played on Charley Grubb; he had been telling the crowd about some wonderfully large and venomous snakes he had killed at various times. Some one found and killed a small garter snake; this was placed in a shell box and covered with field flowers. Lawrence presented the box to him with a few well chosen remarks, telling him that it was a slight token of the esteem in which the assembled shooters held him as a brave and fearless snake killer. Grubb received it with one of his Chesterfieldian bows, and proceeded to open it. When he saw the small snake coiled up in the box he dropped it like a flash, and springing two or three feet in the air, gave vent to a yell of terror so loud that it startled some sheep in an adjoining field, and sent them off on a wild, aimless run. So fierce was it that Frank Snow, who was on the firing line, called "Pul-l-l!" before he was ready. Silent Jimmy Atkinson lost his reputation for being "silent." The cause of it all was this: The man who was to furnish the lunch sent one of his employes up about 11 o'clock with a statement that he would be unable to furnish anything to eat that day. Then Jimmy broke loose. Jimmy, you must know, was general manager of the shoot. He may be a Christian, but his language on this occasion wouldn't indicate that he was. When he got through, some one sniffed the air and asked who was shooting Jack Fanning's Gold Dust powder. Atkinson won high average the first day and tied Hickey for it the second day. Watson was second both days. Fleming and Shaner tied for third on the first day, and Snow was third on second day. The Milvale team won first in the cup race; North Side second. The following scores were made, each contestant shooting at 50 rocks. For Milvale: Hickey 49, Lutz 47, Bess 40, Ray 41; total 177. For North Side: Fleming 45, Kelsey 43, Watson 44, Andrews 38; total 170.

The club's president, E. I. Agnew, acted as official scorer, and Will J. Harlan was referee. Both gave perfect satisfaction. The score follows:

First Day, June 24.

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	15	20	15	20	15	20	15	20	15	20

HENRY P. SHANER.

IN NEW JERSEY.

North River Gun Club.

Edgewater, N. J., June 20.—The North River Gun Club held a Wanderers' shoot to-day. The main event was the contest for the L. C. Smith gun, donated by Mr. E. Banks and recently won by him at the New York State shoot. The conditions governing competition for it are as follows:

To be shot for by the Wanderers. Eight shoots on eight separate days at 25 targets per man, handicap allowance of misses as breaks; entrance price of the targets only; entrance fee to go to the club on whose grounds each separate competition takes place; four best scores to count. Each member of the Wanderers will receive ample notice of each succeeding competition. All competitions will be held within easy reach of New York city, in order that all members of the Wanderers may have an equal chance to win the prize.

There were eight Wanderers present, namely: Messrs. Floyd, Apgar, Engle, Herrington, Goetter, Banks and Dr. Gardiner.

Events:	1	2	3	4	5	6	7
Targets:	15	20	15	20	15	20	15
Dr. Gardiner	12	12	10	14
Dudley	14	18	14	15
Eickhoff	10	14	4	16	5	11	..
Morrison	12	12	10	13

JAMES R. MERRILL, Sec'y.

Hell Gate Gun Club.

June 23.—The Hell Gate Gun Club held its June shoot on Tuesday of last week at Outwater's grounds, near Carlstadt, N. J. There were twenty-two entries, and of these Mr. L. H. Schortmeier was the only one in the club event at 10 birds to kill straight. The scores follow:

Schorty	30	7	2222222222	10
Col J. H. Voss	30	7	2021002222	7
Dr. Davis	26	5½	1100*20021	5
Von Valkenberg	28	6½	1200200*02	4
Meckel	28	6	111101121	9
Schlicht	28	6	1012111120	8
Breit	28	5½	0000100211	4
Belden	28	6	1221012020	7
Woefel	28	6	10*2221022	7
Foster	28	7	0211222211	9

MOSQUITOES AND MUSIC.

A CHARMED life has the mosquito, and a merry one, too, if one may justly believe that his cheerful war song is an index of constant merriment when he is in man-eating activity. He, or rather she—for it is the female which is so insatiably bloodthirsty—is a bold, brazen creature, be she ever so tuneful when seeking sustenance. She is one of the few forms of the earth's creatures which have steadfastly ignored and violated the principle of law that a man's house is his castle. Indeed, the mosquito has not scrupled to treat his person as lawful and proper prey on opportunity. From time immemorial she has sought his blood at sight. Hence the ancient feud, unceasing, implacable, with the mosquito on the one hand ever in the role of aggressive invader, and poor man, on the other hand, in the role of defender behind his ramparts of dopes, mosquito bars, window screens, volatile oils, and smudges, or helpless in open battle, man against mosquito.

Within a comparatively recent period, man has taken new heart in the unequal warfare. By patient investigation he has learned that, in theory, at least, mosquitoes may be destroyed as a whole, instead of in detail, after the manner of the old-fashioned slap.

Last year the mosquito's extermination was proclaimed by virtue of crude coal oil; or, rather, the larvæ and pupæ, the innocent mites of mosquito infancy, were to be smothered by crude coal oil, applied in sufficient quantity to form a film over the mosquito breeding grounds, the stagnant waters of pools, of swamps and marshes, thereby accomplishing a complete race suicide at one stroke, as it were. Though effective, this method had some special disadvantages, chief of which was its costliness. It could be used only by wealthy communities. Any proposition to entirely exterminate the mosquito by the use of oil would of necessity involve certain general questions as to how many thousands of square miles of stagnant water there were in North and South America, and how many train loads of crude oil were obtainable; and then there was the particular question as to how oil and water were to be brought together. Nevertheless death by coal oil was the decree against the mosquito in 1902.

But patient investigation and experimentation have discovered newer and more economical methods. A more painful extermination has been devised, of which the following is a description:

"Practical application has been given the new system, and it has been discovered that a certain musical note raised to a great number of vibrations per second will cause the mosquito to experience sudden and complete paralysis, and not only does this intensified note arrest the insect in flight or hurl it from the ceiling or wall, but also because of a strange construction of the mosquito's auditory system, it causes it to plunge undeviatingly toward the spot whence the music issues.

"It has been found that the practical application has been effected by raising to a great number of vibrations per second the particular note to which the mosquito is most sensitively attuned. This intensified note was produced by sudden electrical impulse upon a musical instrument, whereupon it was noticed that every mosquito in the room had plunged headlong to the instrument, and that when the windows were opened the room was soon filled. Again the amplified note was sounded, and instantly in a cloud the mosquitoes, apparently lifeless, were precipitated against the apparatus."

It will be observed that this latest method deals with the adult mosquito, and therefore is much fairer than the making of war on the mosquitoes' immature offspring. It, too, bears the earmarks of entire efficiency, if our own experience and that of others in the correlated effects of sounds are to be accepted as pertinent data.

Is there anyone who has not dear friends, both male and female, who, in moments of emotional happiness, have broken forth into raucous song having many notes of different degrees of malignancy and harmfulness, some maddening, others paralyzing, stupefying or blasting?

Who has not seen the charming vaudeville performer, tripping forward to the footlights airily, smilingly, in an atmosphere of wondrous sweetness, and then heard her emit notes successively wearisome to the soul and debilitating to the body?

Cats, on the back fence, at the gruesome midnight hour, have been known to strike notes which, owing to the strange construction of the bootjack's auditory system,

have caused it "to plunge undeviatingly toward the spot whence the note issues."

Indeed, the dirgeful chant of a solitary mosquito in one's bedroom at the hour when sleep impends, is alarming and destructive to rest. The delicate crescendo and diminuendo buzzing, denoting predatory advances and strategic retreats, profoundly affects mind and body of the listener. Thus the idea of shocking to death by a peculiar note is old. Recourse to it for the annihilation of the mosquito is simply the application of an old thing in a new way.

But the remedy is fraught with perils. If the blasting note shall be permanently added to the many false notes, or notes which are neither false nor true, now possessed by the human race, the mosquito plague may be only a trifle in comparison. But we have an abiding faith in the permanency of the mosquito as a fact, and in the efficiency of the destructive note as an idea, and of ideas there are many kinds, some wise, some otherwise.

AFTER THE FOURTH.

JULY 4 for 1903 has been duly observed and solemnized by a record-breaking consumption of fireworks, and the incidental demoniacal hullabaloo raised by small boys and large boys, and young boys and old boys, the latter, as a rule, being quite frolicsomenely giddy in the use of explosives, as becomes men who rejoice by means of boyish methods. Indeed, in their interpretation of the true way to express patriotic rejoicing by means of explosives, the old boys of 60 or 70 winters or less are oftentimes more giddy than the small boy of six or seven springtimes or more.

As a rule, July 4 lost much of its associational distinctiveness, for the reason that the firecracker, torpedo, and toy pistol phases of it were put into action early in June, indicating that the boyish craving to use firearms is a manifestation in itself, existing independently of any day or any associations. While the hullabaloo, which in a way has been sanctioned by usage, may be tolerated on July 4, when begun and continued days before and after, it has no patriotic significance, and is more in the catalogue of public nuisances than in the category of patriotism. For the sake of peace and safety, so great is the 4th of July season on the border line of public nuisance, many good people journey countryward from the cities to escape the din, the stench of burning crackers, and the danger of bullets flying at random.

In all our large cities and their environs last Saturday, a day of about 36 hours if measured by din and swirl, was particularly strenuous in emphasizing America's greatest day. There was the customary large and patriotic contribution of maimings by explosion; of people killed by bullets fired by unknown hands; of inoculations of lockjaw germs caused by the toy pistol in the hands of the small boy, so-called; of houses lost by fires and invalids tortured by the incessant racket. Thus was attained a high-water mark of true patriotism, a realistic reproduction, in a way, in times of peace of the happenings of our forefathers in the actual war of the Revolution. In New York city alone the police records up to midnight of July 5 had mention of 122 accident cases, most of which were caused by stray bullets, and of 75 fires. Bellevue Hospital treated 57 accident cases, and Roosevelt Hospital treated 118 accident cases. Many men were arrested for discharging loaded revolvers.

Some incidents of the day are worthy of enumeration. The shops of the Manhattan Elevated Railroad Company were burned, the estimated loss being \$150,000. The newspaper reports state: "The only cause suggested for the fire is that rockets may have been shot through the open skylights." Long Island presented some warlike realism. The account follows: A 360-pound cannon exploded this noon at East Moriches, and Theodore King, 17 years old, one of the boys who was firing it, may lose the sight of his right eye, besides being badly burned and having a hole torn through his nose.

At Larchmont, N. Y., a burning balloon fell on the rectory of St. John's Protestant Episcopal Church, setting fire to it, and the church was saved only by the brave efforts of members of the Larchmont Yacht Club. The list could be indefinitely extended. The aggregate of maiming, injury and loss of property throughout the United States undoubtedly reaches vast dimensions.

Patriotism is to be encouraged and cherished. But there is something radically wrong with its manner of expression when bullets are fired promiscuously and recklessly in our cities, large and small; when giant crackers of terrific power are freely within the reach of the ignorant, the malicious and the reckless; when the toy pistol, so deadly as the cause of lockjaw, is allowed in common use. The day should be one of pleasure, thankfulness and rejoicing to all, instead of a menace or a nuisance as now observed. Patriotism is primarily a love for and a devotion to one's country, and love and devotion are not expressed by violence and death.

FISHING RIGHTS.

WE print on another page the full text of the opinion of the Appellate Division in the suit brought by William Rockefeller against Oliver Lamora for fishing trespass on the Rockefeller preserve in the Adirondacks. The case is one of much importance, because the several decisions of the lower courts, in favor of Lamora, have been quite generally interpreted by the press of the State as establishing the principle that action for trespass damages could not be maintained as to waters stocked by the State. Such an interpretation, we pointed out at the time, was hasty and erroneous; and that it was so is now shown by this adjudication by the Appellate Division. In the new trial, which has been granted, the defense heretofore offered by the defendant will no longer be available, and a verdict against him for trespass will no doubt follow.

For, after all, divested of popular sympathies and prejudices, the Rockefeller-Lamora action is nothing more nor less than an ordinary suit for fishing trespass. The parties to it happen to be a multi-millionaire and a poor man; but the principles involved are those which would govern as to a half-mile trout stream on any farm posted in accordance with section 212 of the game law. The owner or lessee of the land possesses the exclusive right to fish in the water flowing through it, and he has this right whether he be the owner of one acre or of 50,000 acres. A Lamora has no more right to fish without leave on the property of a Rockefeller than a Rockefeller has to fish on the property of a Lamora.

The opinion is so full and explicit on these points that it should have careful reading; there is altogether too much popular confusion respecting this question of fishing and shooting rights, and the exposition here given in this Rockefeller-Lamora opinion will do much to clear away the cobwebs.

As to the contention that the Rockefeller preserve waters had been stocked by the State and in consequence were open to the public, the evidence adduced went to show that no such stocking had been done with consent of the owner. The stocking had been done evidently by planting fish in waters whence, in the course of nature, they might pass into the waters of the preserve. The law which formerly provided that waters stocked by the State should be open to the public has been repealed; and the substituted law reads:

But waters stocked with fish by the State at any time after April 17, 1896, shall not be laid out in any such park. If waters in any such park are hereafter stocked by the State with the consent of the owner the provisions of this article shall no longer apply thereto.

That is to say, the owner of the waters may no longer sue for the exemplary damages of \$25 in addition to the actual damage. Thus to provide that special trespass damage may not be collected is a proposition very different from the old provision that waters should be open to the public. The new reading leaves the right of the owner precisely as it would be without the operation of any special parking law. That right is of the exclusive possession and use of one's property. The farmer's exclusive right to fish in his meadow brook is a right as clearly, definitely and inalienably vested as is his exclusive right to mow the meadow hay. This is a common law right, and may be invaded neither by individual trespasser nor by legislative statute without due recompense.

If this be so, we shall look with interest for the practical operation of the new Colorado law, which reads: "Provided, That the public shall have the right to fish in any stream in this State stocked at public expense, subject to actions in trespass for any damage done property along the bank of any such stream."

The Sportsman Tourist.

Feeling Pleasant Under Difficulties.

"OH, YAIZ! oh, yaiz, oh, yaiz! Kape shtill every mother's son of yez, the Coort is upon the Binch." I give it as I once heard it in a Tammany Court in New York, and do not undertake to translate into English the call as given out a few moments ago by a Scandinavian descendant of Eric the Red.

And here I am in court through and by virtue of a small piece of paper known as a jury summons. The clerk has repeatedly dipped his hand into the wheel of fortune, but so far my name has slipped through his fingers. The jury is made up and I sit and await my fate, called, but not yet chosen. I do not feel pleasant. My desk is covered with papers demanding attention, and if this thing lasts for a week or two I must turn day into night. But what's the use! I find a paper in my pocket and a lead pencil. I appropriate a chair in a sunny corner of the courtroom by an open window, and, using my straw hat and knees for a desk, I try to write myself into green fields, on rippling waters, and among sweet smelling pines.

I imagine myself up in Maine at the Carry Ponds. It is my first trip into the Maine woods, and twenty years ago. As we walk along the trail toward Chester's camp I notice the absence of bird life and music. The flitting of a red-headed woodpecker across our path, to disappear in the shadow of the trees, attracts our attention. The discordant cry of the jay is a relief to our ears heretofore drinking in the stillness. The chattering cry of the trout-thief faintly heard in the distance, accompanied by the weird laugh of the loon, warns us that the lake is not far off. Not many more minutes of tramping brings us to an opening in the woods and ahead of us we see the silvery expanse of the first Carry Pond.

And here is the camp and there is the lake! There is a smell of balsam boughs about the camp that pervades and subdues all other woodland odors and yet, above it all, from the nearby kitchen, comes a smell of frying salt pork and trout, as Chester, be-aproned and bare-armed, deftly turns them in the pan lest they brown too much.

Between the rapidly boiling coffee, the baking biscuit and beans and frying trout, Chester's hands are full, but he has time to ask us if we will not try the trout with fly and rod after we try them with knife and fork.

The wind is balmy and the ripple on the water is of the right kind to bring the trout to the surface and hide what is going on with rod and line between water and sky. And before the dinner-horn is blown we find time to get out our impedimenta and prepare for the evening's sport. We need no second blowing of Gabriel's horn, and take our seats around a trout and bean and biscuit laden table as only a good camp cook can spread.

Why go into a comparison between Fulton-Market-cooked trout and those that were piled up like cordwood on a large tin platter in front of us!

There is a commotion in the court. My corner is remote from both bench and attorney's table, and only now and then, when the legal battle has raged fiercely, have I heard the stereotyped, "I object! Immateral, irrelevant, and not in accordance with the pleadings in the case," tailed on to it from the bench "Objection sustained," or "overruled," as the case might be.

In fact, I have been lost in the woods, and have, with my pencil, cleared the atmosphere and have been oblivious to all immediate surroundings.

The jury in the previous case has been dismissed. They are calling a new one. My name is called and I must now forget all about pleasanter ways and waters and concentrate my mind upon the troubles of this world, for the time being, condensed in the persons of the plaintiff and defendant. I stuff my papers in my pocket, and, hat in hand, take my seat.

A ten minutes recess has been ordered by the judge to enable the plaintiff, a Swede farmer, who is pleading his own case, and who most certainly "has a fool for a client," to gather in, by endosmosis or induction, a few points on court procedure.

It is a "horse case"—not of the David Harum type, unfortunately—but a case where a slick Swede farmer evolves a plan to break in a pair of \$25 broncos by loaning them to a milkman, and the excitement of the streets of the village of Minneapolis being too strenuous, one of the horses dies and the other founders. This breaking-in process must have been a valuable one, for the dead bronco and the foundered one became each worth, for lawsuit purposes, \$200. The jury was on the verge of hysterics. Ole, once farmer now turned lawyer, was not one to accept a pig in a poke as far as the jury was concerned. He started in to find out a thing or two: Did the jury know the defendants? Were they acquainted with any customers of the defendants? Did the jury know any of their relations? Did the jury know anybody in Minneapolis? And the jury individually and collectively replied to Ole as best it could, and was accepted.

Then Ole opened his case by summing it up and demanding justice of the jury until the court called him to order. Then, as his own witness, Ole took the stand, and on a question of some horse medicine the jury, from Ole's testimony, was in a maze as to whether the defendants took the aconite and belladonna or whether it was given to the horse. As the horse died, and not the defendants, it was presumed that the horse got it. The jury and audience were in an uproar and at the close of Ole's testimony the court ordered this recess, and Ole is hunting for a lawyer to plead his case. He has dug up one from somewhere, the judge is back in court, the jury are meandering back into the box, so this tale of the Carry Ponds must come to an inglorious close, and instead of enjoying those trout and my evening's fishing all over again, I must listen and decide between fact and fiction.

The case is heard and decided. Ole and his friends told their stories, truly or falsely, under oath, and we have endured the harangue of counsel, who have made up in sound what they lacked in sense.

As foreman of the jury it was my sad duty to find with the others against Ole, and here I am waiting again the

pleasure of the judge with more time hanging heavily on my hands.

Well, Chester's trout disposed of and our pipes lighted, Chester left the care of the camp to his understudy, and as the sun was fast descending toward the horizon and sending long shadows upon the glassy surface of the lake, we were well on our way for the sunken and trout-haunted rock.

The lake reflected the clouds in the heavens above which blended with the pines and maples shadowed upon the surface of the water along the edge of the lake.

Presently a faint breeze sprang up, rippling the surface of the water. We are within sight of the sunken rock and see its black and slippery surface below the water line. We look to our flies and rods, and as Chester brings the boat broadside to the rock we make a cast. A splash, a strike, and with several quick, staccato screeches of the reel the line runs out as the trout makes for the bottom. The fish does not work in straight or zigzag lines, but as it descends keeps the line cutting through the water in a circle, much like the circular saw proceedings that a sunfish will carry on after he has taken a fly. After experimenting and failing to raise the trout from the bottom, Chester volunteers the statement that I have struck either a large sunfish or hooked the trout foully, and time proves the latter to be correct. My trout was hooked in the belly.

The trout are feeding well. The sun has now sunk behind the trees and the moon is lighting up the water with its uncertain light. We have fished deliberately and slowly, and have hurried no trout after he was hooked. We continue casting by the light of the moon, and the trout yet take the fly. We enjoy the evening and the uncertainty of the casts. We strike by intuition and fail frequently to set the hook. We do not always land the fish after they have been hooked. There comes a lull. The trout will rise no more to-night.

We turn slowly toward camp and drink in the scenery around us. The dancing of the moonbeams upon the restless surface of the lake and the deep encircling shadows on the shores, the shining stars overhead, and the stillness of the night broken only by the splash! splash! of the resisting water against the bow of the boat, are enjoyed in their fullness by us.

The lantern of the camp comes into sight as we round the point, and it is but a moment before we are stretched upon the balsam boughs, wrapped in our blankets and dreaming only such dreams as St. Peter, the fisher of men, sends to a contented fisherman.

And yet no sign comes from the judge that we are excused for the day. From the other side of the room I catch the long and weary cross examination of an unwilling and rebellious witness. I smell the balsam boughs and yet listen to the hum of life going on in the streets below. I find myself nodding and I resist the advances of Morpheus, for, while I have never heard myself snore, yet from abundant evidence and a sore spot or two (such as a sharp, feminine elbow might produce) in my ribs, I have reason to believe that I do snore when I sleep, and because of that I keep awake. I would fain now sleep were I sure I would not snore. So, like the Wandering Jew, I must hie on—with my story.

It was at Carrytunk up near the forks of the Kennebec. Pleasant Pond, remarkable for its depth and crystalline clearness, lies like a sheet of burnished copper under the afternoon sun in front of us.

We row out upon its surface. Not a breath of air disturbs the absolute calm upon the water. We look over the side of the boat down into the depths, and, as clearly as if atmosphere alone separated us, we see sunken trees and submerged rocks far down upon the white and sandy bottom. It is not a great stretch of ocular imagination to see the springs bubbling up through the lake bottom. The sensation when looking down into the water is one of aerial suspension. The water upon which our boat rests and floats is invisible because of its extreme purity.

The oarsman informs us that trout are taken from the lake under three conditions only: At sunrise and sunset, if the lake surface be rippled, and by still fishing at certain very deep points of the lake, which spots, however, are kept baited to attract the fish.

Fortune favors us. As the sun's angle increases in obtuseness, the maples and birches along the shore begin to nod and whisper, and millions of ripples now dance upon the lake, and presently the trout begin to leap, their silvery sides, glistening with the crystal water of the lake, give out reflections as would a sunburst upon the bosom of a bediamonded stage beauty. The trout were confined to no one spot in the lake. They were everywhere upon its surface. We try our flies and they take them. They are nine-inch fish—very gamy—and as light and bright as oxidized silver, with spots all but invisible. How we enjoyed it! We fish for an hour and count two dozen trout laid in orderly rows at our feet. We lay them in line in the kitchen at the farmhouse and find on close examination that they vary not a hair in length or width of body. They look more like young salmon of exactly the same age than anything else. Their flesh was pink, more so than any trout I have ever seen. We certainly had no criticism to make when they graced a platter at our breakfast.

What a mysterious influence the bottom of a lake or stream has upon the color of its fish! I remember once at the Rowe Ponds, fishing a small pond called Brandy Pond, because of its color. The bottom was lined with forest leaves which tinged the water. The trout we took from this lake were colored like the bottom—in fact, they were the highest colored trout I ever saw. Their skin and spots glowed with color and during their gyrations through the water, and so colored were they that their motions when on the leader could not readily be followed. And yet it was clearly to be deducted that this little pocket of a pond had been stocked by an overflow of the main lake, the fish in which were of normal color.

I am called to another court down stairs. I am in the jury box, my name being the first called. It is a personal injury case. The jury are all in their seats now and I have been asked my business by the lawyer of the defendant. I have replied, "Manufacturer of machinery," and for some reason the lawyer asks me no more ques-

tions. I don't think he likes my looks, and after he has made the rounds he will drop me out of the box. I think he imagines I will be prejudiced and "agin" him. I will know in a moment or two, perhaps. If I am discharged this will end my story. I have found more relief in writing this screed than I would have gotten from fuming and fretting over my forced presence in the court room. The occupation it has given me has certainly been pleasant, even if my facilities for easy writing have been constricted.

The jury is still undergoing a quizzing process to test their qualifications. It is not only a personal injury case, but an ugly one for the defendants—a boy with two arms burned to the elbows by electricity. I have made it plain to both lawyers that I am a builder of machinery, am a stockholder in a wood-working company, and have had considerable experience with personal injury cases in court, but it would appear, nevertheless, that I am to be chosen. Why, I do not know. I presume they think I can be fair and impartial. We are not sworn yet, and I am writing this in the jury box. After we are sworn and the ball opens, I must listen and twirl my thumbs and begin a mental process of separation between what I think is the truth and what is otherwise. The jury is accepted, so—

I am wrong. I have been excused from the jury by the plaintiff's attorney, and am not to serve on the case. Later, I asked the attorney, merely out of curiosity, why he excused me. His reply was that he feared I would carry every juror over, when in the jury room, to my way of thinking. In other words, my verdict would be the verdict of the jury. He went on to say that, although satisfied that I would give an absolutely fair and just verdict, his client's case was one that demanded considerable sympathy when the damages were being made up and he feared that I would think more of the evidence and law in the case and give less heed to sympathy. And I am once more floating on the jury sea, called, but not chosen.

Every time there is a recess or lull some disciple of Izaak Walton in the room sidles over to where I am sitting and I hear, "Been fishing yet, Cris?" The judge sits down by me and tells me of a muscallonge he took a week ago. I listen and dare not dispute the court, although I know he is human and enthusiastic.

I am called on a personal injury case—as Mrs. Josiah Allen would call it, a "dubersome" one. I must quit now, say goodbye to my readers, and attend to the evidence.

CHARLES CRISTADORO.

Camp Happy.

CAMP HAPPY was situated in the old pine grove, just on the edge of the lake.

The camp consisted of a two-room, one-story log hut built many years before, and as time had made it little fit for use, it had been patched up from time to time by some hunter or trapper stopping for a night, and now presented the appearance of a mass of logs, brush and bark, in which might be distinguished one door and two windows.

But for all this dilapidation, Camp Happy had once deserved its name, and even now every turn disclosed some rustic chair or bench that led one to dreaming of the happy time when the camp was settled and all was ready for one long week of freedom and enjoyment. As you sit on the little three-cornered bench by the old door, you remember the summer you went camping with the happy family that is now scattered.

The first morning of that delightful week you are up at 4 o'clock and out on the lake trolling, and the pickerel you lost must have weighed 4 pounds—while the one you got weighed 13 ounces. Just as you are hauling in the biggest one a voice disturbed the morning's stillness and you jumped—and the pickerel got away, but then you are somewhat consoled, for the call meant breakfast, and as you row in you suddenly remember you are hungry.

After breakfast, armed with a pail and a net, you go through the woods, the long pasture and finally come to the frog pond, where you "wade" and come out victorious with a net full of little frogs that will surely tempt the big black bass you saw in the clear, still water in the early morning.

Again that gentle reminder that you are hungry causes you to look at your watch, and you can scarcely believe it is 12 o'clock. With a revengeful "eling toward the frog that has just jumped from the pail into the pond, you take the net and heavy pail and start for Camp Happy, wondering why it seems so far away.

After the good dinner and a nap in the hammock, which, as it hangs under the big pines, is irresistible, you get out the new fish poles and rig them with the best lines and most carefully chosen hooks.

With a pail of spring water pushed under the end boat seat, the bait pail in the middle where it will be handy for both your chum and yourself, and the poles laid just so across the seats, you take up the oars and row to the old snag that sticks out of the water, opposite the old hill pine that has so many dates carved in its bark. You bait your hook with the liveliest frog you can find, throw it into the deep water midway between the old snag and the grassy point that owns the only boathouse on the lake.

You wait ten minutes—wonder why you don't get a bite—surely the bait must be gone—pull up the line, but the frog is yet lively, so again you drop the line over the other side of the boat, and before the hook sinks you feel a jerk and almost before you know it a bass 15 inches long (by your pocket rule), is flapping and splashing water all over your feet. Finally you get a good hold of him and succeed in putting him on the "stringer" that is tied to the oar lock, where he does, indeed, make a good show. You stay in this place until you think the bass must have departed to the shady side of the lake over by the big chestnut trees, so you row over there and stay until the fog begins to rise on the far flats and you know the bass are through biting for the day. You are very proud of your string of nine large bass when you land at

Camp Happy, where supper awaits you. But why is it you eat so much more when you are "resting" in camp than when you are working in town?

With the quiet evening come the voices of the cricket and the frogs, and best of all, the stories by the camp-fire that is built of dry hemlock and pine to keep away the friendly mosquito. You are just planning to dress the fish for breakfast and to go to bed in one of the comfortable hammocks, when you hear the screech of a bird nearby and you realize with sorrow that your happy dream is surely a dream, and the thoughts of the happy week are gone up in the smoke of the "mosquito" fire—and you are really seated on the old bench by the mass of logs and brush that was once your Camp Happy.

MABLE ANNIS COOK.

Camp-Fire Stories from Canadian Woods.

IX.—A Tramp Through the Wilderness.

SOME two decades ago all that vast portion of central Ontario lying between the Ottawa River and the Georgian Bay, on the one hand, and Lake Nipissing and the frontier townships on the other, was one vast wilderness dotted here and there by a lumber depot, and was known only to the wood ranger and trapper—"a terra incognita."

Only a few large timber limits were parceled out, belonging to the lumber kings at Ottawa. The rest was "Crown" domain. The term "Crown" in Canada means the Dominion or Provincial Government.

The whole country is a network of lakes and streams of crystal waters, which teem with brook and lake trout. The land is principally mountain and rocky ridges generally clothed with primeval forests of pine, whose plummy giants on the hilltops towered aloft in adoration of their Divine Creator.

The lumber firms employ "wood-rangers" to explore and examine their vast limits, the "avant courier" to those who carry on the work. The duties of "wood-ranger" were arduous and required years of training and experience to fit him for such a responsible position. Within recent years a certain large firm lost over a million of dollars through the carelessness or improper estimate of their rangers, paying hundreds of thousands of dollars for a small limit, the timber falling far below the estimate, and, a large portion proving to be punky and consequently worthless. Going into the lumber woods in his youth, first as road cutter, then as log-maker or hewer, then, perhaps, as foreman, and again as culler, he gradually acquired proficiency. He must prove himself to be a "courrier-du-bois," half hunter, half surveyor, and versed in all manner of woodcraft. The vast and impenetrable forest must be as plain and open to him as his own country lanes, or the streets of his native village. It was, however, in looking up and exploring new limits which required the services of the very best men. First supplies would be taken into the wilds by canoe and portage, and properly cached, then the ranger would start out on his lonely journey, and for months, perhaps, he would not hear the sound of a human voice. It may easily be imagined how interesting the recital of the trials and experience of these rangers might be.

In my early visits to the lumber depots I fell in with many of these men and determined that, should the opportunity offer, I would endeavor to share with some of them the perils and adventures of their lonely tramps.

It is a custom with lumber firms to require their local ranger to make a tour of the limit to see if any trespass has been committed by adjoining proprietors or their jobbers. These tours of inspection are taken toward the end of the season, during the month of February, and the trip must be made on snowshoes.

I received an invitation to accompany one of these rangers. Our equipment prepared, we set forth from one of the lumber camps. Our duty was to follow the limit-line, thus making a circuit of the whole limit. During the first day I was curious to know what kind of a camp I was going to sleep in, or if I should lay out like the deer in some balsam thicket. About an hour before sunset we selected a spot in a thicket. We built our fire against a large rock so that the heat would be retained and reflected back into our camp. Then long, slender stakes were placed in the snow, so that they stood at about an angle of thirty degrees, about a foot or so apart, and extending the width of what our camp should be. Then a cotton cloth was thrown over. The sides fastened down upon the snow by heavy sticks, as well as the back part of the same, which reached down the stakes to the snow. This is the kind of tent used by the Indians, very light to carry, and forms a complete shed-tent. With a liberal amount of boughs to protect from the cold and damp of the snow underneath, and a fire at the front, these tents are very comfortable in cold weather. There is one thing about them, one never suffers for the want of fresh air. One of the most important points is to collect enough fire wood to last through the night. After a "snack" and a pipe we fix up our fire and roll into the blankets. After about two hours or so the fire burns low and we are awakened by the cold, we throw on a few sticks and perhaps take a pull at the pipe and again roll over to sleep. This is repeated until we wake up as the gray dawn appears, when we rouse ourselves for the day's experience.

The beauties of a pine forest cannot be described by pen or picture, the pine forest must be seen and experienced in all its pristine glory; the stately columns, the moss-covered rocks, and, above all, the air laden with resinous odors.

Our duty was to explore the limit as well as to follow the line, and, in our excursions we had the good fortune to witness scenes which seldom fall to the lot of a novice.

On one particular trip we came across a lakelet along the shore of which entered a spring that did not freeze up. About the spring we saw numerous deer tracks, from which we concluded the deer came down to drink from their winter yard near by, but the snow

was tracked up, cut up and scraped—no farmyard could be more cut up by a flock of sheep. As there were plenty of brook trout to be seen, we thought that a few of them would be an acquisition to our slender larder, and, in the meantime we might obtain an explanation of the numerous deer tracks. Accordingly on the following morning we started for our fish. The wind, fortunately, was in our favor, for when we came in sight of the place we saw a large drove of deer at the spring. We quickly concealed ourselves and waited for developments. There were, perhaps, thirty deer in that crowd, which included many young ones. It was a bright warm morning, and those deer on the glistening snow, with the dark pines for a background, made a beautiful picture. Presently the fawns began to skip and play, and this accounted for the numerous deer tracks in the snow, which afforded us so much conjecture the day before. They bounded over one another—upon the backs of the old ones—their gambols were precisely similar to those of lambs in the spring. We enjoyed the view until the deer departed, then caught our fish and returned to camp.

On another occasion we came out on a lake which was about two miles long and pretty well windswept and the ice glare. We heard a racket, made by wolves, not knowing but that it might be a pack upon our track, we prepared to take to a tree, having left our rifles in camp. Presently a fawn came out upon the ice, followed by wolves, one on each side, at about a hundred yards or so from the deer, with several others directly behind the same. So soon as the poor deer reached the ice it was helpless, and could make but little headway. The wolves seeing this, closed in, and as we saw they would surely catch the fawn, we began to shout, but they paid no attention to us. We ran to camp for our guns, but when we returned nothing but a few stains of blood, some hair and a few crumbs of bones were all that was left of the unfortunate deer, and the wolves were nowhere to be seen.

After tramping over mountain and swamp, through pine forests clad with snow, we reached the end of our trip and returned to the lumber camp. A summer canoe voyage is delightful, but you have the flies. A winter excursion is attended with hardships, it is true, but you are repaid by the glorious scenery and the health-giving exercise.

E. B. F.

A Relic of the Old Frontier.

YEARS ago, before the advent of paved streets and fourteen-story buildings, when the town of Dayton consisted of a very small group of log cabins collected at the confluence of the Mad and Great Miami rivers, a man named George Newcom erected a large tavern, near what is now the corner of Main street and Monument avenue.

This tavern was built in the year 1798, and was the pride of the whole region. It was two stories in height and contained four rooms. It served jointly as the first tavern, store, church, court house and jail in Montgomery county, and was the first house chinked with lime mortar in the town. In it also Jane Newcom, the first white child born in Dayton, saw the light of day.

In 1800 a man named McDougal opened a store in the building and did a flourishing business with the Indians. Three years later the first county court was opened in the tavern and the law violators, so common to frontier communities, were brought to justice. Those convicted were either flogged or fined a certain amount of furs or grain,

THE OLD NEWCOM TAVERN.

which was the chief currency at that time. While in confinement the prisoners were kept in the corn crib or in a dry well on the lot.

Col. George Newcom, the builder and proprietor of the famous tavern, was Irish by birth; emigrating to America with his parents in 1775, and settling first in Delaware and later in Pennsylvania. Marrying here he removed with his family to Cincinnati in 1794. Two years later he accompanied a party of emigrants to Dayton, and assisted in laying out the place. He then erected the tavern and continued its proprietor for many years. He served as a soldier in Wayne's famous campaign and also in the War of 1812. He was a member of the Ohio Legislature for twenty-three years. He lived to the advanced age of eighty-two, dying in February, 1853.

While proprietor of the tavern, he had considerable trouble with the Indians. They would come to the settlement to dispose of their furs, and after getting drunk on the proceeds, would come to the tavern and attempt to bully the landlord, but in this they were generally worsted. The strong, active pioneer proved more than a match for the drunken redskins, and they were generally landed in the jail, where they were kept until sober. When the tavern passed out of Newcom's hands, its name was changed to the Sun Inn.

The country surrounding Dayton was a perfect paradise for sportsmen in the early days. The Indians were well aware of this and were loth to give it up. Indeed, the rivalry was so great and deadly that it gained for the valley the name of "Miami Slaughter House." Deer, wild turkeys, foxes, pheasant, quail and rabbits were plentiful, and 'coon hunts and squirrel hunts were the order of the day. In 1822 there was a squirrel hunt in which one thousand of the little animals were killed. At times migrations of squirrels took place, and even the rivers could not turn them from their course. It is said that men and boys would stand along the banks of the Miami and kill them with clubs as they came out of the water.

Curwen, the first historian of Dayton, thus describes the method of fire-hunting as practiced by the pioneers: "The deer came down to the river to drink in the evening, and sheltered themselves for the night under the bushes which grew along the shore. As soon as they were quiet, the hunters in pirogues paddled slowly up the stream, the steersman holding aloft a burning torch of dried hickory bark, by the light of which the deer were discovered and fired on." All this took place in plain view of Newcom's tavern.

Fishing in both the Mad and Miami rivers was excellent, and in 1835 a seining party procured two wagon loads of fish in the course of an afternoon.

As Newcom's tavern was the central point of interest in the village, no doubt the hunters and fishermen assembled here in the evenings and "swapped yarns."

In 1896 the centennial celebration of the founding of Dayton began, and public interest in the historic old building, which had lagged for some time, was again aroused, and steps were taken to preserve the famous relic.

Surrounded as it is by tall modern buildings, it looks strangely out of place, but in its day it was of more importance to the county than the most stately one is today. It stands in a beautiful lawn, facing Monument avenue, while at its back the Great Miami flows silently by, just as it did on that eventful morning of April 1, 1796, when the pioneers landed and began the foundations of the "Gem City."

As you approach the front door, the first object that catches your eye is a pair of antlers over the doorway, recalling the happy hunting days of the past; and when you step inside and close your ears to the noise and confusion of the city, it seems as if you have been transported into another world. There is the big fireplace, with its crane and pot hanging over it. There are the old-fashioned candlesticks, spinning wheel, loom, cupboard, table and benches, such as were used by our forefathers in the early days. The walls are decorated with 'coon skins, bows, arrows and flintlock rifles, while on the ceiling overhead a quantity of seed corn is hung up to dry. This was the living room. In one corner of the room a rude stairway leads to the sleeping apartments above, while to the right of the stairway a door opens into another room, which was once used as court room and jail. This room now contains a fine collection of pioneer relics, many of which are rare and valuable. An examination of the tavern and contents is well worth a visit to the city.

CLARENCE VANDIVEER.

MIAMISBURG, Ohio.

Natural History.

Visits with Apes and Monkeys.

I.—Visits with Man-Like Apes.

THE "Manlike Apes," so called from their close resemblance to man, comprise the gorilla and chimpanzee of Africa, and the orang-utan and gibbons of south-eastern Asia. They are easily identified by their human-like countenance and structural resemblance to man, which, by the way, is most striking in the young, undeveloped apes. The gorilla, chimpanzee and orang-utan assume a stooping posture when on the ground, supporting themselves by their long arms, their fingers doubled into the palms of their hands. The gibbons are the only members of the order primates that can naturally walk upon their feet without the support of their hands. The expression of apes is nearly as varied as with the human race.

During the summer of 1897 the London Zoological Garden contained two fine specimens of chimpanzees named Daisy and Jemima. Glossy black and in the prime of health, they were by far the liveliest and most interesting animals in the gardens.

They were fond of play and spent hours frolicking together. In the excitement of the game they frequently uttered smothered chuckles of delight as though trying to suppress laughter, and they repeated these sounds whenever anyone played with them, and doubled their head beneath their body to protect their chest when tickled.

It was interesting to watch them while at play. In attempting to escape from each other they swung hand over hand from bar to bar, or when one secured a rope she tantalized her mate by swinging the end toward her; taking care that it did not come within her reach.

Once Jemima, while eluding pursuit, jumped to the side of the cage and clung to a warped board, which afforded but slight hold. Her feet had no support whatever, which gave her little chance to spring, and being beyond reach of any of the perches, she was certainly in a dilemma. She seemed at once to realize her position, and began to cry. Her companion, quite bewildered for the minute, looked at her as though wondering what the fuss was about. As Jemima's grasp grew weaker she cried louder, and looked below to note the distance to the floor. Daisy at last went to the end of the perch, extended her hand, which was quickly accepted, and lifted her playmate safely back to the bar. The keeper informed me that he had frequently seen them assist each other in this manner.

Daisy was the stronger of the two, and after a couple of hours of such play, Jemima, completely ex-

hausted, came to the door of the cage and begged to be put back in her own compartment.

At night Daisy carefully covered herself with a blanket, and when the keeper attempted to take it from her, she climbed to the top of the cage and hung it beyond his reach. She showed her contempt for children by spitting at them, and when several Japanese marines came into the building, all of the apes became greatly excited. Daisy shook the netting, "hoo hooed" loudly and spit at them, while her companions took up the cry, and for a time the house was a perfect bedlam.

When anxious to play Daisy greeted me by coming to the front of the cage and hammering on the wires, and if I failed to accept her challenge, she extended her hand, and when I attempted to take it, drew it back and thrust it through another opening further away.

The keeper once entered the cage, fastened the door and left the keys in the lock. While he was busy one of the apes removed them, and mounting to the top of the cage, held him captive. It was necessary for a visitor to hand him a pole in order to frighten her into dropping the stolen property.

When the keeper pointed to a stranger and called to them to "put him out," they both became greatly excited. Screaming with rage they tried hard to reach the visitor, and no doubt if they had succeeded he would have been injured severely. After he had departed they were alert when anyone entered, lest it be the object of their former indignation. When scolded they usually retired to the back of the cage and cried, but as the keeper changed his voice to tones of forgiveness, they at once came to him, threw their arms about his neck and softly sobbed, acting as though they wanted to say, "We will never be bad again."

During the period that I was studying in London two young chimpanzees, in emaciated condition, were received at the gardens. The first few weeks they spent cuddled in each others arms, as far from the gaze of visitors as their limited quarters would permit. For a long time their death was expected, but they gained strength through careful nursing by their keeper, Mr. Mansbridge, who fed them on beef tea, broth, gruel and fruit, and when I left they were in fine health. The expression of one was so suggestive that he was at once named "Mike." He was particularly fond of beef tea, and when the keeper approached with some, he eagerly took the cup, drained its contents and hurried across the cage to steal his companion's share, which, of course, the keeper would not allow; whereupon there was great wailing.

A fine specimen of this species of ape in the Zoological Gardens at Antwerp, amused the visitors by clever tricks; but one antic that had never been taught it was to allow a large pigtail monkey to ride about the cage on its back; a comical sight, indeed.

But to return to the London Zoological Gardens. Of all lazy, indolent creatures, Flora, a large orang-utan (Man-of-the-Woods in Malay language), held trumps. If she chanced to be at the back of the cage when I entered the room, rather than trouble herself to rise and walk to me, she rolled over and over until near enough to suck my finger. When disturbed by visitors she took her blanket and climbed to the roof of a small sheltered box, and carefully covered herself and slept. She wore a look of great responsibility, and when meals were not served to her liking she moved about restlessly and whined.

But all orang-utans are not like Flora. Three which came into possession of the New York Zoological Society when they were infants, were quite the reverse. They were received before proper buildings were erected for their accommodation, so they were placed in a stable heated for their special benefit. Bedding was furnished for their comfort at night, and to a casual observer, the orangs, when sleeping, appeared like bundles of blankets, but if disturbed, three little red heads were uncovered and inquiring eyes asked if the intruder was a friend; when satisfied, a human being could not have rearranged the covering more carefully than they did. As cold weather set in, it became evident that the room could not be warmed sufficiently, so the orangs were removed to the director's residence.

During the visit with him they were frequently given the liberty of the cellar; sometimes they pried a slat from their cage and took it without consent and at once started on an excursion of investigation and mischief. They tore down door bell wires, upset bottles and jars, and converted themselves into black apes by rummaging about in the coal bin. If the cellar door was left open their travels extended to other parts of the house, and on one occasion the director's wife came suddenly upon an orang seated in the center of the dining table calmly helping herself from a dish of preserves.

At last the reptile house was so far completed that the orangs were transferred to the conservatory at the west end of the building. Here they lived pending the construction of the small mammals' house. They had not been long in their new quarters when the boilers got out of order, and it became necessary to extinguish the fires during the repairs. It turned cold as soon as the work commenced, and at night the thermometer fell alarmingly low for the comfort and health of such delicate animals as anthropoid apes. About midnight the watchman woke me to report that the mercury in the conservatory registered sixty-seven and was falling rapidly. With a blanket I covered the cage containing the two apes, while the other orang, Sadong, was taken back to share my bed for the rest of the night.

Placing her on the side nearest the wall, I settled myself for sleep. Sadong gazed about the room and became particularly interested in the head of a large mountain sheep, then she extended her long, scrawny arms and attempted to play with her shadow on the wall. Tiring of this she amused herself by fondling my hair, examining my ears, and several times gently touched the lids of my closed eyes with her fore finger. She was extremely timid and threw her arms about my neck and whimpered whenever I moved, fearing, no doubt, that I was going to leave her. Several times she attempted to rise, but I covered her with the bedding and spoke sharply, and as though she understood my meaning, she lay quiet and at last became accustomed

to her surroundings and fell asleep.

The washstand stood at the head of the bed and a pitcher of water on the end nearest to me. During the night I was awakened by a movement, and glancing up discovered that my little charge, having crawled from under the blankets—had started upon an exploring expedition and was in the act of climbing upon the washstand. At my sharp command she drew back, and in her fright caught the handle of the water pitcher, dragging it after her. The contents struck squarely in my face. I jumped to my feet, the water streaming from my head and night clothes, while Sadong, one arm about my neck, the other clinging to my hair, nearly deafened me by her cries. She would not consent to be left alone, but while I changed the bed clothes, screamed, and clung tightly to me. I regret that no spectators were present to witness this ridiculous performance, for without exception it was the funniest experience of my life.

All three orangs were very affectionate, and never missed an opportunity to be taken from the cage. When called they walked to the keeper, put their arms around his neck and clung to him in a suggestively human manner. Upon being replaced they lost their temper, threw themselves upon the floor, rolled over and over, screamed and beat their bodies, or hammered on the floor like a child in a tantrum. At last, hurrying to the furthest corner of the cage they sat with folded arms, whimpering softly.

They were particularly fond of baby foods and emulsions of cod liver oil, and licked the spoon clean, often crying for more.

Baths were given them twice a week, which at first were not received with particular favor, for they cried and fought, but soon became accustomed to the water and sat contentedly in the tub, clinging to the sides. While the keeper sponged them they splashed the water, and holding their hands above their heads, allowed it to drip into their mouths. They willingly took their turn, and while waiting, came to the front of the cage and watched the operations performed on their cage-mates. After the bath, they lay quiet while the keepers rubbed them dry with towels, each then put a blanket over her head, drew it around her body and sat for some time with only face exposed.

Sadong was the healthiest of the three, and took great delight in teasing her companions. They endured it until their patience was exhausted, then showed their objections by biting her hands until she ceased her antics. I have repeatedly seen her, while clinging to a bar with her feet, reach down with her long arms, lift one of the weaker orangs a few inches from the floor and let it drop with a thud, or beat it on the bed of straw. Again, while wrestling she would catch her nearest companion by the hair and deliberately bump its head several times upon the floor.

One of Sadong's favorite tricks was, after being fed, to walk about the cage with the empty stewpan upon her head, or if the keeper went away she hammered it on the floor, and upon his return all that remained of the dish was a battered mass of tinware.

During midsummer they were taken out frequently and allowed to exercise among the trees. When on the ground they were very timid, and if the keeper attempted to leave, they cried and hurried to overtake him, then clung to his legs and begged to be taken up. Among the branches they were quite at home, and sometimes it was necessary to offer fruit in order to coax them down; again the keepers were obliged to climb the trees before they could be recaptured.

Probably New Yorkers never expected to see orang-utans building their nests within the city limits, yet for four summers this has been witnessed by many people who visited the Zoological Park in The Bronx.

The orangs, when first liberated, usually busied themselves climbing among the branches, but finally settled down to nest building. After selecting a suitable crotch they gathered twigs within reach and piled them one upon the other; if the branches were large they bent and used their teeth to break them; again they twisted persistently until the limb gave way. With these they built rude nests or platforms, to which they retired to rest. Their period of liberty was too short and infrequent to be wasted in idleness, however, for they seemed to take more pleasure in constructing the nests than in occupying them, often building several nests in one tree. In climbing from tree to tree, where the distance between branches was too great for them to span, they swayed the branch to which they clung from side to side until able to grasp a limb of the adjoining tree and cross over.

Well do I remember old Hercules, a large orang-utan that arrived from Borneo on an East India tea vessel. When first I saw him on the steamship, he was lying on his back in a cage so small that he could not stand erect. One of the stories told of him is, that while en route, one of the crew gave him three bad eggs. Breaking each he put it to his nose, then cast it aside in disgust. A fourth egg offered, was without examination, promptly hurled at the giver, accompanied by emphatic Simian oaths. (I take salt with this yarn.)

On arriving at the park, he was a fit subject for a bath, but owing to his strength and temper we could not handle him in the usual manner, so when he reached through the bars to accept an orange, his arms were caught and held, while a keeper entered the cage and pinioned his feet. A tub of water was procured, and while he lay upon a bed of straw, held by three keepers, a fourth sponged him, and later he was rubbed dry with towels and given a thorough massaging, to start circulation and limber his cramped muscles. He fought hard and attempted to bite the keepers, giving vent to his wrath by loud guttural sounds. When the operation was finished he slunk away and covered himself with a blanket.

At Berlin I saw a huge orang, which the keeper took from the cage, and they walked arm in arm to an ante-room, where the ape busied himself shifting coal from the bucket to the floor and back again. He then took a poker and opened the stove door. As a spark flew in his face he winced, rubbed his eye and blew at the hot coals as though to cool them.

OWEGO, N. Y.

J. ALDEN LORING.

Quail in the Clothes Basket.

SPRINGFIELD, Mass., July 4.—John Glenn, a farmer, in Feeding Hills, a small town a few miles west of here, was plowing recently and disturbed a quail. He looked on the ground and was not surprised to see a nest with 15 eggs in it almost under the feet of the horses. He turned the plow to one side, so as not to disturb the nest, and continued with his work, thinking little more of the matter.

His dog was with him at the time, and that night he remembered that the dog had gone back. This troubled him, and he told the story to his daughter, who at once took an interest in it and went to the nest, only to find that the dog had evidently driven the mother quail away, as the eggs were cold and the nest deserted. Miss Glenn supposed that the eggs were spoiled because they had become cold, and picked them up and took them home to prevent the dog from spoiling the nest. She took them into the kitchen and placed them all in a basket that was half full of clothes and was placed near the stove. Some more clothes were thrown over the eggs and they were forgotten. The next morning Miss Glenn went to the basket to get the clothes and was decidedly surprised to hear a cheerful line of chirps coming from it. She lifted the clothes and eleven bright-eyed, striped little chicks stuck their heads up from the basket and then huddled together just as all well mannered quail chicks should. During the day the chicks were fed on crumbs of bread and oatmeal at intervals, and seemed perfectly willing to eat everything that came their way. All the time they kept chirping and trying to say "Bob White." The next morning, when they were just a day old, Miss Glenn took them in a little box back to the place where she found the eggs. She poured the whole brood out on to the ground and expected that they would vanish at once. She was greatly surprised to have the entire eleven come scurrying back into the box again and refuse to leave it under any circumstances. So she took them back to the house again. That evening she took the brood once more to the nest and again freed them. In an instant they had all disappeared, and that was the last that has been seen of them. It would be interesting to know why the youngsters refused to be turned loose the first time and then went with a rush the second. One theory is that the old hen bird was near the nest and in some way called her chicks, who recognized the mother call by instinct. CLICK.

Squirrels in City Parks.

BUFFALO, N. Y.—Will Vermonter, who writes in this week's FOREST AND STREAM about gray squirrels that abound in the city of Burlington, or other readers, give information in regard to stocking city parks with squirrels, the kind best adapted to that purpose, whether gray or fox, or both, and any suggestions as to the care they require.

A Story of Fluster.

OAKLAND, Cal.—Editor Forest and Stream: Although a reader of FOREST AND STREAM for a great many years, I cannot call to mind ever seeing reported in its columns any such experience as that which I propose to relate. It is to be hoped that it is for the excellent reason that such things do not occur, and like enough also that few people ever care to acknowledge being caught napping. I have certainly never lost any sleep worrying over the probability of its recurrence, and now there is every reason to believe that the faintest possibility even is forever removed. The incident occurred while hunting grouse along the edge of the big timber in the Willamette Valley, Oregon.

At that time grouse were very plentiful, and used to saunter out into the stubbles along toward sundown in goodly numbers to feed. On this particular evening in the early fall, after a heavy shower, I started out to try my luck for a fry without a dog, not having any at the time. After a long tramp through all the favorite haunts of the birds nearly without getting glimpse of a feather, I had come to the conclusion that it was the weather. The sun gleamed out unusually hot after the rain with that sweltering heat which made things steam and the perspiration trickle, that caused the birds to sit so fast and be so little doing. It had certainly become most decidedly monotonous.

After having about given up all hope of grouse for breakfast, I was strolling along in a semi-hypnotic condition, totally oblivious to the matter in hand—a state of mind induced, no doubt, by the humidity of the atmosphere and the tranquil beauty of the sylvan scene, when I suddenly found myself in the very center of a charmed circle—so full of charm, indeed, that what little wits I had took unto themselves wings and flew away—flew away with the birds. Now, the birds themselves must have been in a trance or they would never have permitted me in such close quarters without making a move, having almost stepped on some of them.

For inside of a circle of not more than twenty yards in diameter there suddenly arose with a roar like a cyclone a flock of grouse. How many? Well, I'm not telling anybody—this is no fish story. But there I was in the midst of them, the most demoralized sportsman that anybody could ever hope to see. Pshaw! anyone else would have killed not less than a dozen of them—in their minds. But I, for the first and last time in my life, not only parted from my wits on such an occasion, but lost my gun as well. Of course, the first move was to get my gun into business, but owing to the unexpectedness of the thing that happened, this instinctive movement totally failed of accomplishment. In my fright I pulled off one of the barrels at the first move; not having anything to butt against, the recoil broke my hold, and it was free to go as impelled, the jerk my left arm had given it (the gun was lying in the crook of my left arm, at full cock, at the time) under the impulse of the scare, threw it clear

way, and the gun fell several paces from where I was standing. The other barrel didn't explode, for a wonder; anyway it fell muzzle away. The last jinks gave me the first jolt of all; what little thinker was left "thunk" a hole lot between the time the gun left my hands and the time it was resting safely on the ground. Thus ended the hunt. I couldn't have hit a haystack after such a shaking, so I wended my way homeward, a sadder but a wiser man.

It has always been a matter for surmise in regard to the theories which would have been set up as to how this man met his death, if things had gone amiss. He is seen start out hunting alone, and is found dead from a gunshot wound and his own gun lying several paces away, discharged, and not by any means necessarily in line when he came to rest on the ground. All this without the slightest stretch of the imagination was at the instant the direct line of possibility. Of course, if the facts in the case could have appeared, the universal opinion would have been that the fool killer had been getting in his work. Verdict unanimous—acquittal.

I have seen many large bunches of game birds, but never anything approaching to that, and distance fails to add any enchantment to the view. One has read of a invocation of crows; this must have been a parliament of grouse. What they were doing bunched up like that a time in the evening when they had invariably been and scattered out foraging before going to roost, is more than I was ever able to make out, unless it was that they were making family arrangements for another season. Perchance the angel dropped a tear when he recorded my excuse for being empty-handed—such a very usual thing, don't you know. I could not possibly word to give my blamed fooling away.

WANDERER.

Meadowlark and Robin.

Editor Forest and Stream:

Your correspondent, Dixmont, expresses indignation concerning my defense of the Rev. Craig for shooting meadowlarks, and Hie-on's allusion to shooting robins and waxwings. It is easy for me to understand and appreciate Dixmont's sentimental attitude toward the robin, but I had never supposed that any sentiment attached to the meadowlark, even in the North. Some of these birds (larks) remain in the United States during the breeding season; but no one in these States, so far as I am aware, includes them in the category of "song birds."

The law of Mississippi recognizes the meadowlark as a game bird, and he is protected by the game law during the close season, along with the other recognized birds of that class. Moreover, he is invariably found in association with doves and partridges in the spring and winter months, feeding on the same ground with the same general habits.

Audubon says of the meadowlark: "During the latter part of autumn, as well as in winter, this species affords a good deal of sport, especially to young gunners." And, "when on the wing they seldom fly close enough to allow more than one to be shot at a time. When wounded they run off with alacrity, and hide with great care, so as to be found with difficulty."

Also, "In every cornfield in the State of Kentucky you are sure to find them in company with partridges and doves." And again, "It will not stand before the hunter longer than a moment, and that only when surprised among rank weeds or grass." He says further they are "offered for sale in almost all our markets."

It is evident that Audubon was not shocked by the shooting of these birds, as he doubtless shot them himself; and yet Audubon was the most enthusiastic of bird lovers.

The truth is, that the question as to what birds ought to be shot and vice versa, is, like many other questions, a purely local one, the "point of view" being everything in determining the pro or con.

It is easy to understand the sentiment that in the North surrounds the "robin red-breast" with a sort of poetic affection akin to reverence; but the basis for such a feeling is wholly wanting in the Southern, or at least in the Gulf States; and the reason for the difference is readily explained. The robins spend the breeding season in the Northern States; they diffuse themselves throughout the land in mated pairs, resort to the orchards, gardens and lawns, and nesting in the houses. They become quasi domestic in their habits, affiliating themselves with humanity. They are, moreover, handsome birds and sweet songsters in the breeding season, and appeal strongly to the affections of old and young among their human neighbors and friends.

But when they come South their character is entirely changed. They arrive here in bleak November weather, scudding upon the wintry north wind, and the harbingers, not of springtime as in the North, but of frost and icy weather.

They sing no songs here, and do not cultivate the human side of their environment; but assembling themselves in large flocks, confine themselves mainly to the open woods, where berries are abundant, and grow exceedingly fat and juicy feeding upon them.

Dixmont says of the robin that, "dead they are useful," and Dixmont's view is quite natural for one in that position. Nevertheless, it is true that a fat robin, when broiled, is about the most delicious morsel that ever graced an epicure's table.

Robins are not generally shot by sportsmen in the North, for the plain reason that shooting them affords no sport to a skillful gunner. Neither are they shot for the sake of killing something, as suggested by Dixmont. Hie-on thought they would be more suitable for a young lady's prowess than the more difficult sport of following the setters through wet cornfields and shooting partridges on the wing.

Robins are killed by boys, negroes and pot-hunters; and find ready sale in the markets, as they are highly esteemed from a culinary point of view.

The robin question has a close parallel in that of the colink, another cherished songster of the Northern States in summer time. He also changes his character

completely when he comes South in the fall and winter. In Maryland he becomes the famous delicacy of the restaurants, known as the "reed bird"; while in South Carolina he is the "rice bird," and in Louisiana he bears off the palm among the epicures as the "ortolan," the most cherished of the delicacies served in the hotels of New Orleans.

The rule seems to be that certain birds that do most regale the æsthetic senses in the lands where the spring and summer months are passed, do also most appeal to the gastronomic side of human nature in those regions where the fall and winter is passed by them in the sole occupation of getting fat and delicious for table purposes.

While we may abhor the idea of butchering a pet for instance, for the table, we feel no such compunctions about selecting one out of the flock for the same purpose.

Dixmont should recognize the fact that the shield upon which he is looking from his viewpoint presents a very different appearance when viewed from the opposite side.

COAHOMA.

Note and Comment.

The Deadly Toy Pistol.

Editor Forest and Stream:

The editor, in the current number, July 4, gives the toy pistol a scoring, and he is right, the sooner the toy pistol and the manufacture and sale of it are forbidden by law the better. When that takes place we shall have a few more boys to raise. The coroner of Allegheny county, Pennsylvania, has held no less than twelve inquests in the past thirty days on boys who have died from lockjaw, caused by toy pistols in every case.

The pistol, in itself, is harmless, of course; it is the mercury put in these small cartridges to make them give a loud report, that causes the mischief. If black powder only were used then the result would only be a sore hand for a few days, and no lockjaw. But a toy pistol can be got for a few cents, and as long as they can boys will use them. Keep after that toy pistol in and out of season until it will be by law as much of a crime to sell one to a boy as it is now to sell him a dose of poison.

I have noticed quite a number of complaints lately, both in the FOREST AND STREAM and in other papers (the most of them have been in the other papers) about these game reserves, which some of our men, who have the money to spare and the inclination so to use it, have established in different parts of the country. The only game reserve that I have a personal interest in is a big one out in Wyoming, but I cannot use it to hunt in, we keep it to give part of what game we have left a chance to stop long enough in one place to see whether they are there or not, and not to be blown somewhere else before they find out just where they are. I do not hear any complaint made about this reserve, because I suppose it belongs to all of us, and costs us nothing to keep it, the Government does that.

I have no complaint to make about those private reserves, I only wish that there were more of them, they are generally found on land that is fit for nothing else, and sooner or later a part of this game in them will break out of bounds; some of it may be turned out; then it will be our game if we want it.

If I had the money that some of these men have I have often thought that there would be another big game preserve, but I would want mine somewhere south of Mason and Dixon's line, in Georgia probably. Then next I would want a good sailing yacht, one with auxiliary steam power, and with no fancy work about it, inside or out, but one large enough to take me anywhere on the globe that I wanted to go to; it would probably have to take me around the Horn or through the straits, and in the Pacific before I had it long, and I would not need a captain or sailing master, I could attend to that part of it myself. Then after I had built the finest schoolhouse that money could put up, in the ward I was born in, I would quit.

CABIA BLANCO.

Both Satisfied.

It falls to us who live in the country the year round to hear amusing stories from the guides of their experiences with the "tenderfeet" that visit the north country during the open season. One that showed the cuteness of the guide was told me shortly ago by the man himself.

Dr. S— came to Roberval with the expressed wish of taking home a caribou head of his own killing. He engaged George Skene as man of all work, and Old Basil, the noted guide and successful hunter.

Although it is not customary for guides to take their guns when out with gentleman sportsmen, yet Old Basil was an exception, as he always insisted on taking his. Around the camp-fire Dr. S— spoke of his great wish to kill a caribou.

"Now," he said to old Basil, "You bring me up close to one and I kill it, I'll give you a bonus of \$10."

Several times next day during the still-hunt old Basil would leave the doctor to await his return, while he would go forward reconnoitering carefully so there might be no mistake. At last he came back with the glad tidings to the doctor, that he had seen two caribou not far in advance of where they now were.

When it got to sneaking after Basil through the last hundred yards to the few trees at the extreme edge of the forest, the doctor's heart was beating with such thumps that he thought the noise would start the game. The doctor at last reached the guide in the fringe of trees. Basil told him that one of the deer was standing up, broadside on, while a little to the right was the second one lying down. The standing one being the larger of the two, and the only one having horns, was for the doctor to shoot, while the guide would take a pot-shot at the other. The doctor flattened out on his stomach and wriggled a few feet further, saw the deer through the branches, took

aim and waited for Basil to count the agreed one, two, three.

Basil argued with himself that from the uncertain way the doctor's gun was wobbling about there were several hundred chances to one against his hitting the deer, and as a consequence, he would be minus his bonus.

So he employed a ruse. He counted the agreed signal to fire, but instead of firing at the one lying down, he drew a bead on the doctor's, and, of course, killed it.

At the report of the guns the caribou on the ground sprang up, and old Basil, with consummate prevarication, said, "Oh! I missed it!" Aimed again, let go the other barrel and killed this one also.

The doctor was wild with delight at his successful first shot, and expressed in many words his pleasure to old Basil, who took it all in without a blush.

The old guide, who was standing up back of where the doctor fired, had taken no chance of missing with his smooth bore, but fired point blank at the deer's fore quarters. There was found on examination a frightful wound, and smashed bone; but the doctor was not versed enough in woodcraft to distinguish if this had been caused by a round bullet, and not the conical one from his own rifle.

The doctor was not a pot-hunter; he had what he came for, and had got it in almost record time, and was satisfied, so he fished for brook trout while Basil carefully prepared the head for transportation and dried the meat for his own family. Then they journeyed back to Roberval, where the men were paid off, Basil receiving a bright \$10 gold piece as promised over and above his wages.

The doctor no doubt has that head, beautifully gotten up, hanging over his sideboard, and points to it with pride to his guests, saying, "I killed that head back of Kis-ki-sink, in Canada."

MARTIN HUNTER.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Salmon Culture in America.

In the English Fishing Gazette of June 13, Mr. R. B. Marston reviews the salmon culture discussion in the FOREST AND STREAM, and comments as follows:

"One of the conclusions arrived at by the Salmon Fisheries Commission last year was that until satisfactory evidence was forthcoming respecting the success of artificial culture of salmon it could not recommend the establishment of State hatcheries.

"It seemed to me that this was such a damaging blow at fishculture in connection with our noblest fish, that I thought it would be well to see what was the opinion on the subject in America, and I wrote a letter to that excellent sporting paper FOREST AND STREAM, which appeared on February 7 last, asking for information.

"The result was, I must admit, astounding to me. My inquiry gave rise to a long correspondence on the subject, from which, I regret to say, it seems to be abundantly clear that as far as the true salmon (*Salmo salar*) is concerned, its cultivation in the United States and Canada is an admitted failure. During the last twenty years or more the Fishing Gazette has published accounts of the work of the Canadian and American Fish Commissions in turning millions upon millions of artificially bred salmon fry into the rivers flowing into the Atlantic and into the Pacific. The late Mr. A. Nelson Cheney sent me some ten or twelve years ago particulars which seemed to prove that several Atlantic Coast rivers had benefited greatly by salmon culture, and I fully expected that my inquiry recently would have confirmed this.

"The first reply was from a correspondent signing himself as The Old Angler. [Mr. Marston quotes it in full.]

"In FOREST AND STREAM for March 7 appeared a long letter from Mr. Livingston Stone, which has already appeared in the Fishing Gazette. It practically admitted that as far as experiments with *Salmo salar* in the rivers flowing into the Atlantic were concerned they had come to nothing, but it claimed brilliant success with the Pacific Coast rivers. Unfortunately, as The Old Angler pointed out in a long reply in FOREST AND STREAM of March 21, salmon had never been extinct in any of the Pacific salmon rivers; on the contrary, in spite of the enormous drain for the great canneries which send canned salmon all over the world, the natural supply was still incredibly great. As far as the salmon of the Pacific Coast are concerned, it seems to me that it must be very difficult to prove that artificial culture is or is not beneficial. It is admitted that fish in incredible numbers can still reach the spawning beds of the rivers, and as long as that is the case it is impossible to prove that turning in some millions of artificially hatched fry materially increase the catch of salmon. It is impossible to prove it, but it is also impossible to disprove it. The fact that such an able and experienced pisciculturist as Mr. Livingston Stone is convinced of the value of aiding nature where over fishing is the only reason for falling off in the supply of salmon, is a fact not lightly to be brushed aside. To wait until the salmon of some Pacific Coast river have become extinct before attempting to stop the drain seems to be absurd. On the other hand, it is open to question whether the money and energy expended on artificially producing fish for such rivers might not be far better employed in preventing over-netting and trapping salmon, and in seeing that natural spawning of the fish is not interfered with. The salmon of the Pacific Coast are not the same as our Atlantic *Salmo salar*, and it does not follow that because attempts to stock rivers with *S. salar* have been so disappointing that therefore failure must follow with the *Salmo quinnat* and other Pacific Coast salmon. As a matter of fact, all attempts to introduce *S. quinnat* into Europe and Australasia have failed.

"The Old Angler will not allow that salmon culture has been successful anywhere. [Here Mr. Marston quotes The Old Angler's letter in issue of March 21.]

"Then followed long letters from Mr. Babcock, Fisheries Commissioner of British Columbia, giving his views as to the value of salmon culture on the Pacific Coast. I confess that in view of the enormous natural production of salmon in those rivers, it is difficult not to agree with the conclusions of The Old Angler, who, at the end of another long letter in FOREST AND STREAM of May 16, says:

From my private and official experience of seventy years among salmon fishermen, and from my observation of the effects of over-fishing in all rivers of New England and eastern Canada, now so visible in the steadily decreasing catch of the Maritime Provinces, I regret to see the same greedy system being pursued on the Pacific Coast and in British Columbia. Mr. Babcock concludes his letter by telling us that "the combined Fraser River and Puget Sound pack in 1901 was 2,400,606 cases of 48 pounds each, making 115,229,088 pounds," which, he says, is nearly half the annual pack of the world. Surely there can be no need of hatcheries on such rivers as these!

If Commissioner Babcock, in view of the experience of Europe and eastern America, covering a period of over thirty years, expects to keep up this enormous catch by means of artificial culture, he is simply chasing rainbows, and I know not which most to admire, his calm indifference to the past history of salmon culture and the lesson it teaches, or his sublime faith in oodles of ova and figures of fry. But I doubt if this last letter will make a convert of Mr. Marston, while I am quite sure that the "scientific gentlemen" will see in neither of them any reason for changing the opinion which a better knowledge of the literature of salmon culture, both in Europe and America, has forced upon them.

"Having elicited these opinions and facts from American authorities, I think it would be very interesting and instructive to hear the views of pisciculturists in Europe, and to see if any facts can be adduced proving that salmon culture is improved and is improving the supply of salmon. I have always supposed that we could at least point to the Yorkshire Esk as a river in which salmon had become extinct which has been successfully restocked, but I am told this is at least doubtful."

Canoe and Camp Life Along the Delaware River.

XV.—Teat Matas.—Two Old ys.

"For tribulation worketh patience, and patience, experience, and experience, hope."

"Friendship—one soul in two bodies."

THERE is a growing tendency, as the sight and taste for nature-beauty become more and more keen, to not only love and be with flowing water, but also with hills and mountains. And there is no better region in which to study all these than here at the Water Gap. After a breakfast in one of the hotels below, it is inspiring to follow the paths and penetrate the nooks of rills and fern-patches, rock and lichens, flower and foliage wealth, and to watch the cloud effects and the winding river, from far up on the sides of Mounts Tammany and Minsi. Nowhere can the Nature-lover realize more fully what I now desire to analyze—the twin musics of the human soul and the nature-soul, and their intertwined being and influence.

It seems, when circumstances are favorable, as if there were no more really young boys than old boys. Close study of two such campers on the Delaware, demonstrates that they could scarcely have had fresher hearts or more gladness in the beauty of earth when they wore copper-toed boots and knickerbockers, than here in their tent about five miles "above" the Water Gap. Here is one of their dialogues:

"Take it, or I will throw it into the river."

"Throw, then! I will not sweeten my coffee with our last lump of sugar."

The small, white cube is split by the blade of a jack-knife; and a half goes into each cup.

"There!" with a growl. "Does that satisfy you? How selfish in you to refuse the whole lump."

An answering growl: "One should have taken the whole or none. You are that one!"

The men are friends, grappled to each other "with hooks of steel" for thirty years. Nearly all of those summers have found them fishing and camping together.

Deaths have occurred in their families. Each has known deadly jousts with untoward circumstances. Despite mutual help; business ordeals have wrenched and scarred them, but the sheet-anchors of iron-true friendship have steadfastly held, always. Many life-battles have been lost, and but few won. Times of light and ease have been displaced by those of unhoused misery. There have been hours of vanity and conceited self-praise at success, and others that saw within their breasts the ghastly murder of hopes and yearnings. Hours when the tides of some great crisis for them surged and demolished, when souls were whipped with scorpions and tried by flames, when palsied hands were lifted to skies of brass, and the sufferer felt like "tearing off the bandage and turning face to the wall!" And then the other steadfastly encouraged with help, and brave, hopeful words, so grateful in times of dire need.

Both are vigorous, resourceful, fairly contented, and always up to the elbows in business when at home. Here it is different. Watch and hear them this July night.

There is no moon, but the sky is bespangled. Hills have lost themselves in twilights. Forest shadows are deep, and advance, but are driven back as flames dance over the log behind the camp-fire. Bellowing voices from a distant convention of bullfrogs! Cries and an occasional boom from invisible nighthawks aloft! Fireflies in a meadow across the river! Far-away hoots of owls on the mountain down that other shore! Voices of the river are growing more distinct. Strange forest odors! Lazy stir and whisper of foliage! Dull, dim lustre cast over all by occasional flashes from low-lying clouds in the west, the faint pink of whose domes swiftly changes to purple and dark blue! An hour ago they saw the white head-stones shining in the sun, around the little church on the mountain across the river. Now they have faded from sight.

The replenished camp-fire, whose lights can show unearthly lines and expressions on the human face such as no other light discloses, has been merely smoking, its vapors lazily mounting through the leafage; but now it blazes up, showing two tanned, healthy, rugged faces below shocks of gray hair.

The supper of fried fish and bacon, roasted potatoes,

big crackers, cheese and apples, has been eaten; frying-pan and kettle are cleaned and "hung up" on convenient stubs of low limbs. The two tin plates, bone-handled knives and forks, and pewter spoons, are washed and "put away" in the soda-box.

"Get out the pipes while I fill the bottle with spring water."

"Nonsense; I go along!"

Two unshaved old fellows in coarse camp clothes and old straw hats lie at full length on the gravel, and drink.

"Cigars to-night. The boy brought a dozen from Stroudsburg."

"All right. Which will you have, camp-stool or mattress?"

The intermittently brightening ends of the lighted cigars, and the smoke from them, are added to the fire and smoke of the camp. Then, a long silence. The fire gets to the heart of its wood, burns more fervently, and they hitch their seats away from it. Another silence.

"Great! ain't it, Bill?"

"Sure!"

"Regular old-fashioned rest and comfort!"

"Sure. Gimme a light."

To many and many a sportsman this camp-fire comradeship is the closest tie on earth. Men in town say they "know" each other. They should camp, and hobnob. There are no white collars and patent-leathers, no easy chairs of plush and leather, no deft servants, no walls frescoed by man. Even in camp, no two men can actually know each other, for no man really knows himself.

"Wondering chiefly at himself;
Who can tell him what he is,
And how join in human elf,
Coming and past eternities?"

But by the evening camp-fire, the great tides of such a friendship as this, powerful, unestranged, borne onward

ate of the manna showered down upon those who lovingly work for others.

But the gypsy nature is inherent in each man. Here, as in town, necessity for each other has grown and ripened through all the slow years.

As they fish or eat together in broad daylight, each would deny this with a jest. But here by the evening camp-fire, the full light of that necessity is tacitly admitted. There are shining traces of it in the unconscious watchfulness for and anticipation of each other's needs, comforts, wishes; and swift meetings of eyes that have noted each other's steps through half a life-time.

There is no human tie more close than this, binding old tent-mates. And how they talk! Old joys, old sorrows, plans for the future, and achievements to be struggled for honorably man to man, are vividly summoned by memory and ambition.

The joys of the day's angling and canoeing are lived over again. How quickly night has come! How surprised they were to hear the bells at the farmhouses calling men to dinner! The afternoon trains had seemed hours ahead of time!

Some night disturbance has set the unseen water-fowl over in the lagoon all a-cry, and babblings and quackings float to them on the night air. Low, ominous rumbles from over far western woods, where a storm is gathering. Silence again.

"Have another cigar?"

"Nope—time for bed. An' say, Bill!"

"Well."

"Don't you make a fool of yourself about me. It might make you sick. Let your family stay at the Gap, an' don't you jine 'em."

Squeaky protests from the rubber mattresses, as they pull the blankets up to their chins. Bill soliloquizes:

"An' I'm going after that miserable bass agin the first thing after breakfast."

MTS. MINSI AND TAMMANY.

by like tastes, sympathies, and joys of their common daily and nightly lot, encompass them like the camp-fire's light. Life which engulfs both is the same to both. They sleep in the same tent, fish in the same canoe, eat and drink from the same rude dishes; and as the night comes on they are separated only "by a step or two of dubious twilight," which the camp-fire almost dissipates.

They are not "good" men. Neither is a church member. They believe and rejoice in the unrest which has built nations and navies, cities and schools, factories and transportation lines. Like all active men, each "has the devil in him bigger than a barrel!" Grown-up boys, their hearts young! Each, with such insight as has been given to him, gropes for truth, wondering, meanwhile, why God sent trouble into the world—that old question that almost drove Goethe mad, and made him write "Faust."

They have been nature-students, always with a growing sense of their own weakness and littleness. Both are well down on life's western slope.

And each is a miniature counterpart or mirror of this Nature he loves so well—Nature "with all her vast contrivances of charm, her grand procession of the seasons, her many musics of loud diapasons, and low babblings, and clear, wild trills of bird-notes; her seas and lands, her cloudy splendors, her glancing lights and shades and darkling closes, her cold and snowy exaltations, and the warm mother's breast she keeps for her tired children."

Both these men have sinned, have sometimes been drunk when oppressed with burdens too heavy to bear. Yet both have had the hands of practical charity, have lifted up and cheered those fallen by the way—waifs with pinched faces and bowed forms and tottering steps; and thus they have found constant resurrection of peace through work for others. They can be profane, but are ashamed of it. They have stood beside tired wives and mothers busy with household duties and mercies, and have held the hands of trusting children, "life's tenderest appeal to a man's fainting heart." And thus "the charmed cup of love and sacrifice never once ran dry," and they

"Stop your talkin'. What's that? Don't I believe we shall have a canoe and a tent, and a river with bass in it to catch, when we get to heaven? How do you ever expect to get in there?"

"St. Peter was a fisherman."

"Well, he knows, right now, how you swore when you lost that big one to-day. Good night."

"Good night. Keep to your own side of the tent; you shoved me clean through the side last night. It's goin' to rain, an' I want half these inside premises."

"All right. If yer old bones get cold, just reach over an' take my extra blanket. I can't spare you either before the camp grub is et."

"Better tend to your own roomatiz. Stop talkin'. This is a sleepin' tent. How good the mattress feels!"

The camp-fire burns low, and is put out by the heavy rain that pounds on the tent, unheeded by the sleepers. It washes the exposed frying-pan and skillet a second time, and is followed by strong winds that start all the forest into a masked-ball dance. At five o'clock a frowsy, gray head is poked through the tent-flap, and a tanned face with keen, kind eyes, takes a quick survey of the morning world under renewed sunshine. Cautious emergence from the tent, still gathering of dry wood, and the fire is renewed. He fills the small kettle, drags six potatoes from the bag, and puts them into the yet cold water, to "boil." Then he goes to the farm-house a half mile distant, and gets milk, sugar, butter, and two loaves of bread. He walks around the tent on his return.

"Poor old chap! How he does snore! Tired him out yesterday. He certainly is gettin' feeble!"

The coffee-pot is placed on the fire, and there is a savory smell of frying fish and bacon. He shakes himself.

"Blamed if I am hardly awake yet. These farmers certainly do get up early. That one over there has milked, and driven seven cows to the pasture-lot on the hill. An' Bill not up yet." A tremendous yawn, and a shout: "Bill!"

A sleepy protest from the tent.

"Breakfast ready. Git up an' put on yer dress suit."

Paid a boy fifteen cents down the road here fur a lot o' hulled wild strawberries. Git now, you lazy! You made a fool o' me last night, an' then snored till mornin'. Looks like a good day fur fishin'!"

A chuckle and gray head emerge from the tent together.

"So it was no dream. You really did kick me in the side. Never mind—I'll tie knots in yer shirt when we go in swimmin' after dinner."

Tent mates! Their fondness for each other is strong as ever; but it will be held in check, and not permitted to run riot, as it did last night under the stars and beside the witching camp-fire. Not many more leaf-falls before they will have a longer sleep, side by side, in the center of that long reach of the double family lot in a Brooklyn cemetery where two little, white head-stones already stand at either end.

L. F. BROWN.

"The Brook."

TENNYSON never got his inspiration to write "The Brook" in Pike county, Pennsylvania. "Lawns and grassy plots" are singularly missing, while "sweet forget-me-nots" would have consisted largely of black and blue spots with "now and then" a fracture. More "like the giant refreshed with wine" are these streams at high tide, majestic in their beauty, dangerous in their fancy. Yet here are found the luscious trout and "now and then" an angler.

Up there "we slumber under moon and stars" (only) one needs X-rays in addition to "netted sunbeams" to be anywhere sure of his footing, and even then he would find that gay and festive colorings are sometimes deceiving.

Mr. Kenneth Fowler and I had talked about the Levis Branch, the Broadhead, Goose Pond Run and tributaries over our lunch for two weeks, until our meat tasted fishy, and we determined that there was but one cure for the well-known disease, so we went. In Hoboken he introduced me to Mr. Henry Chesebro, his brother-in-law, a factor at home, a factor at the Chester Military College, and the real thing on a fishing trip. En route this little soldier showed his indifference to excitement and dangers by going to sleep, while we of more tender discipline though riper years, examined flies, reels, lines, rods, and allowed our imaginations to distance a fast train.

Henry, my old guide, met us at Cresco, and here was discovered a duplication of names, which in a party of four would never do. Somebody had to assume an alias, and it was up to the two Henrys. Hen, Henry, Hank; certainly a pretty bunch to choose from; imagine Hen or Hank in the Hall of Fame or on a tomb stone; it would never do; so we called our soldier boy Colonel, and our good Henry remained entirely himself.

Monday morning, June 22, was really notorious for its sunbeams, a novelty rare; it gladdened the heart and quickened the pulses, it hurried our footsteps over craggy paths and cover toward Long Meadow three miles away. A glad and rollicking song broke forth from Fowler, the birds chirped in gladness as we "hiked" along Indian file behind Henry. The laurel in full bloom hemmed our passage, assuming all its natural beauty, and more, a frightened frog plunged from a foot bridge, bidding us go on, go on, until with a charge sufficiently brave to annihilate any army, we break from cover and storm the meadow.

"With many a curve my banks I fret,
By many a field and fallow."

It was here we had introduced to our creels the perverseness of things. I whipped that brook at long distance for three mortal hours without a rise, while Fowler did the same thing at the other end with like results, while the Colonel in his "freshman" experience, let float along a squirmer.

We met at the bridge, and smoked and watched the sunbeams penetrate the bottoms, while Henry told of taking six trout that weighed five pounds from that brook only four days ago, but it was a rainy day then. Oh, that the canopy of heaven would engulf us once more.

"Well," said Fowler, "we'll give it one more try."
"Back to your stations," says the Colonel, and we scatter. Shortly Fowler is seen struggling and Henry going to his rescue. I am just far enough away to hear, "Fully a pound." "Yes, that much, sure," and then I see the Colonel pulling for the woods with rod erect and teeth shut, and I hear a line of talk I have just forgotten, and—"he got off in the grass."

My wrist aches, but still the flies go whizzing through the air and are drawn along at a hop, skip and a jump. Still nothing doing. I come to the bridge and give it up, and in crestfallen silence await my friends.

Fowler came in with a fine one, the Colonel had lost a finer one. I looked at Fowler's line to see the assortment of flies he was using, and discovered a plain No. 6 hook. We began "roasting" for lunch and dinner right there. I was accused, but proved an alibi by forgetting my hooks when I left home that morning, but it didn't take me long to borrow one from my more thoughtful friends; they all had them.

Henry now led the way to Goose Pond Run, two miles away, and here we took to the water. Goose Pond Run was above its normal condition, in its stillest moments. Prose should be used in describing it, and especially so from its center. It is pretty, grandly so. It rushes and gurgles along over boulders and falls, plunges here and roars there, forming, however, many nice pools for trout, but they cannot be taken by a Christian with flies, both would be lost in the first half mile.

"You slip, you slide, you gloom, you glance
On the rocks
At the bottom of the river.
You thump, you bump, you take a long chance
On the rocks
At the bottom of the river."

Early in this game of athletics I filled my waders and spoiled my tobacco, yet wearied not. Occasionally a trout of goodly size was taken, each of us get-

ting his share. Through gorges, over falls we slide on. At a beautiful break just beyond a ravine, a trail crosses, and here we rest and take lunch.

At 4 P. M. Henry tells us that it is less than three miles by a short route back to that meadow, and that he is sure that as the evening shades gather over the famous meadow, the trout will assume the aggressive, and that it will pay us to go back. We think so, too, and once more the line of march is taken up. Three-quarters of an hour later we again enjoy the peace and quiet of the mountain basin. The timber on the west side appeared in gigantic proportions in long shadows; the crickets clattered and chirped; the frogs croaked their loneliness; swallows skimmed along after their evening meal; the bees were leaving for home; the flies skimmed languidly along the surface, and from weariness alone, I presume, we attacked that brook as quietly as Indians in quest of prey.

"We wind about and in and out,
With now and then a shiver."

At last the stillness is broken, the Colonel has hitched to another big one, with thirty feet of slack line and a single action reel. He sticks to the reel. I call to him to take in the slack by hand; he mistakes my advice and starts for the woods. Again the rushes do the trick, and the Colonel loses another. Loosened belts and tinted skies remind us of a long day well done, and we pull for home. When there we discover that our years belong to time, our grades of fatigue were best measured by our years, and I was the oldest.

Early next morning a drizzling rain set in, and while we were at breakfast some one suggested that this was just the morning to tackle the meadow, but I fancied the Levis branch, a half mile away, being more sensible than ever of life's obligations to time, and time's sore way of collecting its debts.

"By thirty hills we hurried down,
Or slept between the ridges."

Until we were at the foot of the beautiful Levis falls. Here we take to the stream, the Colonel using my waders (they were too small for me this morning). The day before military breeches and baseball shoes had been his attire. At the top of a 6-foot fall the Colonel started across to reach a pretty pool opposite, but his legs carried too much sail, and his legs, boots and all swamped. He dexterously caught a rock, his ready smile from his submerged position assured us that he was quite comfortable, and he got to the other side and fished his pool. A bit further down Fowler's feet tried to exchange places with his head, and only the fact of his waders and "bib" being all one affair, saved him from walking in two barrels of water. And then came my turn again, and I took to the rocks on hands and knees, and the rest of my tobacco was out of business. Rain! How it rained. A ducking didn't hurt. We were getting it from above and below.

"We chatted over stony ways,
The speckled beauties to discover,
Until those days, of all our days,
Were too soon past forever."

"Wet to the skin" is sometimes a misnomer, but it was not in this case; even our hats were leaking. But the ardor of our party was not even damp. We plunged on, the Colonel blue around the gills; but still he sang "White Wings" and "Home, Sweet Home," while the streamlets trickled behind his ears. Fowler sat on a rock and rendered a selection from "Toreador," while Henry seemed to understand the screeching of my soul, "Let's go home," and suggested the danger of pneumonia.

I like to recall the spirit of my companions on this occasion, singing "There's no place like home," while climbing these wet and slippery mountain sides; the Colonel only ceasing in his melody when he fell down, and Fowler never lagging for any cause. Times were a trifle disappointing but never dull.

Sensations intensify in retrospective moments. More vividly each day do I recall lying on my back close to a tall tree and putting my waders up its trunk to empty them of water. I'll take 'em off next time.

T. E. BATTEN.

Sewage Effluents and Fish Life.

In a lengthy and important report on certain experiments carried out to ascertain the best methods of sewage disposal applicable to the county of Worcester, which was laid before the council of that county on Monday, several pages are devoted to the effect of crude sewage and the effluents of three systems upon fish life. Trout and gold fish were first placed in a glass vessel (capable of holding 10 litres of water) with a known volume of sewage or sewage effluent as the case might be. In the crude sewage and water the trout were nearly dead in about ten minutes, the gold fish suffered less. Similar fish placed in the mixture, which had been first well shaken to aerate it, suffered less, going to prove a statement often made of late years that it is absence of oxygen rather than the poisonous properties in sewage which is so injurious to fish. At the same time fish can be and are poisoned in the ordinary sense of the word by discharges from chemical works and the like.

The next experiment was to place the fish in effluents from the three systems known as the septic tank system, the upward anaerobic bed system, and the contact bed system. As regards the first effluent, which was very deficient in oxygen, the effect in each case was more injurious to fish than the crude sewage. The trout, if only left in it for a few minutes, were apparently dead, and attempts to revive them in fresh water failed. The gold fish suffered less. However, in what is termed the "final effluent" of the three systems, provided the bacterial beds were in good order, trout existed in the effluent for some time. Gold fish existed in a mixed effluent coming from the three systems for over one month without any ill effect. The conclusions drawn are that (1) The final effluent of the three systems may not destroy fish life so far as gold fish were experimented on, if the beds are in good working order; (2) that the injury to fish life is usually

owing to the lack of oxygen in the effluent; (3) that the salmon family require more oxygen than the carp family; (4) that it is unsafe to allow an effluent from a sewage system dealing with domestic sewage to pass into a river containing salmon, trout of any kind, or char, which is stated to be innocuous to fish life unless the facts of the case and the kind of fish experimented on are known. It is interesting to note that the committee responsible for the report show a preference for the septic tank system, and consider that domestic sewage, i. e., sewage which contains no waste materials from manufactories, can be satisfactorily purified by its means.—London Field.

A Mysterious Monster.

SEATTLE, Wash.—Editor *Forest and Stream*: While operating a fishery on Admiralty Island, southeastern Alaska, last summer, my attention and the attention of the fishing crew were almost daily directed to a large marine creature that would appear in the main channel of Seymour Canal and in our immediate vicinity.

There are large numbers of whales of the species rorqual there, and the monster seemed to be their natural enemy. The whales generally travel in schools of two or more, and while at the surface to blow, one would be singled out and attacked by the fish, and a battle royal was soon in order.

It is the nature of the rorqual to make three blows at intervals of from two to three minutes each, and then sound deep and stay beneath the surface for thirty or forty minutes.

As a whale would come to the surface, there would appear always at the whale's right side and just about where his head would connect with the body, a great, long tail or fin, "judged by five fishermen and a number of Indians after seeing it about fifteen times at various distances," to be about 24 feet long, 2½ feet wide at the end, and tapering down to the water, where it seemed to be about 18 inches in diameter, looking very much like the blade or fan of an old-fashioned Dutch windmill. This great club was used on the back of the unfortunate whale in such a manner that it was a wonder to me that every whale attacked was not instantly killed. Its operator seemed to have perfect control of its movements, and would bend it back till the end would touch the water, forming a horseshoe loop, then with a sweep it would be straightened and brought over and down on the back of the whale with a whack that could be heard for several miles. If the whale was fortunate enough to submerge his body before the blows came, the spray would fly for a distance of 100 feet from the effect of the strike, making a report as loud as a yacht's signal gun.

What seemed most remarkable to me was that no matter which way the attacked whale went, or how fast (the usual speed is about 14 knots), that great club would follow right along by its side and deliver those tremendous blows at intervals of about four or five seconds. It would always get in from three to five blows at each of the three times the whale would come to the surface to blow. The whale would generally rid itself of the enemy when it took its deep sound, especially if the water was 40 fathoms or more deep.

During the day the attack was always off shore, but at night the whales would be attacked in the bay and within 400 yards of the fishery.

I do not know of any whales being killed, but there were several that had great holes and sores on their backs.

Questioning the Indians about it, I was told that there was only one, that it had been there for many years, and that it once attacked an Indian canoe and with one stroke of the great club mashed the canoe into splinters, killing and drowning several of its occupants.

Will some interested reader of *FOREST AND STREAM* name and classify this marine monster for me?

CAL. H. BARKDULL.

Black Bass Fishing in Walker Lake.

SAN FRANCISCO, June 27.—Walker Lake lies in Esmeralda county, Nevada, 10 miles north of Carson City. It is about 30 miles long, with an average width of 8 miles. On the south and west sides of the lake is the Mount Cory Range, a range of mountains from 10,000 to 12,000 feet high. On the east and north lie the Gillis mountains, from 6,000 to 8,000 feet high. During the hot summer weather thunder storms are prevalent in the Mount Cory Range, and the wind comes down the canyon in severe squalls, which makes it at times somewhat unsafe for small boats to be on the lake.

Black bass were first discovered in the lake about thirteen years ago, their presence there being due entirely to an accident. Some sixteen years ago a farmer in Antelope Valley had a private pond, in which he planted black bass, a cloud burst occurred in that canyon, which washed out the pond, and carried the fish to Walker River, thence to the lake, a distance of 50 miles, where they have increased most wonderfully. The fishing season commences in June. June, July and October are the best months. August and September being out of the question on account of the heat. The fishermen who fish in this lake are principally the residents of the neighborhood. The lures used are trolling spoons, the artificial minnow painted to look like a trout, and the P. & S. ball-bearing bass spoon. Fly-fishing is almost unknown, probably for the fact that the fish taken are more for food supply than for sport. A few, however, have been taken on a fly in the first week of June, fishing from the shore where the water is deep.

Dr. C. E. Reed, of Hawthorne, writes to me as follows: "I almost hate to give you the record of catches made here, for you will say it is a fisherman's yarn. When fishermen go out for the afternoon fish they never think of taking a fishing basket along, they take a barley sack with them, and it is no unusual thing

for one man to catch a sack full in an afternoon's fishing, when they are biting. One man, whom I know to be perfectly reliable, tells me he caught 138 pounds in two hours, from 1 to 5 pounds each. What do you think of that?

"Anglers who wish to come here will have to bring boats (canvas folding boats the best). There are only two boats here, one, I think, can be rented, the other cannot. I forgot to say that Walker Lake is a part of the Walker River Indian Reservation, and one cannot leave a boat or anything else, as the Indians will get away with it; they take everything in sight."

There are also silver trout in this lake, and some years ago salmon from 10 to 25 pounds. No salmon, however, have been taken for the past 6 or 7 years, the bass are supposed to have destroyed them.

To reach Hawthorne, Nevada, coming west, stop at Reno, and change to the Virginia and Truckee Line to Mound House, again change to the Carson and Colorado Narrow Gauge to Hawthorne. Hawthorne lies four miles south of the lake. Excellent accommodations may be had at the Lake View House, and teams can be hired to take parties to the lake.

JAMES WATT.

Rockefeller vs. Lamora.

Full Text of the Opinion, Appellate Division of the New York Supreme Court, June Term, 1903. William Rockefeller, Appellant; Oliver Lamora, Respondent.

Appeal by the plaintiff from a judgment of the County Court of Franklin county in favor of the defendant, dismissing the plaintiff's complaint, at the close of the evidence, entered in the Franklin County Clerk's office on the second day of January, 1903; and also from an order bearing date the 10th day of December, 1902, denying the plaintiff's motion for a new trial made upon the minutes. Kellas & Genaway, for appellant. Saunders & Saunders for respondent.

HOUGHTON, J.

The plaintiff is the owner of about 50,000 acres of Adirondack forest lands, being the greater portion of townships 16 and 17 in Great Tract No. 1 of Macomb's Purchase, in the southern part of Franklin county.

The St. Regis River, which flows northwesterly into the St. Lawrence, has its source, in three branches, in this vicinity. What is termed the Middle Branch rises in the St. Regis Lakes situate in township 18, which joins township 17 on the east, and flows for several miles through the plaintiff's lands. On the easterly side of township 17 is a considerable body of water known as Fallensby Junior Pond. Its inlet is from Slush Pond, situate on the westerly borders of township 18, and its outlet empties into the Middle Branch of the St. Regis River on plaintiff's land. In the southwest part of the township is a pond known as Bay Pond, the outlet of which flows into the West Branch of the St. Regis River, which does not join the Middle Branch for many miles after leaving the territory owned by the plaintiff. In the northeast part is located Quebec Pond, the outlet being Quebec Brook, which flows northerly off the lands of plaintiff and eventually joins the Middle Branch a considerable distance beyond the borders of his tract. A small tributary, known as McCullum's Brook, rising on another township, empties into Quebec Brook just south of the north line of township 17.

The plaintiff completed the acquisition of his lands in the spring of 1899, and immediately began the establishment of them as a private park for the protection or propagation of fish, birds and game by the publishing and posting of the notices provided by Article IX. of the forest, fish and game law as then existing. Since that time the entire tract, except about twenty-five acres cleared for a camp near Bay Pond, has been devoted to the uses of a fish and game preserve. The plaintiff engaged and has kept employed, men to look after his lands and to preserve them from trespass. English deer were imported and turned loose among the native deer, both of which have been fed during the winter when occasion required. Fish, birds and deer have largely increased since the establishment of the park.

In April and May, 1902, the defendant, on three several occasions, entered upon the plaintiff's lands and fished in the Middle Branch of the St. Regis River. He knew of the published and posted notices, and, in addition, had been warned by the plaintiff's keepers not to fish upon the plaintiff's lands because it was a private park. He caught and carried away a number of trout on each occasion.

The plaintiff thereupon brought action in justice's court against him, to recover the penalty in the form of exemplary damages, prescribed in section 203 of the forest, fish and game law. The defendant justified his trespass on the ground that the waters on and running through the plaintiff's lands and pretended park had been stocked with fish by the State, and that hence the plaintiff had no right of action for the penalty in the form of exemplary damages against a citizen fishing in such waters.

That action resulted in a judgment for the defendant, and the plaintiff appealed to the county court of Franklin county for a new trial, which resulted in a direction of a verdict for the defendant, at the close of the evidence, and it is from that judgment that the plaintiff appeals. On that trial the plaintiff established the facts hereinbefore stated, and the defendant sought to prove the stocking of the waters by the State in justification of his acts.

Errors were committed on the trial in the admission of unproved documents and letters, but this court puts its decision on broader grounds. The vast sums of money expended by individuals and clubs in establishing and preserving private parks in the Adirondacks, and the great interest which the citizens of the State have in their rights to the pursuit of pleasure and health in that region, demand from the court a broad interpretation of the law.

The provision of law with respect to establishing private parks, in force in 1899, contained in section 212 the following limitation:

Provided, however, That all waters heretofore stocked by the State, or which may hereafter be stocked by the State from any of the hatcheries, hatching stations, or by fish furnished at the expense of the State, shall be and remain open to the public to fish therein the same as though the private park law had never existed. But nothing herein contained shall be construed as affecting any rights now existing of persons owning lands or holding leases of private grounds, waters or parks prior to the passage of this act.

For the purposes of the discussion of the case, it will be assumed that the defendant proved that the witness

Dwight, between the years 1891 and 1894, not being the owner of the lands or having any fishing rights in the streams, and without the consent of the owners, stocked the inlet of Fallensby Junior Pond with speckled trout fry procured by him from the State hatchery and hatched at the State's expense; and that he also stocked, in the same manner, with lake trout and speckled trout fry, the inlet of Bay Pond; and that such fish were furnished by the State Fish and Game Commission, on his request, they knowing where they were to be placed. Also that the witness McNeill stocked before 1899 McCullum's Brook with speckled trout fry, under the same circumstances and under the same conditions.

This state of facts did not, we think, justify the defendant in his trespass nor authorize the court to direct a verdict in his favor.

It will throw light on what the Legislature could do and intended to do in the passage of the parking law, to investigate the right of the individual owners of the land and the people at large.

As early as the Year Books it was the common law of England that a right to take fish belonged so essentially to the right of soil in streams where the tide did not ebb and flow, that, if the riparian proprietor owned upon both sides the stream, no one but himself might come within the limits of his land and take fish therefrom. And the same rule applied so far as his land extended, to-wit, to the thread of the stream, where he owned only upon one side. Within these limits his right of fishery was held to be sole and exclusive. (Washburn's Easements and Servitudes, 411.) The right to hawk, hunt, fish and fowl was held to be such an interest in land that if it was intended to be more than a present personal privilege, it must be evidenced by a grant. (Wickham vs. Hawker, 7 Mees. & Wels., 63.) And this interest thus acquired was such that the owner of the fishery upon the lands of another might maintain action for trespass. (Holford vs. Bailey, 13 Adol. & El., 425.)

The soil of navigable tidal rivers, so far as the tide ebbs and flows, was prima facie in the crown, and the right of fishery therein was prima facie in the public. But the right to exclude the public therefrom, and to create a several fishery without grant of the land, existed in the crown, and might lawfully have been exercised by the crown before Magna Charta, and could be made the subject of a grant by the crown to a private individual. (Malcolmson vs. O'Dea, 10 H. L. Cas., 593.) Notwithstanding Magna Charta, the king still retained the right to grant the soil under navigable waters, and with it the exclusive right of fishery. And this right, exercised through the Colonial Governor and Assembly, has been recognized by our courts in confirming the title of the town of Brookhaven, and other towns on Long Island, to the exclusive right of fishery even in an arm of the sea. (Trustees of Brookhaven vs. Strong, 60 N. Y., 56; Hand vs. Newton, 92 N. Y., 88; Rogers vs. Jones, 1 Wend., 237; Robens vs. Ackerly, 91 N. Y., 98.)

In this country the State has succeeded to all the rights of both crown and Parliament in navigable waters and the soil under them. In England, Parliament had complete control over all the navigable waters within the kingdom. It could regulate navigation upon them and could authorize exclusive rights and privileges of navigation and fishing. (Langdon vs. Mayor, etc., of the City of New York, 93 N. Y., 155.)

The State, through its Legislature, may exercise the same power which previous to the Revolution could have been exercised by the king alone, or by him in conjunction with Parliament, subject only to those restrictions which have been imposed by the Constitution of the State and the United States. (Lansing vs. Smith, 4 Wend., 9.)

It is probable that section 18 of Article III. of the Constitution would prohibit the Legislature from granting to any individual or association the exclusive right of fishery in any of the navigable waters of the State, for such a grant would be in the nature of an exclusive privilege or franchise. (Slingerland vs. International Contracting Co., 43 App. Div., 223.) And if the State had any title to the fish, birds and game on private lands, the Legislature could not give away that title to an individual or association seeking to park a particular territory. Doubtless the Legislature had something of this in mind when it repealed Chapter 623 of the laws of 1887, which provided that when any territory should be dedicated and designated as a private park, all fish, birds and game should become the property of the owner, or the person or corporation having the exclusive right to shoot, hunt or fish thereon. But such a grant was not a necessity, for the proprietors of the soil through which non-navigable streams flow have the exclusive right of fishing.

As early as the case of Hooker vs. Cummings (20 John. Rep., 90), it was held that in all rivers of the State not navigable in the sense that the tide ebbs and flows (except the Hudson and Mohawk rivers, to which a different rule has been applied by reason of the terms of the grants), the proprietors of the soil through which a stream flows have the exclusive right of fishing therein—applying the rules of the common law of England to their full extent in that regard. This case has been often cited with approval, and has become one of the leading cases illustrating the rights of riparian owners.

In Chenango Bridge Co. vs. Paige (83 N. Y., 178), the doctrine is reiterated that the bed and banks of a fresh water river where the tide does not ebb and flow are the property of the riparian proprietor, who may use the land or water of the river in any way not inconsistent with the easements of the public for passage, as on a public highway.

In Smith vs. City of Rochester (92 N. Y., 485), it is said that the Legislature has no more power over fresh water streams of this character than over other private property, except for the purpose of regulating, preserving and protecting the public easements.

In the present case there is no claim that the Middle Branch of the St. Regis River is navigable for any purpose or in any sense. The plaintiff is the owner of the soil on both sides of the stream and of its bed, as well as of the various ponds and streams which are claimed to have been stocked with fish from the State hatcheries.

Further citation of authority and illustration that when the plaintiff became the purchaser of the land and the beds of the streams and ponds, he prima facie had the exclusive right of fishery therein, is futile and unnecessary.

What, then, was the intent of the Legislature in enacting the parking law? Clearly, we think, only to give one complying with its terms protection to his private rights and the right to recover a penalty in the form of exemplary damages in addition to the actual damage sustained by trespass.

Article IX. of chapter 488 of the laws of 1892, as amended by chapter 319 of the laws of 1896, being the law in force when the plaintiff established his park, provided as follows:

Section 212. Laying out grounds for private parks.—A person owning or having the exclusive right to shoot, hunt or fish on lands, or lands and water, desiring to devote such lands or lands and water, to the propagation or protection of fish, birds or game shall publish in a newspaper printed in the county within which such land or lands and water are situate, a notice, once a week, for a term not less than four weeks in the county where the lands so described are situated, substantially describing the same and containing a clause declaring that such land or lands and water will be used as a private park for the purpose of propagating and protecting fish, birds and game. Provided, however, That all waters heretofore stocked by the State, or which may hereafter be stocked by the State from any of the hatcheries, hatching stations, or by fish furnished at the expense of the State, shall be and remain open to the public to fish therein as though the private park law had never existed. But nothing herein contained shall be construed as affecting any rights now existing of persons owning lands or holding leases of private grounds, waters or parks prior to the passage of this act.

Other sections of the article provided the kind of notices and manner of posting upon the land, and then followed section 215, which provided as follows:

Section 215. Fish or game so protected not to be interfered with.—Upon compliance with the foregoing provisions for preventing trespassing or for devoting lands to propagation of fish, birds and game, no person shall disturb or interfere in any way with the fish or wild birds or wild animals while on the premises so protected, except with the consent of the owner or person having the exclusive right to shoot, hunt or fish thereon. Whoever shall violate or attempt to violate the provisions of this section shall be deemed guilty of a misdemeanor and shall, in addition thereto, be subject to exemplary damages in an amount not less than fifteen dollars, nor more than twenty-five dollars, in addition to the actual damages sustained by the owner or lessee.

The act did not purport to give the owners of the lands and streams the right to fish and hunt on their own premises. They had that already, and they had the common law action for trespass against any intruder. It is not questioned but that the Legislature could give the right to increased damages for the doing of certain acts if it saw fit. The provision for treble damages for cutting and despoiling trees upon the lands of another, and for forcible entry and detainer, was a part of the Revised Statutes before the enactment of the Code, and the power of the Legislature in that regard has never been doubted.

It may be said, too, that the Legislature had in mind some public benefit to be derived from the establishment and preservation of private parks. The law was passed at the beginning of the agitation for a forest preserve, the primary object of which was to protect the wild lands of the State from devastation, and thereby preserve the waterways of the State. Game preserves could be established only in mountainous regions, and the protection of timber is a necessity to their continuance.

There was saved to the State, to remain open to the public, all waters theretofore stocked by the State or by fish furnished at the expense of the State, or which might, hereafter be stocked; and it is under this provision that the defendant attempts to justify his trespass. But how stocked? The Legislature could not authorize the State Fish Commissioners to enter upon a man's private fishery without his knowledge and consent, and deposit therein fish hatched by the State, and thus convert his property to public use and destroy his private rights. This would be the taking of private property for public use without just compensation. One might own a tract of thousands of acres practically valueless as timber land or for agricultural purposes, and yet of very great value for the establishment of a private park. The defendant contends that the Legislature intended to provide that the act of a stranger, in conjunction with the determination to stock of the Fish and Game Commission, in depositing a few fish hatched at the State's expense in one of the streams on lands of an individual or corporation, should have the effect of dedicating to the public an entire territory, the waters stocked as well as all other waters on the lands, and that the owner and his grantees would be thereafter debarred from converting it into a valuable private park. This would be a more complete destruction of riparian rights than the declaring of a stream a public highway for the floating of logs, without adequate compensation, which the courts have uniformly condemned. (DeCamp vs. Dix, 159 N. Y., 436; Brewster vs. Rogers Co., 169 N. Y., 73.) The owner of a stream could doubtless dedicate it to the public use, as he could his lands to a public highway, but this imports consent on his part and a bargain entered into between him and the public authorities.

Nor do we think that if one pond or stream on a tract of land should be so dedicated to the public by the owner consenting that it be stocked by the State, that the owner would thereby dedicate to the public all the other separate streams and ponds which might be on all the land that he owned. It is true that fish, at certain seasons of the year, pass from one portion of the stream to another. Trout fry placed in a small tributary, as they obtain greater size, work to the main stream, and so up that stream, and may never go back to the original water in which they were placed. But this does not constitute a stocking of the main stream. The language of the statute is, "all waters heretofore stocked." In common parlance, the use of the term "waters," as applied to various lakes, streams and ponds on a tract of land, imports a designation of them in severalty, and in such sense we think the term is used in the statute. Our interpretation of the statute is that the stocking of streams and waters, the beds and adjacent lands of which are owned by an individual or corporation, in order to give the right to the public to fish therein, must be with the consent of the owner or one having a right of fishery therein, and that only the particular stream, lake or pond thus stocked is so made public, and that such stocking does not open to the public streams to which they may be tributary; and that this stocking of such a stream by owners above or below does not have the effect of opening to the public that part of the stream situated on lands of an owner who has not consented to such dedication, and that the public is not permitted to follow the migrations of the fish and take them in that part of the stream on private lands without the owner's consent.

It is urged that the various laws enacted by the Legislature, with respect to the time and manner of taking various kinds of fish and game, are inconsistent with this interpretation of the law.

There is nothing inconsistent between this public regulation and the rights of individual owners. The power resides in the several States to regulate and control the right of fishing in the public waters within their respective jurisdictions. (Lawton vs. Steele, 119 N. Y., 234.) Fish and game are migratory, and those which may now be on private lands may quickly change their location to public lands and public waters. No man owns wild game or fish, even though they be on his land, unless he has reduced them to his possession by capture. If they wander from his premises to those of the public or another, he may not complain of their taking. In public waters and on public lands, this right is open to all alike, and no individual right is trespassed upon by so doing. Fish, especially, form a large source of food supply, and those which propagate upon private property and migrate to public waters may constitute a considerable proportion. That they may not be disturbed in propagation, the regulation of the manner and time of their killing is, therefore, a proper subject of legislative action. As was said by Chief Justice Spencer, in Hooker vs. Cummings, supra: "These acts prove nothing; for the Legislature have, confessedly, the right of regulating the taking of fish in private waters; and do, every year, pass laws for that purpose, as to rivers not navigable in any sense, and which are unquestionably private property."

We have not overlooked the case of the people vs. Hall (8 App. Div., 15), urged upon our consideration by the defendant's counsel. There were many reasons in that case which called for a reversal of the judgment convicting the defendant of the misdemeanor provided by the game law, and the determination of the court could have well been put on those grounds alone. We are forced to disagree with that portion of the opinion which intimates that a private park cannot be maintained under the statute unless proof is given that animals and fish were actually bred and propagated thereon. The language of the statute is, "devote such lands or lands and water, to the propagation or protection of fish, birds or game." It is well known that when fish and game are protected they propagate rapidly. In the present case the proof is that both have very largely increased since the establishment of the park. A protection which allows natural propagation, we think, meets the requirement of the statute.

We are mindful that this interpretation deprives the public at large, by the infliction of severe penalties for infraction of the law, of the pleasure and profit of fishing and hunting in a very large portion of the Adirondack forest, and gives to men of great wealth, who can buy vast tracts of land, great protection in the enjoyment of their private privileges. The wisdom of the Legislature in prescribing exemplary damages, and making fishing and hunting upon private parks a misdemeanor, is not for the court to review. It was within its province to do so if it saw fit. Exemplary damages are no new thing for wilful conduct, and the Legislature is constantly enacting that certain wilful injuries shall be deemed misdemeanors.

The burden was on the defendant to show that the stream in which he fished had been dedicated to the public. The plaintiff being the owner of the land through which it flowed, it was prima facie private property; and upon the plaintiff showing compliance with the statute he was presumptively entitled to recover.

There was no proof that the stream in which the defendant was fishing had been, in contemplation of law, stocked by the State. He failed, therefore, to justify his acts, and by them incurred liability for the penalty in the form of exemplary damages, provided by statute.

The judgment must be reversed and a new trial granted, with costs to abide the event.

CHICAGO AND THE WEST.

Trout in White River.

CHICAGO, Ill., July 1.—Mr. F. W. Pickard, of the Oriental Powder Mills, of Cincinnati, Ohio, whom I referred to Benjamin's place on the White River, Waushara county, Wisconsin, at an earlier date in the season, is good enough to drop a line reporting the results of his trip in that vicinity. He writes as follows: "Personally I fished ten days, some of them short ones, and took about 100 trout, the best being 1¾, 1½ and 1¼ pounds, all three on fly, all rainbow. The largest rainbow caught in the White was 2½ pounds (on grasshopper). The average string was in the neighborhood of 7 or 8. I think, with the exception of my record day of 23, all on fly, and some 12 or 14 (about one-half on fly) taken by a Dr. Williams, no one exceeded 10 or 11 fish.

"I put in one day on the McCann with a friend, and together we took five. I took a 1¼-pound speckled and 1½-pound rainbow, and my friend took a 1-pound rainbow. The others were small. The McCann fish were taken on club bait. There seems to be comparatively few in the McCann, but the average weight runs high.

"The White is being greatly overfished this year. By actual count one meadow was fished fourteen times between 10 A. M. and 8 P. M., and certain portions of the stream are fished from five to ten times practically every day in the week. An eight-inch limit on the stream would do a great deal of good.

"At Benjamin's place their accommodations are very limited, and they have been turning away many people this season. It was rather a disappointment to several parties who came while I was there to find no accommodations ready for them, and I may add that during the rest of the summer practically no one will be taken in unless they have letters from some of the people who have stopped there in other years. They are nice people and all there are finely served."

Hearing what I have regarding the numbers of anglers who have been in this district recently, I am inclined to think that Mr. Pickard was rather fortunate than otherwise. His trout are among the best in weights which I have heard reported from that vicinity. It takes a fisherman to catch trout.

Good Muscullunge.

The impression is growing among the angling fraternity

that Mayor Harrison is what is known as a shine fisherman. On his recent trip to Minocqua he allowed his brother, Mr. Preston Harrison, to catch the biggest muscullunge of the expedition, a 22-pounder, taken in Carroll Lake. This fish was served up in due state at a Wishininne banquet in Chicago, on Tuesday last, June 30, the affair being patronized with great vehemence and gusto by all loyal Wishininnies at present in town and able to attend.

The Passing of the Kankakee.

Some fourteen years or so ago, when I first began to send notes from this district to the FOREST AND STREAM, the marsh country on the Kankakee, in Indiana, was very much in evidence. At that time and for some years thereafter a number of prosperous club houses were maintained at different points on the Kankakee marsh, and few localities in the country offered more attractions to the lover of wildfowl shooting. The abundance of ducks, snipe, plover and the like for a long time overshadowed fishing attractions, although there was a time when the members of some of the clubs, for instance the Maksawba Club, paid a good deal of attention to bass fishing, some very good catches being made on the artificial fly by some of the devotees of the gentler side of angling. For the past few years all these things have been changing. The threatened ditching and draining of the old marshes has gone on, until to-day they show but a shadow of their former quality. To-day I met Mr. Graham H. Harris, who made a hurried fishing trip to the Kankakee last week, and he tells me that the big ten mile ditch has been completed across the old grounds of the Maksawba Club, straightening out the former channel of the river and leaving all the river proper very little more than a series of broken, detached and stagnant pools. In the main river, or main ditch as it ought now to be called, they found no bass at all, and Mr. Harris doubts if there has been a bass taken in that part of the country this season. Of pickerel they took a great many, their success tallying with that of others reported at different times in these columns throughout the present summer. They had of these fish specimens up to six pounds or more. Mr. Harris thinks that as the ditch is only completed recently, and as, indeed, work still progresses at its lower end, there may presently be a time when it will have washed out the sediment down to the gravel which underlies all this marsh country, in which case the stream ought to become fit for bass. He says that he doesn't know what has been done in regard to the long talked of rock-cut through the great ledge at Momecne, which constitutes the great geological dam which has built the historical Kankakee marshes, backing up the mud and silt for more than a hundred miles. It is likely, however, that this cut will some time be made, and the passing of the ancient home of the wildfowl will then be completed. To-day, my friend tells me, they are plowing corn where we formerly shot jacksnipe or built blinds for mallards. The glory of the Kankakee has assuredly departed.

We have had for three days the first actual warm weather of this season, and whether it will be good or bad for the bass fishing no one can tell, probably the latter. Last week the bass began to bite a little bit in Lake Marie, Channel Lake, and one or two waters of that vicinity in northern Illinois. Dr. Lund and party took sixty odd bass in their trip, and reported the sport very satisfactory.

Muscullunge in Gun Lake.

Last summer I mentioned Gun Lake, Michigan, which can be reached via Shelbyville or Bradley, Michigan, at a distance of half a dozen miles or so from the railway station. This lake, a good large one and a very sporting one, drains neither into Lake Michigan nor Lake Huron, so far as my informant can tell me, and yet he says that the muscullunge is not unfrequently taken in these waters, and that one of the local hotel men has the heads of several muscullunge nailed up on trees about his place. My friend thinks that the muscullunge were just left there when the waters of the flood subsided. Perhaps he will find some little creek connecting Gun Lake with some river which connects with something else. As to the authenticity of the muscullunge story, there would seem little doubt, for once there was a *cause célèbre* in regard to a muscullunge which was taken in this very lake. An angler was out fishing before the opening of the muscullunge season, and he caught this fish, not so much of his own motion as of that of the muscullunge itself. The testimony showed that the fish was dead when taken into the boat, but it was not shown that the angler killed the fish. Neither was it shown that he made any attempt to return it to the water after taking it thus against his will. In spite of these facts, and in spite of about \$7,000 spent in pushing the case, the defendant was acquitted by the intelligent jurors of Michigan, who said they thought it was not his fault if the muscullunge fastened itself to any lure which he might perchance be using.

This is the case as it comes to me, but it seems strange law. For the benefit of any who may, without intention, take a fish or other animal at any time or in any manner prohibited by law, I would say that the correct legal thing to do in such case is to restore the fish, bird or beast at once to its original environment.

Chicago Fly-Casting Club.

Mr. Arthur H. Bellows, secretary of the Chicago Fly-Casting Club, issues the following letter of general advice and invitation, covering the long deferred visit of the club to Grand Rapids:

"A cordial invitation is extended to all members of the Chicago Fly-Casting Club to attend the Interstate tournament, to be held at Grand Rapids, Mich., Friday, July 10. After the contests at Grand Rapids, members will participate in fishing trips, to be arranged by the members of the Grand Rapids Club. The fourth club contest scheduled for July 11 has been postponed until July 18, on account of conflicting with the Interstate tournament."

E. HOUGH.

Seining Buffalo Fish.

A NEW sport of unusual interest at Okoboji is that of watching the men seine for buffalo or seeing the large fellows they bring in. Wednesday Elmer Heushur brought in a big sixty-nine pounder while seining in East Lake. Last fall in one day 7,000 pounds were taken out of Minnewasta. Some days they get almost no fish, but often 1,400 pounds come in. The buffalo seem to have no special bed, as often the barge is seen off South Beach, Miller's Bay, Hayward's Bay, Minnewasta, or Center Lake. They get many small fish and often bring in a forty-pounder. The equipment for catching these large fish is very different from anything we are accustomed to seeing here. The net is from eight to sixteen feet wide and 1,000 feet long. At about two feet apart on one of the long sides there are large egg-shaped floats and on the other side are many sinkers of about a quarter of a pound in weight. The flat boat is some fifteen feet long. Near the stern are two uprights on which are riveted two five-foot solid wood wheels. The net unwinds from these wheels. The barge is towed by the Hiawatha to the ground of action. It takes six men to do the seining. Two hold fast one end on the shore while the others row out in a circle dragging the weighted side of the net as they go. After making this detour the other end of the net comes back to shore almost where the first men were. Then the net is dragged in, drawing all the fish to land. No game fish are allowed to be kept, but must be let free again. A deputy attends each party that goes out and sees that this is done. Large orders are filled each week and shipped away. The buffalo have multiplied many fold in the last year, since the law for seining fish has been in force. But this last winter many pounds of buffalo were captured through the ice. They claim that buffalo eat other fish and perhaps that has much to do with the less amount of game fish caught here. To-day as the Okoboji plowed the waters it divided also a school of large fish, both gar and buffalo. One could see the big fellows turn and glide away.—Des Moines Register and Leader.

The Good Record of Protector Williams.

WATERTOWN, N. Y., July 1.—*Editor Forest and Stream:* The prospects for fish and game in Jefferson were never better than at the present time. Large numbers of wild fowl are nesting. There is a noticeable increase in grouse, and the indications are that the bass fishing will be better than usual. These conditions are the result of the active cooperation of the law abiding citizens, the State commissioner and the protectors, in the enforcement of the laws protecting fish and game. It has been stated in FOREST AND STREAM by myself and others that no protector could do good work in his own immediate vicinity. I wish to retract this statement.

In July last Mr. A. P. Williams, of Mannsville, a lifelong resident of this county, received his appointment. Since then he has had 17 successful prosecutions, the fines amounting to \$468, and has two cases not yet settled. Seven of these were for illegal killing of game, the rest for illegal fishing. During this time he removed from the waters of this county 60 illegal nets and 4,000 feet of set lines, valued at \$387. He also has a collection of 500 snares, which he removed from the grouse covers. All this work was done in Jefferson. In addition to this he assisted Protectors Matteson, Pearsall and Hawn in clearing Oneida Lake of nets, convicting two men for seining, securing the seine and a fine of \$100, also capturing 16 trap nets, which with the seine, were valued at \$595.

All of which goes to prove that a protector can do good work if the parties who are interested will give him information, and active support in the performance of his duties.

Not All of Fishing to Fish.

GEORGE HENSHALL, Thomas Henshall, James McGrath, William Thompson, Augustus Hains and Thomas Lyons hired the sloop yacht Florrie B. at Fort Hamilton last Sunday morning for a fishing trip. The boat, an open 30-footer, was caught in a squall off Sandy Hook, and to save themselves the crew had to put out to the open sea. An attempt was made to reach the Atlantic Highlands, but ended in failure. The men managed to get the boat to the pier at Coney Island Thursday morning. According to the men's story they landed at a deserted strip of sand off the Jersey coast on Tuesday, and managed to purchase some raw eggs from a lonely fisherman who lived on the beach. This, together with some bread, was the only thing the men had to eat.—New York Evening Post.

In the New York Aquarium.

THE carp would not commonly be looked upon as a jumper, but rather as a dull and lazy fish more inclined to stay at the bottom; but for all that the carp can jump. There is a carp in the collection that has twice jumped out of its tank. This is a mirror carp, about two feet in length and weighing four or five pounds, that was taken with a smaller mirror carp from the lake in Prospect Park, Brooklyn. The two were placed in a tank on the gallery tier, fresh water side. The smaller of the two was quite comfortable in the tank, the larger one inclined to be restless. Over each of the tanks on this tier there is a screen of galvanized iron wire, with a mesh about like that of a coal sifter, and with an iron rod about an eighth of an inch or more in diameter running around the border to keep the screen in form. The water on this tier of tanks comes up to within eight or ten inches of the screens. The screens keep rats from getting at the fishes in the tank, and are supposed to keep the fishes from jumping out. But the screen over the mirror carp tank wasn't heavy enough to keep the big carp in. That solid and vigorous fish jumped up one day with sufficient force to raise the heavy wire screen high enough to permit it to pass under it, over the edge of the tank, to fall on the floor outside.

In the experience the carp lost out of the upper lobe of its tail fin a section that made in it a right angle notch whose sides were about an inch in length. This piece out of its tail it is supposed to have lost when it went over the side of the tank by the screen's dropping on it; the heavy screen happened to come down on it in the brief instant of time while it was over the edge of the tank, at just the right time and in just the right way to nick that notch out of it.

Back in the tank—the smaller one all the time remaining tranquil as it does—the big carp thrashed about so much that it marred itself in other ways; it knocked off some of its scales and bruised itself so that it was not slightly, and then it was removed to a reserve tank in the corridor at the rear of the exhibition tanks. Here it again distinguished itself by jumping out. The reserve tank is bigger than the exhibition tank from which it was taken. Standing upright on the edge of it all around is a vertical wire screen ten inches or a foot in height. Laid flatwise over the top of the tank, its outer edges resting upon the vertical screening rising from the edges of the tank, is a screen cover made of wire cloth with a frame of wood; this screen lies fifteen or eighteen inches above the surface of the water, but the big carp jumped up against it, raising it by the force of the blow sufficiently, as it had done in the other case, to enable it to jump over the edge. It was picked up again on the floor and once more returned to its tank. A section of plank was then laid lengthwise along the cover, and this is more than the carp can raise; but in its efforts to lift it the carp now and then comes up against it hard.

The big West Indian seal, known at the Aquarium by the attendants as "No. 2," which died recently, was probably the Aquarium's best known exhibit. More persons will remember her and her habit of playing tricks on the spectators than any of the other exhibits. Her tank was always the center of attraction. Notwithstanding the sign which was posted on one end of the tank warning people to keep at the other end if they would not get wet, many were willing to take the chances for the pleasure of watching her. She was discriminating in her choice of subjects for her trick, and showed her intelligence by the subtlety with which she perpetrated it. She would swim about the pool, as if paying no attention to anyone, and, suddenly stopping, turn her head to one side and bark. Her aim was usually good, and the water, about a quart in quantity, reached its mark with startling speed and certainty. It is told of one young man, whose bright necktie became her target, that when the water struck him he was so startled that he fell over backward, and would have fallen to the floor had not an attendant caught him. The seal, seeing him disappear, got up on the ledge of the pool and looked over to see what had become of him.

When the Indians of Buffalo Bill's Wild West Show, dressed in their native costumes and with painted faces, visited the Aquarium, they were greatly interested in "No. 2." They gathered around the tank and watched her as she swam around it, looking up at them in wonderment. Fearing that their bright colors would become the seal's target, they were warned of her joking propensity through an interpreter. On their guard, they watched her swimming about the tank, but she seemed to have no desire to spoil their complexions.

One morning Mr. Spencer was walking about the upper tier of tanks, when he heard a demon-like roar that seemed to come from beneath him. From time to time he heard it in different parts of the building. It always seemed to come from below. Investigation proved that the seal had put her snout down the big pipe in the bottom of her empty tank and was enjoying herself by roaring into it. As the pipe connected with other pipes radiating all over the building, the roar arose everywhere.

She was said to be the only one of her species in captivity. It is doubtful if the Aquarium will have another, as the species is nearly extinct. Two centuries ago they were caught in the Caribbean Sea in great numbers for their oil. About one hundred and fifty years ago they were nearly exterminated. It is said that when the seals, of which "No. 2" was one, were captured, Captain Martin, of the fishing boat that made the haul, did not know what they were when he first saw them. In his search for Pensacola snappers near the Campeche banks one bright day he saw lying on the sand a group of strange looking animals. Landing with several men he approached the herd, which he found to contain from twenty-five to thirty of these seals. They cautiously drew near, but the seals paid no attention to them beyond raising their heads. A number of the seals were taken alive to Pensacola, where they were kept until early next summer. They were caught in the winter of 1896-'97, and brought to New York in June. Three of the number were taken to the Aquarium, and No. 2 was the last of the trio to survive.

"No. 2," lacking intelligent eyes and wit and joking humor, will be stuffed and placed on exhibition in the Museum of Natural History. Nellie, the harbor seal, is

the only seal at the Aquarium now.

In one of the tanks there are a number of specimens of the curious and interesting little Bermuda fish called four-eyes, from a spot on either side close to the tail which somewhat resembles an eye, so that the fish has the appearance of having four eyes. There is a fish of the same family, but of a different species, taken in these waters and called butterfly, that in some respects resembles the four-eyes, though the markings are different. The spots, for instance, that make the extra pair of eyes are not only different in themselves, but in the butterfly are on the dorsal fin, near the tail, instead of on the body. But when two butterflies taken hereabouts were brought to the Aquarium they were naturally enough put into the tank with their relatives from Bermuda.

The two butterflies came two weeks apart. The first one played by itself, not mixing much with the four-eyes, and it might be thought that it would have welcomed a newcomer of its own kind. They do associate together fraternally now, but they did not reach this happy understanding until after a fight, in which the fish that had been longer in the tank and which was the aggressor, had been whipped.

It is not unusual for a fish to hector and bully other fishes in a tank and to chase them about and bite at them, and when a fish persists in this it is removed to another tank. Sometimes when a new fish is put into a tank the other fishes there may worry it for a while, and this comes at a time when the new fish is least able to withstand it, being tired with travel. That is what happened to the new butterfly when it was put in the tank. It hadn't been there long before the older one began to hustle it.

These small creatures are little bits of chaps, not much more than three inches in length, but off and on they fought for half an hour, running at each other and biting at each other, and scuffling about in the corner that they mostly frequent, with the newcomer finally the victor. Now they live in amity and go about together; but they do not go much with the four-eyes, being in this respect like most fishes whose common habit it is, even in captivity, and though they may move freely about, if there is more than one kind in a tank, they keep by themselves, each with its own kind.

There has been added to the sub-aqueous family in the Aquarium a new and interesting species of crab, known, on account of their similarity to the bridgebuilding, tight rope contemporaries of attic and jungle, as "sea spiders."

It will be necessary for the attendants about the place to exercise great care to prevent the new arrivals from preying on the other fish, crustaceans, vertebrates, and all, if one of the keepers, a man whose veracity has never yet been called in question, tells the truth.

This keeper says that the spider of the sea is as dangerous to his tank mates as his many-legged, many-eyed tellow pirate of the land is to the little innocent fly.

"The sea spider," said the attendant, who has an honest face and is a man of temperate habits, "is the flyest pirate that prowls below water. Why, sir, the first night we had a sea spider in the Aquarium we were a bit cramped for space and so we put the fellow, not thinking he was lively enough to do any harm, in the same tank with a small school of scup.

"Well, sir, when I went to the tank the first thing in the morning, what had that 'ere ten-fingered Jack done but spun a web just like a sieve round and round them scup that had sneaked around some rocks in the bottom and laid low for a night's rest.

"The sea spider had spun a long guy and was ready to do the slide-for-life act and pounce upon the fattest of them scup that couldn't move a little bit, when—"

"Avast there, Otto!" shouted the head keeper, "it's time to draw the water from Nellie's tank and give the dear a drink."

Mr. Spencer tells a story about two hard clams that caught a rat apiece in the feed room of the Aquarium recently. A barrel of clams is kept there constantly. The keepers and attendants in the building heard a tremendous racket composed of squeals and scamperings. On opening the door two rats were discovered, one held motionless with a hind foot between the shells of a clam, and another dashing about with a second bivalve tenaciously embracing its tail.

"Jasper," the heavyweight snapping turtle of the collection, won't bite any more little turtle's tails off for some time. He's been chewing at anything that was snapable for a long time, and the other day he got so bad that they had to put him in solitary confinement. He's now in a tank all by himself, to the great gratification of the twenty odd other turtles, for whom he had been making life miserable and more or less tailless for weeks.

Sometimes he used to get so mad at the rest of his fellows that he wasn't satisfied with a tail or a foot. He would try to kill every turtle in sight. Then there would be the greatest thrashing about in the turtle tank, and Jasper in as hot pursuit as a turtle can ever get. The attendants would have to go to the little chaps' rescue, and they finally got so mad at Jasper they just yanked him out from the rest of them and dumped him down by himself, where he can ruminate over the misfortunes of a bully.

"Of all the difficulties with which the amateur photographer has to contend in his search for novel subjects for his camera," said Mr. Spencer, "that of snapping living fish in the exhibition tanks is about the worst on the list.

"To the unsophisticated," continued he, "it seems an easy matter to make a good picture of the larger fishes as they swim lazily about their tanks. The water appears clear and the light seems all that could be desired, and almost every day some enthusiastic but deluded kodak fiend makes the round of the Aquarium snapping the most desirable groups.

"But it is not always the amateurs who are fooled," went on Mr. Spencer. "Quite recently a reporter on one of the illustrated dailies came here, accompanied by a staff photographer, and asked permission to make some pictures to illustrate a story. Of course permission was granted, and although warned as to the fruitlessness of his undertaking, the photographer proceeded with his work, and departed confident that he had several good views, but I was by no means surprised when shortly afterward a messenger dashed in and inquired if I could not loan it same photographs.

"Now, when we wish photographs, we remove the fish from the exhibition tanks to an aquarium specially constructed for photographing purposes," indicating by a motion a group of long and extremely narrow aquariums resting on a table in the laboratory, "and even under such conditions the results are often disappointing, success only being assured under the strongest light, and when the subject is completely at rest.

"One of our greatest difficulties heretofore has been our inability to photograph the living fish in their natural surroundings, for just so sure as we introduce seaweed, foliage, rocks, or shells into the photographing tank, behind these objects the fish would anchor, and they acted generally as if they knew exactly what was taking place or had personal objections to sitting for their portraits. To overcome this contrariness on the part of the fish, we are having built an aquarium fitted with an inner glass slide, in the rear of which can be placed the 'properties' characteristic of the subject. Thus equipped, we will be better able to carry on the educational work which is now being done in our laboratory."

A death of a noted inmate of the Aquarium not long ago was that of Jake. He was a sturgeon, and his full name was *J. chondrostei scaphirhynchops*, of the illustrious old *Actinopterygii* family, but his friends all called him Jake, and he liked it. He was democratic, Jake was.

Jake first saw the subaqueous light of day four years ago in one of the tanks of the New York State Piscicultural Nursery at Bayside, L. I. He never was small fry. From his earliest moments he was a whopping big fellow, fit to take a leading part in fish stories. And how he could eat! Lettuce, parsley, cresses, seaweed and rockweed disappeared in his cavernous midst in bushels and barrells, and his appetite was still on edge. He throve. He waxed fat. He became mighty.

It was Jake's great size and strength that first attracted the attention of Col. "Jim" Jones, then superintendent of the Aquarium. Jones negotiated and Jake came to New York. The sturgeon then weighed 250 pounds, and he was seven feet long.

They put Jake in a lordly tank and he was monarch of all he surveyed. They gave him armfuls of his favorite grasses and weeds. But he tossed the food disdainfully aside and absolutely refused to eat.

What Jake missed was the company of his brothers and sisters at Bayside. Most of all he felt the absence of a dear little *Miss Scaphirhynchoperina*, whom he hoped some day to make his blushing bride—if subaqueous blushes can be managed. Day by day he pined and visibly shrank. Mr. Spencer guessed he was lonesome and put three little sturgeons in the tank to keep him company. Jake's nostalgia took a fatal form. He killed them all.

Poor Jake grew thinner every day, but he might have survived many months more, if certain tales are to be believed, if an eminent professor of natural history hadn't marched a dozen students up to his tank just when Jake was feeling in a bad way. The professor was noticeable for polysyllables and whiskers.

"The sturgeon," he said—and Jake couldn't help but hear him, 'tis said—"the sturgeon form what may be termed a degenerate specialized series characterized by the absence of ganoid scales, also by the more or less completely persistent notochord, by the inferior and superior supporting ossicles (axosts and baseosts) forming a simple and regular series, and by the presence of a pair of infraclavicular plates in the pectoral girdle."

Jake listened to these awful words. They burned deeply into his tender sensibilities. All night he brooded over them, and at daybreak he rolled fin up and gasped his last. He had shrunk from 250 to 169. His backbone showed plainly through his skin. What was left of him was sent to the Museum of Natural History to be stuffed and mounted.

The Willowemoc.

DEBRUCE, Sullivan County, N. Y., July 2.—*Editor Forest and Stream:* I had the pleasure of fishing the Willowemoc to-day for trout, and while it is not the best time of the year for this particular kind of fishing, I had seventy to eighty rises during the day, and succeeded in keeping a goodly number from going back again.

The Willowemoc is the prettiest stream for fly-fishing I have ever seen. It will average twenty-five feet in width with no overhanging boughs, and is singularly clear of brush, the fly-caster can have plenty of room to exercise his enviable talent on the Willowemoc.

The Hearthstone Inn at De Bruce is all that the angler can desire—four o'clock breakfasts, and nine o'clock dinners are served with as unruffled a spirit as at regular hours. Mr. W. F. Royce, the proprietor of the inn, sees to it personally that the angler is made comfortable at all hours.

T. E. B.

Porpoises as a Pest.

CONSUL KIDDER, writing from Algiers, says that among the coast fishermen the question of dealing with porpoises has been a source of anxiety. All the methods of destruction employed—firearms, harpoons, Belot needles, and poisoned baits—have given poor results. The system of giving fishermen an indemnity for the loss of their nets has proved more satisfactory.

The Barefoot Boy.

The barefoot boy is coming, and right now he has the blues. Because his cautious mother will not let him shed his shoes. He's anxious for the freedom of the barefoot boy at dawn, who does not have to bother with the footwear girls put on. He wants to wade in water every morning when he goes to school with other youngsters, and get mud between his toes.

The barefoot boy is coming, and ere long he will be here. With feet as tough and dirty as they could be made, I fear. He'll have stone bruises on them, and will oft be walking lame. And yet you may be certain, he'll be happy just the same. He'll stub a toe quite often, yet a little thing like that Won't faze him for a minute. He'll be Johnny at the bat!

The barefoot boy is coming, and if you were once a boy You know that when we see him we will find him full of joy. He will not mind the bruises! Has not every youngster paid— In injured feet—full value for the chance he got to wade? He will not mind mosquitoes, nor for brier scratches care; And he will sneer at stockings—when his sunburned feet are bare. —J. C. Stewart in Boston Journal.

The Kennel.

Fixtures.

Oct. 6-9.—Danbury, Conn., Agricultural Society's show.
Nov. 3-6.—New York.—Annual show of Ladies' Kennel Association of America.
Nov. 9.—Fourteenth annual beagle trials of the National Beagle Club of America. Charles R. Stevenson, Sec'y.

A Bloodhound Episode.

GANSEVOORT, N. Y.—*Editor Forest and Stream:* Since mailing my brief article on Bloodhounds and Man-hunting, I have read your editorial under the above heading and it prompts me to extend my remarks on the subject.

The Cuban dogs, which were procured to exterminate the Seminole Indians, and only succeeded in exterminating a lot of calves, were not the true bloodhound. The Cuban hound differs in every essential point from the bloodhound proper. They were derived from various crosses of "Pugnaces," or dogs of war, of which the Great Dane and the mastiffs are examples, while the bloodhound was originally cultivated from the olden races of "Sagaces," i. e., sagacious or intelligent dogs.

The name bloodhound was given the breed during the reign of Henry III. The breed originated from the old talbot hound, which was brought over by William the Conqueror. All authorities agree that the talbot was identical with the St. Hubert hound, a breed from St. Hubert's Abbey in Ardennes, which according to old legends, was imported by St. Hubert from the south of Gaul about the sixth century. This is the condensed history of the breed, and the name bloodhound, when applied to dogs of different descent, is a misnomer.

The bloodhound will not tear, or rend the object of its pursuit. On the contrary, when it overtakes such object it simply evinces joy and gladness. The bloodhound will follow the trail of Indians, or any other living creature which leaves a trail.

In size the bloodhound differs as greatly from the Cuban dog as it does in appearance, disposition and intelligence. It stands from 22 to 25 inches high at the shoulder, and weighs from 70 to 100 pounds, while the Cuban dog measures from 30 to 36 inches at the shoulder and weighs from 150 to 200 pounds. I have heard of their weighing as much as 300 pounds. I can find no evidence to show that the bloodhound was ever bred or used in Cuba for any purpose. They are rare even in England, and this seems strange when we consider their many admirable qualities. However, American fanciers are becoming impressed with the true value of the breed, and such breeders as J. L. Winchell, of Fair Haven, Vt.; Dr. C. A. Lougest, of Boston; Col. Roger D. Williams, of Lexington, Ky., and Dr. J. B. Fulton, of Beatrice, Neb., have already raised the standard of its excellence to a higher level than it has ever reached before.

There is only one class of persons who have any reason to decry the use of bloodhounds in tracking criminals, and that class is the criminals themselves, and they have abundant reason. The trained bloodhound is the criminal's Nemesis.

JOS. W. SHURTER.

Unexpected End of a Fox Hunt.

A FEW days ago Pem McNeill, son of Dr. J. W. McNeill, living at "Ardlussa," on Rockfish Creek, seven miles south of Fayetteville, shouldered his gun and set off down toward the mill, followed by a young hound much given to the sports of that section.

A big yellow perch "brake" in a dark, cool eddy of the creek; the maple and bay buds were bursting in russet and green along the edges of the stream; the pungent smoke of burning new grounds mingled with the smell of the fresh plowed earth; and, from the cedar at the corner of an old tobacco barn, a saucy mockingbird was "guying" a swamp sparrow with a perfect counterfeit of his liquid whistle. Suddenly the hound lifted her head, cocked her silky ears, trod more softly along the leafy woodland path, looked up into her master's face, and then swiftly glided off through the undergrowth.

In a little while she gave tongue a quarter of a mile away, plainly on the track of a fox, and the chase could be clearly followed over the hill, down by the hollow, across a neck of woods, and on to Carver's old field. Then the dog's "music" was shut off, so suddenly that it impressed Pem at first; but it passed out of his mind; and, making his rounds, he returned home.

The hound was not back at dinner time, nor that night; and Dr. McNeill, who values her highly, half jocularly accused his son of shooting at the fox and hitting the dog—a charge denied with the natural indignation of a Cape Fear sportsman, that he should be thought guilty of the unpardonable sin of shooting at a fox. Three days passed, with vain search and inquiries all over the neighborhood for the missing dog; and on the fourth morning Pem McNeill, recalling the fact that the hound ceased her "music" about the Carver old field, set out with a companion for that spot.

There, in a dry well twenty-five feet deep, were both dog and fox, alive and lively. The former was on guard, and the latter was intrenched in a little cave dug out in the side of the well, and whenever the fox ventured out the dog made a dash for it. It was evident that both were stunned when they struck the bottom, and that the fox, recovering first, scratched himself a shelter in the clay wall of the well before his antagonist came to her senses.

A rope lasso was made, and, after some angling, the hound was noosed and drawn out, the fox leaping up and biting and yelping in a frenzy of rage as his enemy was hoisted up. When last heard of, the fox was still in the well, but Dr. McNeill ordered that, when captured, it should have its freedom.—Charlotte (N. C.) Observer.

Points and Flashes.

A dog show will be a part of the live stock exhibit at the World's Fair, St. Louis, next year, according to the present intentions of the management.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

JULY.

- 6-8. New York, special races for 90-footers, Newport.
- 9-11. Beverly-Seawanhaka, Beverly cup, Monument Beach.
- 10-11. Mobile, Southern Gulf Coast Y. A., Mobile, Ala.
- 11. Chicago, special, Lake Michigan.
- 11. Moriches, club.
- 11. Seawanhaka Corinthian, club, Oyster Bay.
- 11. Royal Canadian, club, Toronto.
- 11. Bensonhurst, Y. R. A. of Gravesend Bay.
- 11. Norwalk, Y. R. A. of L. I. Sound, special.
- 11. Corinthian, second championship, Marblehead.
- 11. Eastern, run to Gloucester.
- 11. Eastern, annual, Marblehead.
- 11. Penataquit Corinthian, open, Bay Shore.
- 14. Hempstead Bay, club.
- 15. Eastern, cruise, Marblehead to Vineyard Haven.
- 16. Eastern, cruise, Vineyard Haven to Newport.
- 16. New York, fifty-eighth annual cruise, rendezvous Glen Cove.
- 17. Eastern, cruise, Newport to New London.
- 17-18. Pascagoula, Southern Gulf Coast Y. A., Pascagoula, Miss.
- 18. Beverly, second Corinthian, Monument Beach.
- 18. Keystone, club, Woodmere, L. I.
- 18. Atlantic, club, Sea Gate.
- 18. South Boston, club, City Point.
- 18. Penataquit Corinthian, special, Bay Shore.
- 18. Indian Harbor, motor boat race, Am. P. B. A., Greenwich.
- 18. Seawanhaka Corinthian, club, Oyster Bay.
- 18. Corinthian, third championship, Marblehead.
- 18. Savin Hill, club, Dorchester Bay.
- 18. Canarsie, club.
- 18. Riverside, Y. R. A. of L. I. S., annual.
- 18. Corinthian of Stamford, Y. R. A. of L. I. Sound.
- 18. Corinthian, 3d champ., Marblehead, Massachusetts Bay.
- 18. Winthrop, Y. R. A., open, Winthrop.
- 18. Chicago, races for Warrington and Lillienfeld cups.
- 18. Royal Canadian, L. Y. R. A., skiff races, Toronto.
- 21. Inter-Lake Y. A., open, Put-In-Bay.
- 22. Inter-Lake Y. A., open, yacht and power races, Put-In-Bay.
- 23. Inter-Lake Y. A., squadron sail and auxiliary race, Put-In-Bay.
- 24. Inter-Lake Y. A., open, Put-In-Bay.
- 24-25. Biloxi, Southern Gulf Coast Y. A., Biloxi, Miss.
- 25. Indian Harbor, club, Greenwich.
- 25. Beverly, cruise, rendezvous Monument Beach.
- 25. Boston, club, Hull.
- 25. Seawanhaka Corinthian, club, Oyster Bay.
- 25. Royal Canadian, L. Y. R. A., skiff races, Toronto.
- 25. Hartford, Y. R. A. of L. I. Sound, special.
- 25. Marine and Field, Y. R. A. of Gravesend Bay.
- 25. Hempstead Harbor, Y. R. A. of L. I. Sound, annual.
- 25. Bridgeport Y. R. A. of L. I. Sound, annual.
- 25. Chicago, club, Lake Michigan.
- 25. Penataquit Corinthian, cruise, rendezvous Bay Shore.
- 27. Atlantic, club, Sea Gate.
- 27-29. New York, Newport series, all classes, Newport.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

- First prize, \$75.00.
- Second prize, \$50.00.
- Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

THE trials between the two Shamrocks have been going on pretty regularly for the past week and the boats have been taken outside as often as the weather permitted. On June 30 the third Shamrock met with her second accident, the first mishap occurring on the other side, when she was dismasted off Weymouth. Fortunately the second misfortune was not of such a serious nature as the first, but nevertheless several days were lost while repairs were being made. The boats had been sent away for a trial spin, starting between Sandy Hook Lightship and Sir Thomas Lipton's steam yacht Erin, but soon after crossing the after traveler for the main sheet carried away on Shamrock III. and she was brought up into the wind quickly and her sails lowered and stowed. She was taken in tow by Erin, and all the boats returned to Sandy Hook Bay. There was a good breeze from the south of about ten knots strength when the accident happened. The day following Shamrock III. was towed to Erie Basin, where repairs were made. The accident was caused by the slatting of the big mainsail as she rolled in the swell. The sudden jerk caused the traveler to give way.

The first real race between the two boats in American waters took place on July 3. The race resulted in an easy victory for Shamrock III. The boats covered a 30

mile windward and leeward course. The compass course was E. S. E. and the wind was W. N. W. of about six knots' strength. On the run out to the leeward mark Shamrock III. gained 3m. 10s., and she won the race by 5m. 20s. On the beat back to the finish line the wind freshened materially and the boats were heeled well down and moved along at a smart clip. When nearing the end of the race the sprit of Shamrock I.'s club topsail broke, and she was brought up into the wind and the sail was taken down on deck. She then followed Shamrock III. on to the finish line. A favorable puff allowed the old boat to lay her course for the finish line and she more than made up the time she lost in stopping to get her topsail down. The summary:

	Start.	Outer Mark.	Finish.	Elapsed.
Shamrock III.	11 05 44	1 18 45	3 32 00	4 26 16
Shamrock I.	11 04 24	1 21 55	3 36 09	4 31 36

On the Fourth of July the two Shamrocks had another test. It proved to be little more than a drifting match, and the wind at no time during the contest was more than three or four miles an hour. The start was made off Sandy Hook Lightship, and the old boat was allowed to start over two minutes ahead of Shamrock III. The wind was S. S. W. and the tug Cruiser logged off fifteen miles in that direction and anchored there, making the weather mark. Shamrock III. started to leeward of Shamrock I., but soon worked into the weather berth. The breeze was so light that the mark boat Cruiser shortened the course from fifteen to eleven miles. The boats made very slow time to the mark, but Shamrock III. continued to get away from the old boat. After the boats rounded the weather mark the race was called off. The times were:

	Start.	Finish.	Elapsed.
Shamrock III.	12 20 40	4 33 40	4 11 00
Shamrock I.	12 20 20	5 02 30	4 42 10

Shamrock III. wins by 31m. 10s.

Columbia Y. C., of Chicago.

CHICAGO, July 6.—The annual open Independence Day regatta of the Columbia Y. C. was sailed to-day in a good yachting breeze. The official score was:

Class 1A.			
	Elapsed.	Allowance.	Corrected.
Vanenna	1 26 15	Scratch.	1 26 15
Vencedor	1 34 45	0 00 21	1 34 24

Vencedor protests, claiming Vanenna fouled at Carter Harrison Crib. Vencedor broke down afterward when in lead by over one minute.

Class 3A.			
Columbia	1 50 42	0 14 50	1 35 52
Widsith	1 53 48	0 11 32	1 42 16
Iris	2 32 30	0 14 13	2 18 17

Thor-Bjorn broke down just before finish line was reached and did not finish.

Class 4A.			
Vision	2 24 16	0 18 34	2 05 42
Eleanor	2 33 33	0 17 26	2 16 12

Saint, Snapshot and others did not finish. Saint capsized.

2ft. Cabin Class.			
Sprite	1 40 38		
La Rita	1 44 00		
Hoosier	1 44 20		
Outlaw	1 54 21		
Privateer	Withdrew.		

Schooners and Yawls.			
Alice	1 36 30	0 02 36	1 33 54
Nomad	1 56 30	0 06 41	1 49 49
Glad Tidings	2 34 10	0 11 08	2 23 02

Class 2B.			
Beatrice	2 02 28	0 06 46	1 55 32
Wizard	2 08 15	0 10 19	1 57 51
Sadie	2 13 20	0 04 00	2 09 20
Zephyrus	2 20 41	0 11 05	2 09 36
Jeannette	2 35 17	0 03 54	2 29 23

Class 3B.			
Kathleen	2 03 47	0 14 27	1 49 20
America	2 22 00	0 11 44	2 10 16

Class 4B.			
Halcyon	2 24 02	0 16 21	2 17 41
Marie	Withdrew.		
Zamona	Withdrew.		

Alice wins Wacker & Birk cup.
Nomad wins international code of signals.
Vanenna wins Pabst cup.
Columbia wins aneroid barometer.
Sprite wins leg on 18ft. to 30ft. L. W. L. cup and 100 points on 1903 championship series.
La Rita wins second prize, a club cap, and 80 points on championship series. Hoosier gets 60 points and Outlaw 40 points on first race.
Beatrice wins John B. Wiggins cup. Wizard wins second prize, Mooney stein set.
Kathleen wins marine glasses, first prize.
Halcyon wins aneroid barometer, first prize.

Afternoon Race—Start 3:30 P. M.

La Rita	5 47 10
Hoosier	5 53 08
Sprite	6 05 43

Light winds, S. W., and heavy fog.

Cohasset Y. C.

COHASSET, MASS.,
Saturday, July 4.

The annual race of the Cohasset Y. C. was sailed Saturday, July 4, in a fresh southeast breeze. The cat Edith won the handicap cup offered by Mr. Alanson Bigelow, Jr., beating the record over the club course. Delta won in the 21ft. knockabouts, and Result in the 18ft. knockabouts. The summary:

21ft. Knockabouts.		Elapsed.
Delta, R. B. Williams.		1 34 15
Eleanor, Moore Brothers.		1 35 20
Remora, Courtney Crocker.		1 35 55
Harelda, Alanson Bigelow.		1 36 30

18ft. Knockabouts.		Elapsed.
Result, A. H. Knowles.		1 49 40
Collie		1 50 12
Kanaka, Hugh D. Montgomery.		Withdrew.

Handicap Class.		Elapsed.
Edith, A. Abbot Hastings.		0 53 30
Willie, Harold B. Cousins.		0 55 00
Undine, Gilbert S. Tower.		0 58 20
No Name, Sheldon E. Ripley.		0 58 45
Castrel		1 02 33

New York Y. C. 90-Footers.

NEWPORT, R. I.,

First Race, Monday, June 29.

THE first race for the 90-footers off this port, which was the first of a series of six arranged by the regatta committee of the New York Y. C., was sailed to-day in a fresh easterly breeze and a choppy sea. Before the yachts left Newport harbor it was announced at the club station that the first prize for the series was offered by former Commodore Lewis Cass Ledyard, and that Rear Commodore Cornelius Vanderbilt would give the second prize. It was expected that this series would be of more than ordinary interest, and a large fleet of steam yachts and several of the larger sailing yachts started out of the harbor with the racing trio. The regatta committee, Messrs. S. Nicholson Kane, Newbury D. Lawton, and Edward H. Wales, accepted the invitation of Col. R. M. Thompson to sail on the steamer Riviera, and that yacht was the committee boat during the week.

When the Riviera got outside it was found that a windward and leeward course could not be laid from the Brenton's Reef Lightship, and so the signal E was set, meaning that the starting line would be shifted. The Riviera steamed about five miles S. W. of the Lightship and made the line about three miles E. of Point Judith. The course was E. and the distance 15 miles and return. The yachts had medium sized club topsails aloft, and when the preparatory signal was made at noon they began to maneuver for the start. The wind then was blowing about 18 miles an hour, and in sailing about they heeled much more than they have in any former races this year. Reliance and Constitution at times when the wind was abeam showed four strakes of bronze of their underbodies. When the starting signal was made at 12:15, Constitution was heading for the line from the S. She had been a little too soon and had to range along the line to the N. Reliance was on her weather quarter, and Columbia was astern, but to windward of both. They were on the starboard tack and Constitution crossed at 12:15:20, the Reliance at 12:15:24, and Columbia at 12:15:26. As soon as she was over the Constitution made a sharp luff and then bore away under the lee bow of Reliance, giving that yacht a back draught, so that Capt. Barr put the Reliance on the port tack; Columbia was still holding on to the starboard tack, and as the two yachts came together Mr. Morgan was forced to bear away sharply in order to avoid a foul. Reliance at once took the starboard tack and Columbia tacked to get her wind clear. She held the port tack for about three minutes and then she took the starboard tack, and all three were standing in toward the north shore. The tide was running to the west, and they were taking the seas on the weather bow. Constitution was carrying a mainsail she used in her races in 1901. It was a good looking piece of canvas, but the draught was not in the right place. Her gaff slackened off and she could not point with the other two. The yachts held this starboard tack until 12:35, and then Constitution took the port tack and Reliance followed her at once. By this time Reliance had taken a commanding lead, and she crossed the bow of Columbia with plenty to spare, but Constitution had fallen so far to leeward that she went astern of the older boat. Columbia held on until she was well to windward of the wake of Reliance, and at 12:38 she took the port tack, and all three were then heading S. E. Constitution took the starboard tack at 12:41:30, and headed in toward the shore again. Reliance followed at 12:46 and Columbia again to windward of all at 12:47. Each yacht held the inshore tack for exactly ten minutes, and then all came off shore again. They held the port tack for about half an hour, and in that time Reliance worked out to windward of Columbia and across that yacht's bow. Columbia took the starboard tack at 1:25, Reliance tacked a minute later, and Constitution, which was far astern, tacked at 1:26:45. They were then drawing in toward the mouth of the Sakonnet River and getting a fresher breeze, so that they heeled much more than at any time so far during the race. Columbia and Reliance held well in toward West Island Light and at 1:43:15 Reliance took the port tack and almost a minute later Columbia followed. Constitution did not go in so far and tacked at 1:44:31. Columbia and Reliance had to bear off a point in order to clear Sakonnet Point, and then were able to lay their course for the turning mark. Columbia had overstood a little more than Reliance, and Constitution, which was considerably to leeward of the other two, was able to fetch easily.

Passing Sakonnet Point the Reliance led Columbia by about a minute and a half and from there to the turning mark she rapidly increased her lead. They wore and gybed at the mark. Reliance heeled considerably and shot several lengths before Capt. Barr was able to ease off for the run home. Columbia turned like a catboat, swinging round as though she was on a pivot, and Constitution was even harder to handle than Reliance, and she made a much wider turn. The times at this mark and the elapsed times over the fifteen mile turn to windward are shown in the following:

	Start.	Turn.	Elapsed.
Reliance	12 15 24	2 08 35	1 53 11
Columbia	12 15 26	2 10 31	1 55 05
Constitution	12 15 20	2 12 02	1 56 42

On this leg Reliance had beaten Columbia 1m. 54s., and Constitution 3m. 31s. Columbia had beaten Constitution 1m. 37s.

Spinnaker poles were lowered to starboard. Reliance broke her spinnaker out at 2:10:40, Columbia at 2:13:41, and Constitution at 2:14:45. Then the balloon jib topsails were sent up and broken out. On Reliance this big sail was flown at 2:14:20, and the men on Columbia broke that yacht's balloon out at the same time. The balloon on Constitution was broken out at 2:19:20. This shows that the crew of Columbia handled the light sails much smarter than on either of the other yachts. The run down the wind was a fast one, in spite of the fact that all three yachts rolled considerably in the sea. Constitution closed up somewhat on Columbia, but could not pass that yacht. Reliance, as was expected, ran away from both of the others, and she crossed the finishing line at 3:25:17. Columbia crossed at 3:29:28, and Constitution at 3:30:11. Several watches on other boats made Constitution's time a minute later than the committee. The

elapsed times over the last leg of the course were:

	Turn.	Finish.	Elapsed.
Reliance	2 08 35	3 25 17	1 16 42
Columbia	2 10 31	3 29 28	1 18 57
Constitution	2 12 02	3 30 11	1 18 09

On the fifteen-mile run the Reliance had beaten Constitution 1m. 27s. and Columbia 2m. 15s. Constitution had beaten Columbia 48s. Reliance had averaged 11.7 miles an hour on the run home. The summary:

	Start.	Finish.	Elapsed.
Reliance	12 15 24	3 25 17	3 09 53
Columbia	12 15 26	3 29 28	3 14 02
Constitution	12 15 20	3 30 11	3 14 51

Reliance had beaten the Columbia 4m. 9s. elapsed time and Constitution 4m. 58s. Columbia wins second prize. She beat Constitution 49s. elapsed time.

Second Race, Tuesday, June 30.

The three yachts were out on time on Tuesday. Constitution had bent on another mainsail and all three had intermediate club topsails aloft. The wind was from the S. W., and was blowing about 12 miles an hour. It was almost high water at the Lightship when the starting gun sounded, and the tide was soon running to the E. There was a short choppy sea in which Constitution seemed to suffer most. The regatta committee on Riviera signalled the course, fifteen miles to windward and return, and then the compass course, S. W. The tugboat Unique logged the course. Fifteen miles S. W. from the Lightship would end on Block Island, so that the course was really a mile short. The preparatory signal sounded at 11:30 o'clock, and the starting gun fifteen minutes later. There was not much fighting for position at the start. The three yachts were to the W. of the Lightship when the gun sounded. Reliance crossed at 11:45:06 on the starboard tack. Columbia was on her weather quarter and crossed at 11:45:09, and Constitution ranged along the line to the committee boat end and crossed at 11:46:01, and then she took the port tack as she went over and Reliance and Columbia tacked at the same time. All were then heading in toward the Narragansett shore to get smooth water and the freshening puffs that always draw off that beach. Constitution at once dropped down to leeward, and she was the first to take the starboard tack, her time being 12:02:25. Columbia tacked five minutes later and Reliance ten seconds after Columbia. Columbia was very close to Reliance and Reliance had been forced to tack when she did. Only a short hitch of two minutes was made and then Columbia and Constitution stood in toward the shore again and Reliance followed thirty seconds after Columbia. She made a sharp luff while the crew got sheets down flat, and then Reliance and Columbia had a battle that was worth going miles to see. At 12:05:25 Columbia and Constitution took the starboard tack and stood off shore. Reliance was on the port tack and Columbia drew up so close to the new boat that she was forced to give way and Columbia, getting a back wind from Reliance, split tacks with her again and stood in shore. Reliance followed the old boat in at 12:08:14, and a few seconds later Columbia took the starboard tack, standing off, and at 12:09:30 forced Reliance about again, and as Reliance took the starboard tack Columbia took the port tack, standing in shore again. Again Reliance went after her, and as the new boat tacked in shore the old boat stood out, and at 12:12 Columbia forced Reliance about for the third time, and both split tacks again, Reliance standing off shore and Columbia in shore. Constitution was not able to look where the other two did, and was being left astern. In less than half a minute after Reliance was forced, Columbia was after her again, and at 12:13:15 Reliance was forced to give way for the fourth time. They came together at 12:14:30, and this time Reliance managed to pinch across Columbia's bow and had her wind clear. It had taken the new yacht about half an hour to shake off the older boat. The yachts continued to work along the shore in short tacks, and Reliance passed Point Judith at 12:30. She made a port tack when clear of the point, and then took the starboard tack and was on top of the Whistling Buoy at 12:37. The tide was then running to the E., and the yachts had it on their bow. There was more wind outside than there had been under the shore, and Reliance changed her small jib topsail for a still smaller one. When she had shaken off Columbia, the new yacht gave a remarkable exhibition of sailing, and rapidly left Columbia astern. Constitution was still going to leeward, and when clear of the Point Capt. Rhodes gave her a full to let her foot, but she would not foot any faster than Columbia. At 1:26 Reliance took the port tack to fetch the mark. Capt. Barr had to pinch to succeed in his object, and Columbia and Constitution, which had tacked with Reliance, each had to make a short hitch. Reliance bore off at the mark at 1:34. She eased her boom off to port for the run home. Columbia turned the mark at 1:38:20, and Constitution at 1:39:54. The elapsed times over the fifteen-mile turn to windward were:

	Start.	Turn.	Elapsed.
Reliance	11 45 06	1 34 00	1 48 54
Columbia	11 45 09	1 38 20	1 53 11
Constitution	11 46 01	1 39 54	1 53 53

Reliance had beaten Columbia 4m. 17s. and Constitution 4m. 59s. Columbia had beaten Constitution 42s.

Spinnaker poles were lowered to starboard. Reliance had her spinnaker drawing 2m. 50s. after rounding, Columbia in 2m. 25s., and Constitution in 1m. 38s. In setting balloon jib topsails, Columbia's men were again the smartest. It took them 5m. 17s. after rounding to get that sail up in stops and broken out. The crew of Reliance took 6m. 25s., and the crew of Constitution 5m. 26s. The yachts rolled much more than they did on the first day, and booms had to be lifted. Reliance used a smaller spinnaker than the other two, and it was kept full better than the larger sails. Constitution's spinnaker was frequently hanging limp without any wind in it at all. Reliance drew away from the other two very easily, and Constitution closed up on Columbia, so that on passing the Whistling Buoy off Point Judith the two were almost on even terms, but after that Columbia stuck to Constitution, and at the finishing line Constitution was only seven seconds ahead of the older boat. Reliance crossed the line at 3:00:44, Constitution at 3:08:41, and Columbia at 3:08:48. The times for the run home are as follows:

	Turn.	Finish.	Elapsed.
Reliance	1 34 00	3 00 44	1 38 44
Constitution	1 39 54	3 08 41	1 28 47
Columbia	1 38 20	3 08 48	1 30 28

Reliance had beaten Constitution 2m. 3c. and the Columbia 3m. 44s. Constitution had beaten the Columbia 1m. 41s. The summary:

	Start.	Finish.	Elapsed.
Reliance	11 45 06	3 00 44	3 15 38
Constitution	11 46 01	3 08 41	3 22 40
Columbia	11 45 09	3 08 48	3 23 39

Reliance beat Constitution 7m. 2s. elapsed time and Columbia 8m. 1s. Constitution beat Columbia 59s. elapsed time, but she won second prize on corrected time.

It was thought that Reliance had made a new record for fifteen miles to windward, but the fact that the course was short knocks this out.

Third Race, Wednesday, July 1.

Sir Thomas Lipton, Designer William Fife and Captains Wringe and Bevis arrived early in the morning on the steam yacht Erin to watch the yacht race. Constitution ran up to Bristol early in the morning to get another mainsail, the third used in the week, and she was not on hand when the yachts left the harbor, but as she expected to get back in time to race, the start was postponed. Reliance and Columbia sailed out of the harbor with the same club topsails aloft that had been used in the former races, and when near the Brenton's Reef Lightship, the committee signalled that the starting line would be shifted and steamed off to the E. The line was made about 4 miles E. of the Lightship, and about 3 miles S. of Ochre Point. There was a long wait and about 12:30 o'clock Constitution was sighted. Then the course was signalled S. W. by W. 15 miles. It was 15 miles to windward and return. The preparatory signal was made at 1 o'clock. The wind was then blowing about 12 miles an hour, but it freshened considerably later on. The maneuvering at the start was tame. Constitution crossed the line first on the starboard tack at 1:15:15. Reliance crossed on the port tack at 1:16:12, and Columbia waited until the end of the two minutes and was timed at 1:17. She was on the starboard tack. Constitution took the port tack as Reliance crossed, but both yachts went back on the starboard tack as Columbia went over. Five minutes later all took the port tack and held in toward the Narragansett shore; Constitution was leading and was on the weather bow of Reliance, and Columbia was astern, but was to windward of the wakes of the other two yachts. There was quite a jump on the sea and a thick haze hung over the water through which the sun was trying to shine. At 2:49:25 Constitution took a hitch to the E., and after crossing Columbia took the port tack again. Reliance took the starboard tack at 1:54:20. She crossed Constitution's bow at 1:56, and some seconds later took the port tack again. The yachts worked along the shore as on the former day, and then, after passing Point Judith, they still made short tacks out to the weather mark. When clear of the shore, Columbia took in her baby jib topsail and sailed for about five miles without any sail above her jib. She stuck to Constitution and closed up on that yacht considerably, but could not quite get by. The turning mark was under the Block Island shore, and to get there Reliance made eleven tacks, Columbia fourteen and Constitution twenty. Reliance turned the mark at 3:09:35, Constitution at 3:12:43, and Columbia at 3:13:07. Columbia was right on top of Constitution at the mark, and made a much sharper turn, but in doing so she very nearly ran Constitution down, and in keeping off her boom struck the cone on top of the mark and smashed it. The times of the first leg of the course are:

	Start.	Turn.	Elapsed.
Reliance	1 16 12	3 09 35	1 53 28
Columbia	1 17 00	3 13 07	1 56 07
Constitution	1 15 15	3 12 43	1 57 28

On this leg Reliance had beaten the Columbia 2m. 14s. and Constitution 4m. 5s. Columbia had beaten Constitution 1m. 21s.

Sheets were eased off to starboard for the run home, and the spinnakers were set to port. Columbia had sent up a balloon jib topsail before reaching the mark, and this was broken out as soon as she turned. Reliance's spinnaker was out and drawing 2m. 25s. after turning. On the Constitution it took 2m. 47s. to get the big sail broken out, and on the Columbia it took 4m. 23s. The balloon jib topsail was broken out on Reliance 8m. 10s. after turning the mark, and on Constitution it was 9m. 17s. after turning. The run home was a very fast one. Reliance drew away from Constitution as usual, and Columbia was left by Constitution. Reliance crossed the finishing line at 4:20:39, Constitution at 4:24:12, and Columbia at 4:27:16. The elapsed times over the last leg of the course and the gains are shown as follows:

	Turn.	Finish.	Elapsed.
Reliance	3 09 35	4 20 39	1 11 04
Constitution	3 12 43	4 24 12	1 12 29
Columbia	3 13 07	4 27 16	1 14 09

Reliance had beaten Constitution 1m. 25s. and Columbia 3m. 5s. Constitution had beaten the Columbia 1m. 40s. Off the wind Reliance had averaged 12.67 miles an hour or a mile in 4m. 45s. The summary:

	Start.	Finish.	Elapsed.
Reliance	1 16 12	4 20 39	3 04 27
Constitution	1 15 15	4 25 12	3 09 57
Columbia	1 17 00	4 27 16	3 10 16

Reliance had beaten Constitution 5m. 30s. and Columbia 5m. 49s. Constitution beat Columbia 19s. elapsed time and Columbia wins the second prize on corrected time.

After the race had ended Erin started back for Sandy Hook. Mr. Iselin, when he got back to the harbor, said that he did not care for any more races at present, and that he was satisfied with the Reliance, but he was induced to make one more start the next day.

Fourth Race, Thursday, July 2.

There was a strong wind and a big sea when the yachts left the harbor. They had set small club topsails. The strating line was at the same place as on the previous day, and when the yachts got there the wind had increased in strength so that it was blowing at least 25 miles an hour. The club topsails were sent down just before the preparatory signal was made. The course was triangular. The wind was S. W. by W., and the first leg of the course was 10 miles, S. W. by W.; the second leg

BAGHEERA.

MARION.

DESCRIPTION OF BOATS THAT PARTICIPATED IN THE RACES FOR THE MANHASSET BAY CHALLENGE CUP.

Boat.	Owner.	Club Represented.	Designer.	Builder.	Year.	O. A.	L.W.L.	Breadth.	Draft.	R. L'gth.
Alert	J. W. Alker	Manhasset Bay Y. C.	N. G. Herreshoff	Herreshoff Mfg. Co.	1902	42.2	28.3	9.5	6.5	29.99
Marion	C. P. and T. W. Brigham	Shelter Island Y. C.	T. W. Brigham	Greenport B. and C. Co.	1901	37.	24.8	9.	6.4	28.28
Oiseau	H. L. Maxwell	Indian Harbor Y. C.	N. G. Herreshoff	Herreshoff Mfg. Co.	1899	43.	25.	10.	6.4	29.85
Bobtail	E. F. Luckenback	Bensonhurst Y. C.	N. G. Herreshoff	Herreshoff Mfg. Co.	1902	40.5	26.5	9.4	4.3	29.89
Mimosa	T. L. Park	American Y. C.	B. B. Crowninshield	Swasey, Raymond & Page	1902	39.8	25.8	9.7	6.5	29.80
Enpronzi	R. A. Rainey	Larchmont Y. C.	B. B. Crowninshield	B. F. Wood	1900	38.	25.	10.3	6.6	31.70
Bagheera	Hendon Chubb	Atlantic Y. C.	Clinton H. Crane	B. F. Wood	1902	45.8	29.5	9.6	7.	29.95
Flosshilde	W. D. Hennen	New York A. C.	B. B. Crowninshield	W. B. Smith	1901	43.	25.5	10.4	6.9	31.60

10 miles S. E. by E. ½ E., and the third leg N. ½ W. The preparatory signal was made at 12:15, and the yachts sailed around, keeping out of each other's way, until the starting gun went at 12:30 o'clock. Columbia crossed the line on the starboard tack at 12:30:45, Reliance crossed with the handicap gun at 12:32, and Constitution was twenty-seven seconds later. Columbia and Reliance took the port tack at once, and Constitution held on for a minute after crossing and then she took the port tack. Reliance soon began to overhaul Columbia, but Constitution was doing better than either of the other two. She was footing fast and pointing high, and at 12:40 Reliance took the starboard tack to go after Constitution. Just as Reliance tacked the jaws of the gaff on Constitution broke and then the gaff snapped about twenty feet from the jaws. Reliance and Columbia made a good fight for 40 minutes, and then Reliance crossed her bow and gradually drew away from the old champion. Reliance turned the weather mark at 1:52:20. It had taken her 1 hour 20m. 40s. to make 10 miles to windward. Columbia was then about two minutes astern of her. The gaff topsail on Columbia had been set and men were on the bowsprit sending up a No. 1 jib topsail. The yacht suddenly stuck her bowsprit under a big sea and Carl B. Olsen, the second man on the bowsprit, was washed off and lost. The first man held on and the third and fourth men were washed inboard. A dinghy was lowered at once and a search, which lasted half an hour, made for Olsen, in which several yachts joined, but nothing more was seen of him. He was probably hurt on the martingale and then sucked under the yacht. Capt. Miller said that he never knew the yacht to stick her nose under before.

Reliance set a No. 2 jib topsail for the second leg and she made the 10 miles in 51m. 30s. On the third leg she carried a balloon jib topsail. The wind was lighter and the sea smoother and she made the 10 miles in 47m. 10s. The summary:

	Start.	Finish.	Elapsed.
Reliance	12 32 00	3 31 20	2 59 30
Columbia	12 32 00	Did not finish.	
Constitution	12 30 45	Disabled.	

Reliance pounded hard in the seas, and when she got back to harbor it was found that she had dented two plates under the port bow. The lower strake, which is just above the waterline, was knocked flat, and in the plate above it there was a dent about six feet long, eighteen inches wide, and deep enough for a man to lay his arm in. Mr. Iselin made light of the trouble, and said it could soon be hammered out. He said that he was well satisfied with the yacht and would do no more racing until the cruise. Mr. Morgan said that he did not care to race any more, having lost a man, and so the other races were declared off. Reliance went to Bristol the next morning, and will have two new plates put on in place of the damaged ones.

The schooner Quisetta, owned by Mr. Samuel C. Davis, of St. Louis, has been entirely overhauled and refitted by the Greenport Basin and Construction Company, Greenport, L. I. She will be in charge of Captain George Parker, a well known British racing skipper, and will be run with an English crew.

The newly organized Port Jefferson Y. C., of Port Jefferson, L. I., held a meeting on June 30 and elected the following officers: Com., John E. Overton; Vice-Com., Dr. H. S. Pettit; Sec'y, Charles V. Platt; Treas., George F. Bayles; Regatta Committee—Charles V. Platt, Robert Wilson, Garrie Smith, Fred Huff, Ralph H. Hawkins,

Manhasset Bay Challenge Cup Races.

ONE of the most important of this season's events among the smaller craft was the races for the Manhasset Bay Challenge Cup. The cup was offered by the Manhasset Bay Y. C., and the races were held under the auspices of that club.

The races were an unqualified success in every way, and the racing was of the cleanest sort, for in the three contests in which the boats met, there were no protests, fouls or disqualifications, and the best possible feeling existed between the different crews. The races were admirably managed, and the judges were among the best known in the country. The cup was offered by the members at the suggestion of Mr. Edward M. MacLellan, the club's secretary, and it was through his untiring efforts that the matches were so satisfactory to all concerned.

Com. A. H. Alker loaned his steam yacht Florence to the race committee, and she was used as the judges' boat. The Regatta Committee was made up of Mr. Walter C. Kerr, Seawanbaka-Corinthian Y. C.; Stuyvesant Wainwright, American Y. C., and Louis M. Clark, Eastern Y. C.

The Manhasset Bay Y. C. chartered the steamer Huntington, and she followed the boats over the course each day, so that the members of the different clubs could see the races.

First Race, Monday, June 29.

In the morning the prospects for a race were not good. It was raining very hard, and a strong N. E. wind that had been blowing all night had kicked up a nasty sea outside. As the day wore on the weather improved, and shortly after 1 o'clock the Regatta Committee decided to start the race.

The committee boat anchored to the N. E. of Execution Light, and set course signals. Most of the boats towed out to the starting line in order to keep their sails dry as long as they could. All of the boats entered with the exception of Enpronzi, and that boat was unable to sail as she was short handed.

The course was to windward from the starting line off Execution Light, to and around the Larchmont racing buoy, off Parsonage Point, and back to the starting line. The length of each leg was four and one-eighth nautical miles, and as the course was sailed over twice, the total distance covered was sixteen and one-half nautical miles.

The preparatory was given at 3 o'clock and the boats were sent away ten minutes later. At this time it had stopped raining, and there was a N. E. breeze of over twelve knots' strength blowing, which kicked up a lump of a sea. The tide was running flood. At the time of starting Alert, Bagheera, Marion and Mimosa were reefed, while Oiseau, Bobtail and Flosshilde were swinging full sail.

Mimosa was just on the line when the starting signal was heard, crossing on the starboard tack on the leeward end of the line. The rest of the boats crossed in the following order, all on the port tack. Oiseau, Alert, Marion, Flosshilde, Bobtail and Bagheera. Bagheera was late in crossing, as she had stopped to reef just before the start, and in consequence was the last boat over. The start, as a whole, was a remarkably fine one.

All the boats with the exception of Mimosa, stood

in on the starboard tack toward the New York shore in order to get out of the head tide and also to get into smoother water. Mimosa took a port tack and made a long hitch in under the Long Island beach. Oiseau was leading the bunch in toward Mamaroneck Harbor, but Alert shook out her reef and came up on her rapidly.

When Mimosa took the starboard tack she crossed Marion's bow, which boat had followed her out in the Sound. When on her last hitch for the mark, Oiseau crossed Mimosa's bow and that boat took the starboard tack under Alert's lee. At the weather mark off Parsonage Point the boats were timed as follows:

Oiseau	4 10 08	Flosshilde	4 16 00
Alert	4 11 24	Bobtail	4 17 47
Mimosa	4 12 15	Bagheera	4 20 05
Marion	4 14 10		

Flosshilde lost quite a little on rounding the mark. Oiseau set spinnaker to port and the others followed suit as they rounded. The wind had been gradually dropping since the start, and was getting much lighter. On the run home the boats were strung out in a long line, and all were about the same distance apart. Oiseau took her spinnaker in a long time before reaching the mark, and all the others did the same thing. The times at the end of the first round were:

Oiseau	4 46 40	Flosshilde	4 52 42
Alert	4 47 30	Bobtail	4 55 05
Mimosa	4 49 40	Bagheera	4 57 50
Marion	4 52 03		

After gybing around the mark, all the boats but Bobtail held out into the Sound on the port tack, in order to get a lee bowing tide, for it had turned and was running ebb. Oiseau and Alert held well over to the Long Island shore, and made a good gain on the others, although Oiseau dropped Alert a little. The breeze was losing weight all the time, and it did not have one-third the strength it had at the start. Flosshilde caught Marion and got around the weather mark a couple of seconds ahead of her. At the Parsonage Point mark the boats rounded as follows:

Oiseau	5 42 35	Marion	5 52 32
Alert	5 44 20	Bobtail	5 55 15
Mimosa	5 50 40	Bagheera	5 59 30
Flosshilde	5 52 30		

Spinnakers were set and broken out, but the boats did not move very smartly in the light breeze. Bobtail found the light air to her liking, and worked by Marion. Ballooners were set on most of the boats, as the wind had worked to the eastward a little. When nearly off Glen Cove, Bagheera, which was a long way behind, doused her spinnaker, trimmed sheets and headed in for Glen Cove, withdrawing from the race. The breeze finally worked well around to the north and freshened perceptibly. The boats behind felt the new wind first and closed up on the leaders fast. All gybed over and set spinnakers to starboard. Bobtail passed Flosshilde and took fourth place, and Mimosa came up on Oiseau. Alert led over the finish line by 24s., followed by Oiseau, Mimosa, Bobtail, Flosshilde and Marion.

	Finish.	Elapsed.	Corrected.
Alert	6 49 02	3 39 02	3 36 15
Oiseau	6 49 26	3 39 26	3 36 23
Marion	6 52 23	3 42 23	3 36 24
Mimosa	6 51 07	3 41 07	3 38 20
Bobtail	6 51 44	3 41 44	3 38 57
Flosshilde	6 52 20	3 42 20	3 39 33
Bagheera	Did not finish.		
Enpronzi	Did not start.		

The summary:

Alert beats Oiseau, 8s. and Marion 9s. corrected time.

Points won were as follows: Alert 7, Oiseau 6, Marion 5, Mimosa 4, Bobtail 3, Flosshilde 2 and Bagheera 0.

Second Race, Tuesday, June 30.

The weather conditions for the second race of the series were quite in contrast with those which prevailed during the previous day's race. When the committee boat Florence anchored off Execution Rock buoy shortly after 1 o'clock, there was a nice S. W. breeze blowing of about ten knots, and there was no sea on. The course was from the starting line E. S. E. three and three eighths miles to and around Red Springs buoy, thence N. N. W. three and one-half miles to and around the spar buoy off Scotch Caps, thence S. W. $\frac{1}{4}$ S. two and three-quarter miles to the starting line. A distance of nine and five-eighths miles to be covered twice, making a total distance of nineteen and one-quarter miles.

The preparatory signal was given at 2 o'clock, and ten minutes later the boats were sent away. Mimosa was again the first over, followed by Marion, Flosshilde, Oiseau, Alert, Bagheera, Enpronzi and Bobtail in the order named. It was a reach to the first mark, and balloon jibs were broken out smartly on all the boats except Bobtail. Marion luffed well out on the others, and set balloon staysail. She was the only one of the eight boats with a double head rig. Oiseau swung astern of Marion and Alert. Alert, the best boat in the fleet on reaching, worked away from the bunch. Bobtail dropped Enpronzi and worked ahead of Bagheera, and Flosshilde pulled up on Alert. As the boats drew into the mouth of Hempstead Harbor, the breeze strengthened, and some of them were pretty well laid out under the fresh wind. The boats were timed as they gybed around the Red Spring's mark as follows:

Alert	2 36 20	Mimosa	2 37 32
Flosshilde	2 36 36	Bobtail	2 37 39
Marion	2 37 03	Bagheera	2 37 51
Oiseau	2 37 25	Enpronzi	2 38 00

After gybing, booms were used off to starboard, and as the wind was well aft, a spinnaker was soon set on Oiseau. Spinnakers now appeared on all the boats. Bobtail worked into third place, having passed Marion and Mimosa. Oiseau, Mimosa and Enpronzi overtook Marion and Bagheera. At the mark off Scotch Cap some nice work was seen on the part of Mr. Maxwell. Bobtail was forced to give way to Flosshilde at the mark, and Oiseau neatly slipped inside of both these boats. The times at this mark were:

Alert	3 12 16	Mimosa	3 15 00
Flosshilde	3 14 26	Bagheera	3 15 40
Oiseau	3 14 38	Marion	3 17 00
Bobtail	3 14 40	Enpronzi	3 18 20

The wind was now very light, but still blowing from the S. W. Alert went off on the starboard tack after rounding, standing well out into the Sound. She found a better breeze over toward the Long Island shore, and then took a port tack, holding on toward Execution. The other boats had been working port tacks in on the north shore. Flosshilde crossed Bobtail's bow and Oiseau went about on Flosshilde's weather bow, but she drew through Oiseau's lee. The breeze freshened a little, and the boats moved along at a smart clip. Bobtail drew through to leeward of Flosshilde and Oiseau, and got a good lead on the latter boat. Oiseau pointed very high, but did not seem to foot quite so fast. Mimosa made a long hitch across the Sound into the mouth of Hempstead Harbor. Bagheera's jib came down on the run, and went into the water, but repairs were speedily made, and the sail was soon hoisted again. Oiseau was able to cross Flosshilde's bow when they came together. The times at the end of the first round were:

Alert	3 49 20	Enpronzi	3 55 45
Oiseau	3 52 45	Marion	3 56 05
Mimosa	3 53 35	Bobtail	3 56 10
Flosshilde	3 54 00	Bagheera	3 56 15

Bobtail cut in ahead of Bagheera at the mark. Sheets were eased off for the reach to the next mark. The breeze had freshened again and had hauled more to the southward. Alert continued to get away from the others, and at the Red Spring buoy had a substantial lead. The times at that mark were:

Alert	4 16 37	Enpronzi	4 24 00
Oiseau	4 20 26	Marion	4 24 00
Mimosa	4 21 21	Bobtail	4 24 10
Flosshilde	4 22 30	Bagheera	4 25 19

The breeze had hauled enough to make it a run to Scotch Caps, and spinnakers were set to port on all the boats. Bobtail did better on this leg and passed Enpronzi. Alert was so far ahead that the race was beginning to lose interest. The race lay between the hindmost boats, and Mimosa picked up a little on Oiseau. The boats were timed at the Scotch Caps buoy as follows:

Alert	4 56 30	Marion	5 04 35
Oiseau	5 01 43	Bobtail	5 04 55
Mimosa	5 02 26	Bagheera	5 05 45
Flosshilde	5 04 00	Enpronzi	5 06 48

The breeze was very light at this mark, even lighter than it was on the first round. All the boats were heading in different directions, owing to the different slants of the wind. It was now a beat to the finish, and Oiseau, Mimosa, Flosshilde and Bobtail held in toward the north shore in order to lee bow the tide. The other four boats, Alert, Marion, Bagheera and Enpronzi did the wisest thing, and worked over toward the Long Island shore, where the new breeze was coming from. Alert had two boats to beat, Marion and Oiseau, and it was a question which one to stick to. Marion held much further over to the Long Island shore than Alert did, and greatly benefited thereby. The boats over toward the New York shore were almost becalmed. Alert was first over the finish line, with Marion a good second, with Bagheera third. Enpronzi, Oiseau, Bobtail, Mimosa and Flosshilde followed in the order named. The summary:

	Finish.	Elapsed.	Corrected.
Marion	5 44 41	3 34 41	3 27 30
Alert	5 43 40	3 33 40	3 30 13
Bagheera	5 46 55	3 36 55	3 33 28
Enpronzi	5 48 07	3 38 07	3 38 07

Oiseau	5 56 22	3 46 22	3 42 36
Bobtail	6 02 33	3 53 33	3 50 06
Mimosa	6 06 14	3 56 14	3 52 47
Flosshilde	6 04 34	3 54 34	3 54 22

Marion beat Alert 2m. 43s. and Bagheera 5m. 58s. corrected time.

The standing in points at the end of this race follows: Alert 14, Marion 13, Oiseau 10, Mimosa 6, Bobtail 6, Bagheera 6, Enpronzi 5 and Flosshilde 3.

Third Race, Wednesday, July 3.

All through the morning there was a nice S. W. breeze, and everything was propitious for a good race, so the Regatta Committee decided to start the boats earlier than on the two previous days.

The course signaled from the committee boat Florence was the same as the boats covered on Monday; from the starting line to and around the spar buoy off Parsonage Point, thence back to the starting line. The course to be sailed over twice, making a total distance of sixteen and one-half miles. As the wind was W. S. W. of about eight knots' strength, it was a run to the outer mark and a beat back to the starting line.

The preparatory was given at 1 o'clock, and at 1:10 the starting signal was heard. Mimosa had the best start for the third time. She was followed over the line by Oiseau, Marion, Alert, Flosshilde, Enpronzi, Bagheera and Bobtail in the order given. Bobtail luffed out into the weather berth, and all set spinners. Alert soon pulled into the lead, Marion was next with Mimosa in third place. Flosshilde, Bobtail, Bagheera and Enpronzi were strung out behind. Oiseau had run out of the wind, and her light sails hung limp. The wind was very fluky, and first one boat would have it and then another. Mimosa passed Alert and Bobtail made a big gain by holding inshore, and drew up into second place. The breeze finally came out of the S. W., and all the boats gybed over and reset their spinnakers to starboard. The new breeze reached the leading boats first, a rather unusual thing. Mimosa got into a luffing match with Bobtail, but the latter boat could not get by. The times at the leeward mark off Parsonage Point were:

Mimosa	1 56 49	Flosshilde	1 58 15
Bobtail	1 57 00	Marion	1 59 06
Alert	1 57 14	Enpronzi	2 00 02
Bagheera	1 58 09	Oiseau	2 01 17

After rounding the mark all the boats held starboard tacks over toward Long Island, in order to lee bow the flood tide and get better wind. Oiseau was the first boat to go about, and after making a hitch on the port tack again, tried the starboard tack. Alert pointed high and turned out to windward in fine shape. Bobtail also did well and passed Mimosa. Alert finally took port tack and the rest followed her. Oiseau was the only boat that did not overstand the mark. The times at the end of the first round follow:

Alert	2 54 04	Oiseau	2 57 26
Bobtail	2 54 45	Marion	2 57 37
Mimosa	2 55 32	Bagheera	2 57 46
Flosshilde	2 56 28	Enpronzi	3 00 22

Alert's spinnaker was set very smartly. Bobtail was close behind and pushed her hard for first place. Mimosa had a good lead on Flosshilde. Bobtail finally worked into the lead, and before reaching the mark took in her balloon and set her working jib. The boats were timed at the leeward mark as follows:

Bobtail	3 36 08	Oiseau	3 40 11
Alert	3 36 21	Bagheera	3 41 11
Mimosa	3 38 20	Marion	3 41 20
Flosshilde	3 39 30	Enpronzi	3 44 45

All the boats again took the starboard tack over toward Long Island, except Marion, which boat made a hitch on the port tack, but soon came about and followed the others. Shortly after rounding, Flosshilde met with an accident and withdrew. She broke the jaws of her gaff and was taken in tow by the steamer Huntington. This was the first and only accident that occurred during the series. The breeze had gained strength, and Alert found the breeze to her liking. She went into the lead, and from that time on she was never headed. Bobtail retained second place with Mimosa a good third. The boats finished in the following order: Alert, Bobtail, Mimosa, Oiseau, Marion, Bagheera and Enpronzi.

	Finish.	Elapsed.	Corrected.
Alert	4 35 16	3 25 16	3 22 19
Bobtail	4 36 26	3 26 26	3 23 29
Marion	4 40 31	3 30 31	3 24 22
Mimosa	4 37 27	3 27 27	3 24 30
Oiseau	4 38 56	3 28 56	3 25 43
Bagheera	4 41 29	3 31 29	3 28 32
Enpronzi	4 46 35	3 36 35	3 36 35
Flosshilde	Disabled.		

The number of points that each boat had to her credit at the end of the series follow: Alert 22, Marion 19, Oiseau 14, Bobtail 13, Mimosa 11, Bagheera 9, Enpronzi 7 and Flosshilde 3.

The races conclusively demonstrated that Alert was the best all around boat of the eight, although Oiseau was very nearly her equal. This boat had the worst of the luck in every race, which accounts for the indifferent showing she made. Bobtail will prove a very dangerous craft in light airs, and when her owner and his crew get better acquainted with her and make some changes in her trim, she will show up to much better advantage. The greatest surprise was the excellent performances made by Marion. She was not considered dangerous, but proved to be a dark horse. Had she been favored with a little more luck she would have carried the cup back to Shelter Island. Flosshilde did not do as well as was expected, and Bagheera and Enpronzi were in rather too fast company.

The American auxiliary Utowana, while proceeding through the North Sea, collided with an unknown steamer during a thick fog when twenty-five miles north of Dunquerque. The yacht is owned by Mr. Allison V. Armour. She was pretty badly damaged, and the hull was stove in forward above the waterline. The accident happened on June 28.

The Regatta Committee of the Indian Harbor Y. C. has awarded the race sailed on June 19 under the auspices of their club to Reliance. A protest was entered by the owner of Constitution, but it was not sustained.

The Canada's Cup Defender.

TORONTO, July 4.—Strathcona has been doing some splendid work of late, and Toronto yachtsmen are beginning to feel confident of a splendid defense of the cup. The yacht has not yet been seen at her best, but she is working out beautifully.

The series of trials with Mr. H. C. McLeod's swift cutter Gloria, proved that Strathcona, although shorter and smaller in every way, was practically the equal of this Mediterranean flyer in light winds. The trials came to an end with Gloria's departure for salt water. Mr. McLeod is no summer afternoon sailor, and the Gulf of St. Lawrence and ocean coast possess many attractions for him. He is a former resident of Halifax. Gloria will spend the summer in her owner's old cruising grounds, winding up at mooring in the Sound in time for Mr. McLeod to attend the America Cup races. She will return to Toronto before the close of navigation on the lakes and canals.

Mr. McLeod's deep interest in the defense of the Canada's Cup led him to postpone his departure for salt water for some time, and Strathcona profited considerably by his generosity. Gloria is, as has been stated before, probably the fastest yacht on fresh water, and the advantages of a comparison with such a flyer are enormous. That Strathcona has come out so well is a high tribute to the new rules, of which she is the first product.

The departure of Gloria did not, however, leave Strathcona without excellent material for trying-out purposes. The Royal Canadian Y. C. fleet has all along been a squadron of flyers, rather than a fleet of cruisers, with one or two racers. The best designers of the old land have contributed to its ranks. Both Fife and Watson are well represented. Such boats as Yama, Zelma and Vreda, of approximately Strathcona's size, represent the old country designers. Merrythought and Ozzie, designed and built by Capt. James Andrews, of Oatsville, are the best of the home product. All of these mentioned are flyers of more than local repute. Merrythought is a particularly interesting craft. Built for a fast cruiser in 1895, she was raced under the name Winnetta and practically abandoned as useless. A couple of years later Mr. Æmilius Jarvis purchased her and re-rigged her from the decks up. The result was marvelous. She began to clean up all the prizes in sight. Being a stiff craft, with nineteen tons of lead, Mr. Jarvis was able to carry on sail, and kept giving her wings, until now she is a cloud of canvas. She races as a cutter and cruises as a yawl, the transformation being completed in a day half a dozen times in the season. It is a great satisfaction to local yachtsmen to see this all-Canadian craft brought up to perfection by an amateur and defeat the products of Fife and Watson, sailed by professionals.

Merrythought is the best trying-out material Strathcona can find, and will give her plenty of racing during the next month.

Strathcona made an excellent showing in the race for that time-honored Lake Ontario trophy, the Queen's Cup, on Dominion Day, July 1. She was not entered in the race, but covered the course with the others in a manner that showed she would have been a sure winner. She was handled by a non-racing skipper with a scratch crew, in all sorts of weather, and slipped around the course in less time than the actual winner.

The race was twice around a fifteen-mile triangle in Lake Ontario, the apex being near Toronto Island, one buoy lying to the southeastward and the other south and west. It was blowing a splendid breeze from the southwest, and three craft, Vreda, Merrythought and Strathcona, went over the line with lee rails awash. Capt. Wm. Bruce, one of the best professional sailors on the lakes, was in Mr. Penchen's yacht Vreda, Com. Jarvis sailed Merrythought, and Mr. Norman Macrae, Strathcona's owner, handled her throughout the race. Although Mr. Macrae is not a racing skipper, he acquitted himself very creditably.

Merrythought and Vreda went over the line within a length of each other, and Strathcona, to give the actual contestants fair play, held back, starting 4m. 10s. after Merrythought. The first leg was a reach with sheets well in, and the racers fled along at steamboat speed. Strathcona was sailed almost close hauled for a long distance, and so covered much more ground at a slower pace. Nevertheless, Merrythought had not quite a 5m. lead at the turn of the easterly buoy.

It was a thrash to the westerly one. Merrythought overstood the buoy in the slight haze, and although she was footing much faster than Vreda, the latter turned the mark first. Strathcona lost time through the tack of her jibtopsail carrying away, but a nimble sailor went out on the luff of the jib, bent on a new tack, and then they bowled it down.

With spinnakers soaring heavenward, until the booms were on end, the yachts tore back to the starting buoy. The sea was rolling high, and Vreda, turning the mark, had to stay rather than gybe. Mr. Jarvis, with magnificent seamanship, gybed over and almost recovered what he had lost in the beat to windward. He was just 55s. astern starting the second round.

The wind came in wicked puffs, and all three shortened down to lower sails at the first buoy. Soon it lightened, and the excellent seamanship aboard Merrythought again told. She showed her kites in short order, and quickly passed Vreda, and increased her lead in the beat to the westerly buoy. Strathcona came along like a flying horse and also passed Vreda, turning the westerly buoy second. The shift in the breeze allowed a broad reach home, and the yachts tore along under club topsails, Merrythought finishing with a comfortable lead. She was only 3m. 30s. ahead of Strathcona, and the latter was leading Vreda by fully 2m. Strathcona, therefore, gained nearly 45s. on Merrythought, and 6m. on Vreda. How the trio compare in actual racing measurements is not known, but it is stated that Merrythought and Vreda would have to give Strathcona at least 5m. time allowance in the thirty miles.

Strathcona went up to Oakville on Friday to complete her cargo of ballast. She took in about a ton and a half of lead pigs, to be placed on her floors. This is necessary to bring her down to her full waterline

length, 40ft. She has been floating 5in. short. Her total inside and outside ballast now weighs 12 tons. Strathcona's English suit of canvas has been bent. Com. Jarvis will take charge of her at the end of the month.

CHARLES H. SNIDER.

archmont Y. C. Race Week.

LARCHMONT, LONG ISLAND SOUND,
Saturday, July 4.

The first day of race week at Larchmont began on Saturday, July 4, and on that day the annual regatta was sailed. The weather conditions were good, and there was a good list of starters.

The wind at the start was S. S. W., but later hauled to W. S. W. The course was a ten and three-quarter mile triangle. The first leg was from the starting line E. N. E., three miles to and around a buoy off Parsonage Point, thence S. three and seven-eighths miles to and around a buoy off Red Springs Point, thence N. W. three and seven-eighths miles back to the starting line. Boats in classes I and J covered this course three times.

The preparatory signal was heard at noon, and at 12:10 sloops in class J were started. Weetamoe had no competitor, and she covered the course and took a sail over prize.

The interest of the day was centered in Aspirant, the new boat Mr. William Gardner designed for the Hanan boys. She was only launched on Thursday last, and on her maiden race beat Mimosa II. over eight minutes elapsed time.

As Aspirant and Mimosa II. were not designed under the Larchmont Y. C. rule, they had to sail in a special class, while Effort and Mira sailed in the regular 43ft. class. However, all four boats started on the same whistle, and Effort beat Mimosa, boat for boat, over the course.

Aspirant was sailed by the Hanan boys, Mimosa II. was handled by her owner, Mr. Trenor L. Park. Mr. A. H. W. Johnson steered Mira, while Mr. Albert B. Hunt had the stick on Effort. Aspirant got the start, with Mimosa II. next. Mira was third over the line, with Effort well behind, but to windward. It was a reach to the first mark and Aspirant was first around. On the second leg, which was a beat, Effort caught and passed Mira, while Mimosa II. got away from Aspirant. Aspirant got the best of a shift of wind and again worked into the lead and was never headed. On the second time around Effort, by setting a spinnaker, caught Mimosa II. at the first mark, and the Crowninshield production could not catch her from that time on, although the boats were only separated by a few seconds at the finish. Unfortunately for Effort, the wind had shifted so that there was no windward work on the second round, otherwise she would have beaten Mimosa II. by a good margin. Beating is her strong point, particularly in a breeze, but it is not expected that she can reach with boats five or six feet longer on the waterline, built three years later with new and larger suits of sails.

In class M there were three starters, Breeze, Leda and Spasm. Leda, the smartest boat of the three, had the worst of the luck, and was the last to finish. Breeze got the race.

In class M yawls, Tern had matters all her own way, and defeated her only competitor with ease.

Oiseau turned tables on Alert in class N, and beat her over a minute elapsed time. No corrected time was given out by the committee, but it is likely that Alert won. Flosshilde withdrew.

Rochelle won in the 25ft. class, although a shift of wind put Chingachgook, which was leading at one time, well behind, and she was third to finish.

The C. F. Herreshoff 25ft. one design boats started at the same time the regular 30-footers did, but they were hopelessly beaten by the latter boats.

Two match races were sailed, one between Isolde and Eelin and the other between Challenge and Hebe. Isolde won easily, beating Eelin by nearly five minutes, while Challenge beat Hebe, which is now in heavy cruising trim, badly.

The summaries follow:

Sloops—Class J—Start, 12:10—Course, 3 1/2 Miles.			
	Finish.	Elapsed.

Challenge, W. D. Foote.....	4 29 25	3 34 25	
Hebe, H. Smithers.....	4 41 53	3 46 53	

The winners were: Weetamoe (sail over), Aspirant, Effort, Breeze, Tern, Hope, Alert, Rochelle, Dorothy, Jelly Tar, Knave, Trouble, Flim Flam, Arizona, Arrow, Gosling, Isolde and Challenge.

American Y. C.

MILTON POINT, LONG ISLAND SOUND,
Friday, July 3.

The annual regatta of the American Y. C. was held on Friday, July 3. Twenty-three yachts started, and all but one finished. The day was an ideal one, and a good southerly breeze held throughout the race. All the boats covered triangular courses.

The two sixties, Weetamoe and Neola, were sent away at 12:40, ten minutes after the preparatory. Shortly after crossing the starting line, Neola met with an accident that made it necessary for her to withdraw from the contest. The topmast on Neola was held by a metal casting. There was a flaw in this and it broke when subjected to a strain. The topmast slipped down a few inches, which allowed all the stays to become slack, and when the spar was thus without support snapped and fell off to leeward. The boat was brought up in the wind and the wreckage cleared away. No one was hurt, and she proceeded to City Island to make repairs. Neola has been the unlucky boat in this class, and she has met with several accidents. When Neola withdrew, Weetamoe was without a competitor, and was forced to sail over the course alone.

There were four starters in the 43ft. class. Mimosa II. and Effort had a rather close race, but the former boat won by less than three minutes. Mira beat Hebe by a good margin.

At 12:45 boats in the 30ft. class were sent away. There were only two starters, Flosshilde and Mimosa, and the former boat won by less than two minutes.

In the raceabout class four boats started. Mavis won by less than a minute from Jolly Tar, the second boat.

Houri, one of the Larchmont 21-footers, was disqualified for fouling one of the marks. The summary follows:

Sloops—60ft. Class—Start, 12:40.			
	Finish.	Elapsed.	
Weetamoe, H. F. Lippett.....	3 46 53	3 06 53	
Neola, George H. Pynchon.....	Disabled.		
Sloops—43ft. Class—Start, 12:45.			
Mira, C. L. Poor.....	4 28 31	3 43 31	
Mimosa II., T. L. Park.....	4 08 07	3 23 07	
Hebe, H. B. Smithers.....	4 38 50	3 53 50	
Effort, F. M. Smith.....	4 11 03	3 26 03	
Sloops—30ft. Class—Start, 12:50.

The winners were: Weetamoe, Mimosa II., Flosshilde, Mavis, Rascal, Dorothy, Bairn and Jeebe.

Unqua-Corinthian Y. C.

AMITYVILLE, LONG ISLAND,
Saturday, July 4.

The annual open regatta of the Unqua-Corinthian Y. C. was sailed on Saturday, July 4. A fresh steady S. W. breeze held throughout the race. The preparatory was given at 2:30 and boats in class A were sent away ten minutes later. The summaries follow:

Class A—Sloops—Course 10 Miles—Start, 2:40.			
	Finish.	Elapsed.	
Eileen, Blecker Brothers.....	5 05 50	2 25 50	
Restless, R. G. Loomis.....	5 16 47	2 36 47	
Don, Mr. Macy.....	5 08 32	2 28 32	
Edice, Delancey Smith.....	5 07 22	2 27 22	
Class B—Catboats—Start, 2:45.			
Dorothy, Southard Brothers.....	5 05 43	2 20 43

Ruth, Stewart Paterson.....	4 54 46	1 54 46	
Florence, Edgar Ruwe.....	4 40 10	1 46 10	

The winners were Eileen, Dorothy, Toby, Teaser and Florence.

Atlantic Y. C.

SEA GATE, LONG ISLAND,
Saturday, July 4.

The Atlantic Y. C. held open races for classes J and under on the afternoon of July 4 over the usual courses in the lower bay. The regatta was sailed in a light wind, and boats known to be fast in such conditions were generally victorious. Eighteen started the contest, all but one of which finished.

Had the breeze held strong and true throughout the event, a most interesting race would have resulted. Toward the latter part the wind fell from seven knots to not more than four. This made the finishes slow and lacking spirit. Class N boats going outside to West Bank Light and return from the start off Sea Gate were sent over the journey but once. The other boats went twice over a course from the start to marks off Fort Hamilton, Marine and Field Club and Ulmer Park.

Before the race much interest was centered in the competition for the 30-footers Bobtail, Bagheera and Vivian II. In the faint zephyr stirring Bobtail ran away from the others, and when the race was ended after one round of about 5 1/4 miles, led Bagheera by 6m. and Vivian II. by 12m. 10s. These boats had close hauled work out to West Bank Light and a broad reach home.

In class P, Vagabond gave the other boats a bad drubbing, defeating Karma 16m. 4s., Cockatoo 16m. 34s., Ogeemah 17m. 35s., Corona 21m. 35s., and Kate 21m. 50s. Kate was given an allowance of a minute a mile, which made her corrected time the second best of the class.

In class Q, the old rivals Spots, Wraith and Wink met. The latter was poorly handled, and made a weak showing. Spots beat Wraith 5m. 15s., and Wink 22m.

Six 15-footers started, an unusual number for this smallest sloop class. A new creation named Apuka II. sailed her first race on Gravesend Bay and won. Peanut made her initial appearance of the year, but did not finish.

Boats sailing the inside courses had a spinnaker run to Fort Hamilton, a reach to the Marine and Field mark, windward work to Ulmer Park and still more on the leg home to the start off Sea Gate. After the racers had rounded the buoy off the Fort the second time the breeze fell and they had hard work getting home. The summaries follow:

Sloops—Class N—Start, 3:10.			
	Finish.	Elapsed.	
Bobtail, E. F. Luckenbach.....	4 42 00	1 32 00	
Bagheera, Hendon Chubb.....	4 48 00	1 38 00	
Vivian II., S. E. Vernon.....	4 54 10	1 44 10	
Sloops—Class P—Start, 3:15.			
Vagabond, T. A. Vernon.....	5 08 00	1 53 00	
Karma, J. C. Erskine.....	5 24 04	2 09 04	
Cockatoo, W. A. Barstow.....	5 24 34	2 04 34	
Ogeemah, Brophy & Mackay.....	5 25 25	2 10 25	
Corona, J. E. Beggs.....	5 29 35	2 14 35	
Kate, yawl, J. S. Negus.....	5 29 50	2 14 50	
Corrected time: Kate, 2:08.50.			
Sloops—Class Q—Start, 3:20.			
Spots, D. D. Allerton.....	5 30 00	2 10 00	
Wraith, Calvin Tompkins.....	5 35 15	2 15 15	
Wink, M. Grundner.....	5 52 00	2 32 00	
Sloops—Class R—Start, 3:20.			
Apukwa II., E. S. Tefft.....	5 38 38	2 18 38	
Constance, F. D. Prentice.....	5 42 10	2 22 10	
Scalawag, E. S. Ludlow.....	5 43 28	2 23 28	
Eileen, F. J. Havens.....	5 57 50	2 37 50	
Pickaninny, E. H. Low.....	5 58 00	2 38 00	
Peanut, F. L. Wing.....	Did not finish.		

The winners were: Bobtail, Vagabond, Spots, and Apuka II.

Stuyvesant Y. C.

COLLEGE POINT, FLUSHING BAY,
Sunday, June 28.

The Stuyvesant Y. C. held their annual club handicap regatta Sunday, June 28. The course was from a stake boat anchored off the club house, around College Point buoy, thence around buoy at southern end of Riker's Island to stake boat. The breeze was very light from the N. E., and the yachts were called in at the end of the first round, as the tide was too strong and the wind rapidly falling. Summaries are as follows:

	Start.	Finish.	Elapsed.	Corrected.
Pinochle, J. Babst.....	12 20 00	2 20 08	2 06 08
Teddy, Jr., E. Rae.....	12 20 00	2 05 21	1 45 21
Eleanor, J. McGregor.....	12 15 00	2 05 03	1 50 03	1 43 03

City of Boston.

ANNUAL OPEN, CITY POINT,
Saturday, July 4.

The annual open race of the City of Boston, sailed off City Point, on Saturday, July 4, was one of the most successful in many years. There were in all 43 starters, all but 3 of which finished. At the start there was a light breeze, east-northeast, which hauled to east-southeast and became stronger. For the most part the yachts racing were old-timers that have been out-built by the new racers of the M. Y. R. A., and they made good racing all around. A new feature was the introduction of classes for power boats, sailed under the rules of the American Power Boat Association. There were a number of entries in these classes, and rare sport was furnished. The sailing classes raced under the rules of the Boston Bay Yacht Racing Association.

In the first class were the 25-footer Calypso and the 30-footer Elfreda. Calypso got the best of the start, and in the first few tacks was placed where she could backwind Elfreda every time. They had a close race all over the course, Calypso winning out by 50s. In the second class Ida J. and Owaissa were out ahead at the start, with the rest of the class bunched. Thordis pulled up through the bunch on the windward leg, and came home an easy winner, beating the time of the leader in the first class. The shift and increase of the wind were largely responsible for this. Cleopatra was over the line first at the start of the third class, but in the light air Wawenock walked out ahead and won easily. In the Dorchester Y. C. one-design dories, Vera got the start and led all over the course. In the sailing tender class the Stickney boat got away first and was never headed.

There were three starters in the cabin power boat class. Dorothy got the start and held it to the finish. Hester, a steam launch, withdrew, and Wide Awake took second place. In the open power boat class there was a great start, the little boats going over the line well bunched, churning the water up after them. Dan D. was nicely timed and went over the line with the whistle and led over the course, although Vivace kept her hustling all the time. The ratings of the power boats have not yet been figured out, and there is likely to be changes in the corrected times. The summary:

First Class—30ft. and Over.		Elapsed.
Calypso, A. W. Chesterton.....	1 34 00	
Elfreda, Hall & Johnson.....	1 34 50	
Second Class—25ft. and Under 30ft.		
Thordis, C. A. Heney.....	1 33 00	
Emma C., F. D. Perkins.....	1 36 42	
Eclipse, A. F. Leary.....	1 37 28	
Kit, H. B. Whittier.....	1 37 29	
Awaisa, Walter Kelly.....	1 39 05	
Cricketer, James Raymond.....	1 41 55	
Ida, J., C. C. Collins.....	1 47 34	
Third Class—20ft. and Under 25ft.		
Wavenock, Coombs & Seymour.....	1 25 32	
Usona, A. A. Lincoln.....	1 32 08	
Cleopatra, F. F. Crane.....	1 34 31

Atlantic Y. C.

OCEAN RACE FOR SCHOONERS,
July 4 to 5.

The second ocean race for schooners under the auspices of the Atlantic Y. C. was a disappointment. An early effort was made to get entries, but only three boats came to the line, all owners seeming unwilling to enter a long event starting on the holiday.

The race, which was to Fire Island Lightship and return, was won by Edward R. Coleman's Hildegard. Commodore Robert E. Tod's flagship Thistle was obliged to withdraw because her owner had made an unbreakable engagement to dine Sir Thomas Lipton at the Sea Gate club house in the evening. J. G. N. Whittaker's Iroquois ran aground on Roamer shoal and put back to the anchorage off Sea Gate as soon as free.

The 86 mile course lay from the start off Sea Gate S. S. W. 3/4 miles to the bell buoy at the entrance of Swash Channel, 2 1/4 miles S. E. by S. to the Red Buoy, 1 mile S. E. by S. 1/2 S. to buoy No. 2, then 36 1/2 miles E. by S. to Fire Island Lightship. The return journey was the same with compass bearings reversed.

The race was started a bit after 6 o'clock A. M. in a four knot breeze E. N. E., which gave the boats a reach to the Swash Channel bell buoy. The preparatory signal was fired at 6 o'clock. Fifteen minutes later the starting gun was sounded. The yachts had five minutes to get over the line before the handicap gun. Hildegard went over 35 seconds after the handicap signal, and Iroquois 1 minute and 22 seconds after. Thistle crossed within the time.

From 9 o'clock to 1 o'clock the breeze fell to almost a flat calm. It strengthened slightly soon afterward and

allowed Hildegard to lay her course to Fire Island Lightship some 26 miles away. She was leading Thistle and Iroquois by three miles when the former withdrew and the latter ran aground.

Hildegard rounded the lightship some time about midnight. She did the whole course of 86 miles in 21 hours 25s. actual time. The next ocean race of the Atlantic Y. C. will be held at the end of the New York Y. C. cruise. The event is open and a good entry is expected. The boats start from Brenton's Reef Lightship on the morning of Monday, July 27, and proceed to Nantucket Shoal Lightship and from there home to Sea Gate, a distance of 297 nautical miles. The summaries of the ocean race July 4 to 5 follow:

	Tonnage.	July 4, A. M.	July 5, A. M.	Elapsed.
Hildegard.....	145.97	6 20 00	3 20 00	21 10 00
Iroquois.....	92.79	6 20 00	Withdrew.	
Thistle.....	235.00	6 19 18	Withdrew.	

Eastern Y. C.

MARBLEHEAD, MASS.,
Saturday, July 4.

In a good, wholesome southerly breeze, with a lively little chop, there was good sport in the special open race of the Eastern Y. C. on Saturday, July 4. In the 25ft. class Great Haste got the best of the start, but was crossed soon after by Sally VII. and Chewink III. On the way out to the windward mark Sally led Chewink III. Chewink III. carried away her peak halliards and was forced to withdraw. Great Haste, by keeping to the shore, got the better of Sally VII. and turned the windward mark first. On the spinnaker run Sally VII. closed up on Great Haste and turned the second mark in the lead, which she kept to the finish. In the 22ft. class Urchin got the best of the start, while Medric and Opitsah V. were in the middle of the bunch. On the beat to windward Medric pulled out ahead and held the lead to the finish. In the 21ft. class Rooster I had things all her own way. There were 18 starters in the 18ft. knockabout class, and all crossed the starting line within a minute and a half of the whistle. On the windward leg Domino got the lead and held it to the finish. The summary:

25-footers.		Elapsed.
Sally VII., L. F. Percival.....	2 00 28	
Great Haste, T. K. Lothrop, Jr.....	2 01 27	
Chewink III., F. G. Macomber, Jr.....	Disabled.	
22-footers.		
Medrick, Herbert White.....	2 11 11	
Opitsah V., S. H. & H. I.....	2 12 40	
Urchin, J. B. Greenough.....	2 15 30	
Chief, S. C. Winsor.....	2 22 25	
Clotho, C. D. Lanning.....	2 22 58

Seawanhaka-Corinthian Y. C.

OYSTER BAY, LONG ISLAND SOUND,
Saturday, July 4.

The Seawanhaka-Corinthian Y. C. held a race for the raceabouts and the one-design 15-footers on Saturday, July 4. The boats sailed over the inside courses in a light S. W. wind. The summary follows:

Raceabouts—Start, 3:20.		Finish.	Elapsed.
Mystery, Johnston De Forest.....	5 40 43	2 20 43	
Nathalie, F. G. Stewart.....	5 41 10	2 21 10	
Seawanhaka 15ft. One-Design Class—Start, 3:25.			
Sabrina, C. W. Wetmore.....	5 21 39	1 56 39	
Imp, H. H. Landon.....	5 27 06	2 02 06	
We Wean, R. L. Cutlbert.....	5 28 33	2 03 33	
Cayenne, C. F. Hoyt.....	5 35 08	2 10 08	
Bobs, W. A. W. Stewart.....	5 40 35	2 15 35	
Brownie, R. W. Gibson.....	5 41 08	2 16 08	
Bairn, W. J. Matheson.....	5 41 09	2 16 09	
Olita, H. C. Rouse.....	5 41 10	2 16 10	
Alys, F. R. Coudert, Jr.....	5 42 26	2 17 26	
Bat, J. A. Garland.....	5 42 34	2 17 34	
Fly, W. E. Roosevelt.....	5 42 39	2 17 39	

The winners were Mystery and Sabrina.

Shelter Island Y. C.

SHELTER ISLAND, L. I.,
Saturday, July 4.

The yachting season of the Shelter Island Y. C. was opened on the afternoon of July 4 with events for classes N and R. There was a light wind blowing W. by S. which drove the boats over the courses in fair time.

In class N, George Trowbridge Hollister's Kalmia won from Otto E. Lohrke's Senta by 1m. 30s. corrected time. For competition in class R this year two cups have been offered, one by Mr. Hollister to be contested for on the point system. The number of victories will determine the winner of the club trophy. The system in use at the Shelter Island Y. C. gives a boat 1 point for entering and finishing a race and 1 additional point for every craft she defeats.

Six craft started in class R. The race was won by the Iris, a new creation built this winter for Gustave Piel, of Manhattan. Theodore Brigham, designer of the one-design class R boats, sailed her. Iris led her nearest competitor, Psi, by 22 seconds.

Three cups have been offered for competition in class R. John W. Webber offers one open to all craft on the point system. A cup given by Dr. G. W. Little is to be sailed for on the same basis, competition, however, being

open to one-design boats only. This shuts out Arrow in the first race. Commodore James Weir, Jr., offers a trophy to be won by the class R boat securing the greatest number of victories. The summaries follow:

Sloops—Class N—Start, 2:10.			Finish.	Elapsed.
Kalmia, G. T. Hollister.....	5 01 57	2 51 57		
Senta, Otto E. Lohrke.....	5 03 11	2 53 11

Corinthian Y. C.

MARBLEHEAD, MASS.,
Saturday, July 4.

The Fourth of July invitation race of the Corinthian Y. C. was spoiled by nearly all of the yachts starting sailing over the wrong course, through mistaking turning marks. All of the 25-footers sailed the wrong course. Opitsah V. was the only 22-footer to sail the right course. Six boats sailed over the right course in the 18-foot class, the Question getting first place after a good race. Thistle was the only raceabout to sail the right course. This was the case with Narcissus in class A, handicap, and Carmen in class B, handicap. The summary:

25-footers.		Elapsed.
Sally VII., L. F. Percival.....	Sailed wrong course.	
Chewink III., F. Macomber, Jr.....	Sailed wrong course.	
Great Haste, T. R. Lothrop, Jr.....	Sailed wrong course.

Beverly Y. C.

BUZZARD'S BAY, MASS.,
Saturday, July 4.

The Corinthian race of the Beverly Y. C. was sailed in Buzzards Bay on Saturday, in a light, fickle, north-east breeze. On the spinnaker run down the bay the 30-footers were all bunched. On the beat home Young Miss and Mashnee came out of the bunch and sailed a close race to the finish, Young Miss winning by 15s. The light wind suited the Herreshoff 21-footer Terrapin, and she led her class nearly all the way. Krieker won handily in the fourth class cats, but was protested by Hod for fouling a mark. In the 15-footers Spider was again a winner. The summary:

30-footers.		Elapsed.
Young Miss, D. L. Whittemore.....	2 57 09	
Mashnee, R. W. Emmons 2d.....	2 57 24	
Quakeress, W. F. Harrison.....	2 58 09

New York Y. C. Cruise.
FLAGSHIP DELAWARE, NEW YORK, July 1, 1903.
GENERAL ORDERS NO. 2.
The squadron will rendezvous at Glen Cove on July 6, 1903.
Captains will report on board the flagship at 4:30 P. M.
The programme for the cruise, weather permitting, will be as follows:
Friday, July 17, squadron run, Glen Cove to Morris Cove.
Saturday, July 18, squadron run, Morris Cove to New London.
Sunday, July 19, at New London.
Monday, July 20, squadron run, New London to Newport.
Tuesday, July 21, squadron run, Newport to Vineyard Haven.
Wednesday, July 22, squadron run, Vineyard Haven to Newport.
Thursday, July 23, at Newport. The Astor cups.
Friday, July 24, at Newport. The Owl and Game Cock colors. In the evening the squadron will illuminate.
The Regatta Committee will issue instructions for runs from port to port and for all other racing events.
The commodore's cups will be sailed for during the cruise.
Captains are requested to supply their vessels with N. Y. C. night signals.
The captains and their guests will be welcome on board the flagship at any time.
Attention is called to the routine published in the club book.
FREDERICK G. BOURNE,
Commodore N. Y. Y. C.
C. L. F. ROBINSON,
Fleet Captain N. Y. Y. C.

Duxbury Y. C.
SOUTH DUXBURY, MASS.,
Saturday, July 4.
The second race of the Duxbury Y. C. was sailed in Duxbury Bay on Saturday, July 4, in a whistlesail, north-east breeze. In the 18ft. class Miladi II. won, but lost on protest of Wink. Challenge won a good race in the handicap class, and Solitaire won easily in the sprint class. The summary:
18ft. Knockabouts.
Miladi II., F. R. Adams.....Elapsed.....0 53 05
Wink, L. B. Goodspeed.....0 54 47
Osprey, A. Train.....0 57 39

YACHTING NEWS NOTES.
For advertising relating to this department see pages ii and iii.
We are indebted to Mr. Everett Paine, secretary of the Corinthian Y. C., of Marblehead, and Mr. Lawrence Whitcomb, of the Beverly Y. C., for copies of their club books.

Canoing.
Prizes for Canoeists.
In order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.
The prizes will be as follows:
First, \$50.00.
Second, \$25.00.
Third, \$15.00.
Fourth and Fifth, \$10.00 each.
Sixth to Eighth, \$5.00 each.
I. The cruise must be actually taken between May 1 and November 1, 1903.
II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.
III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.
IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.
V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.
VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
VII. Stories should contain not less than five thousand words, written on one side of the paper only.
VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, N. Y., on or before December 1, 1903.

A. C. A. Racing Rules.
101 CLARK STREET, Brooklyn, June 29.—*Editor Forest and Stream:* The following amendments and changes

in the existing racing regulations of the American Canoe Association are proposed, to be published by you, and voted on by the executive committee after due notice, as provided in Chapter XIII. of the By-laws, and Rule XXIII. of the Racing Regulations:
Rule I.—Amend first paragraph on page 26 of 1902 Year Book to read (substantially) as follows: "All sailing races of the A. C. A., except such races for prizes as are by deed-of-gift defined as prizes for 16ft. by 36in. class, shall be open to both classes of canoe."
Rule II.—Amend first paragraph by the addition of the following: "No applicant for membership in the A. C. A. shall be allowed to race at the regattas of such Association: the participants in such regattas being limited to duly elected members in good standing."
Rule VI.—Amend the second paragraph, fourth line, as follows: "The prizes for any one camp shall be uniform in shape and design, as far as the financial resources of the Association will permit; and in the event of their not being uniform in shape and design, the Regatta Committee shall follow the spirit of this rule as far as it is possible." Also add to this paragraph: "No so-called 'Club' prizes will be awarded where such racing events are recruited, at camp, from members who are not members of such clubs. This to apply to club sailing, club tours, and club war canoe races."
Rule X.—Amend the last paragraph, leaving it to the discretion of the Regatta Committee to determine whether members shall be present in camp two days before racing, by striking out the words, "except in war canoe races."
Rule XIII.—Amend, by striking out the entire second paragraph, relative to disability by capsizing. This rule militates against the newer racing men, and, in view of the limited sail area now prescribed, is unnecessary.
J. K. HAND,
Chairman Regatta Committee.

Rifle Range and Gallery.
Fixtures.
July 6-7.—New Haven, Conn.—South New England Schuetzen Bund annual schuetzenfest, under the auspices of the Independent German Rifle Company. H. C. Young, Sec'y.
Adjustment of Sights.
ELIZABETHPORT, N. J.—*Editor Forest and Stream:* I suppose that a great many of the brotherhood of sportsmen, who shoot rifles, have at times endeavored to apply a new set of sights to their own guns. Of course, when a new set of sights is purchased, the rifle can be sent away to be sighted; but many of us ourselves would like to put them in, and we try to do so in the orthodox manner by shooting from a rest and tapping the sight to one side or the other as the bullets fly to the right or left of the mark.
It is, of course, absolutely necessary to test the sights by shooting for elevation, but an experiment which I tried a short time ago convinces me that for lining a gun sideways it is not absolutely necessary to fire it at all. I had occasion to put a full set of Lyman sights on a Marlin rifle, and to line them sideways I proceeded as follows: First, I clamped the gun lightly in a vise, padding the jaws to avoid marring it; then I passed a piece of fine silk fishing line through the barrel. This line I passed through the primer hole of an empty shell and knotted it outside. By inserting the shell in the breech and drawing the line tight, I had a straight line from the center of the breech through the barrel, coming out at the muzzle. I now led this line some fifty feet away and moved it to the right or left until I had it coming out of the center of the muzzle, verifying this by measuring with a micrometer gauge. When I got it so that it came exactly out of the center of the muzzle, I made it fast to a tack in a board at a distance of fifty feet away. Then went back to my rifle and set my sights on the tack, using it as a bullseye. After this, I took the rifle out and tested it at a range first of 25yds., and then of 50, shooting with and without a rest, and I found that my side alignment was perfect.
One can usually set for elevation in a very few shots, but it is not always so easy to adjust a front or rear sight sideways, and it appears to me that this method of the string and tack is somewhat of a labor saver.
BUD.

Our Own Rifle Club.
HOBOKEN, N. J.—The weekly meeting of Our Own Rifle Club was held June 30. A handicap contest took place. J. Ostermeier won the medal. The team contest scores follow:
Bauder's Team. L. Bittel's Team.
Bauder117 L. Bittel107
Ostermeier98 J. Mertz86
F. Mertz77 Gabriel111
W. Coley71 N. Mauder64
C. Ebner65 F. Besson105
J. Schneider85-513 G. Prigge79-552
The averages and handicaps in the present medal tournament of Our Own Rifle Club are as follows:

International Revolver Match.
In the International revolver match the American team began its competition on June 30, at Walnut Hill, Mass. The French team shot on July 2, at Paris.
The aggregate of the American team score was 7,889 points, an average of 525 14-15 points.
The conditions of the match are fifteen men on a side, 00 shots per man at 50yds., on the Standard American target, 8in. bullseye, any six-shot revolver; maximum length of barrel, 12½in., maximum weight of barrel, 2¼lbs., minimum trigger pull 3lbs., any open sights, any ammunition. The scores to be shot between 8 A. M. and 6 P. M. Sighting shots allowed before beginning the score.
The scores, which include 515 points made at Paris, and received at Walnut Hill by cable from Dr. Sayre, of New York, who is acting as umpire for the American team, follow: Oscar

I. Olsen, Duluth, Minn., 554; B. F. Wilder, New York, 543; R. S. Hale, Boston, 540; J. A. Dietz, Jr., New York, 534; W. A. Smith, Springfield, 532; C. S. Axtell, Springfield, 530; Louis Bell, Boston, 527; Thomas Anderton, Boston, 523; J. B. Crabtree, Springfield, 519; J. R. Calkins, Springfield, 519; E. E. Patridge, Boston, 517; R. H. Sayre, New York, 515; J. T. Humphrey, Boston, 513; William Amory, 2d, Boston, 512, and C. L. Bouve, Boston, 511; Grand total 7,889.
Mr. C. F. G. Armstrong, of Boston, was selected as a substitute in case that Dr. Sayre, who was in Paris, did not shoot for the American team in that city, as prearranged. Mr. Armstrong shot, scoring 517 points; but as Dr. Sayre had shot in Paris, Mr. Armstrong's score was not available. Mr. Bouve shot once on the wrong target, and made 8, but it was a lost shot, and did not score.
There has been an unaccountable delay in forwarding some of the French scores. Those of MM. Keller, Dorien and Depasses, of Lyons, are the ones yet to be forwarded. The scores indicate that the American team has won by 200 points more or less. The scores received by the Union des Sociétés de Tir made by the French team in the Franco-American revolver match follow: M. Balme 469, M. Caurrette 502; Capt. Chauchat 524; Count de Castelbajac 547; M. Dufloy 541; M. Feugray 509; M. Lecoq 502; M. Leuvier 496; Molinier Paget 526; Capt. Merciaux 529; Adj. Paroche 466; Commandant Py 542, and M. Sartoris 462.

Trapshooting.
If you want your shoot to be announced here send a notice like the following:
Fixtures.
July 8-9.—Huntsville, Ala.—The Interstate Association's tournament, under the auspices of the Huntsville Gun Club. E. R. Matthews, Sec'y.
July 8-10.—Arkansas State Sportsmen's Association's thirteenth annual meeting and tournament, under the auspices of the Jonesboro, Ark., Gun Club, of which Matthews is Sec'y-Treas.
July 10.—Olean, N. Y., Gun Club sweepstake shoot. B. D. Nobles, Sec'y.
July 12.—Jersey City, N. J.—Shoot of the Hudson Gun Club. A. L. Hughes, Sec'y.
*July, second week.—Memphis, Tenn., Gun Club's tournament.
July 14-16.—The Americus, Ga., second annual interstate target tournament. H. S. McCleskey, Sec'y.
July 15.—Charlottesville, Va.—Shoot of the University of Virginia. G. L. Bruffey, Sec'y.
July 18.—Chicago, Ill., Gun Club's tournament. A. A. Walters, Sec'y.
July 20-22.—Winnipeg, Can.—Seventh annual trapshooting tournament of the Winnipeg Industrial Exhibition Association. F. W. Heubach, Gen'l Mgr.
*July 21-22.—Beaver Falls, Pa., Gun Club's tournament. W. R. Keeler, Sec'y.
July 30-Aug. 1.—La Crosse, Wis.—The Interstate Association's tournament, under the auspices of the La Crosse and Viroqua gun clubs. John M. Moore, Sec'y.
*Aug. 6-6.—Brownsville, Pa., Rod and Gun Club's tournament.
Aug. 12-13.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selember, Sec'y.
Aug. 12-15.—Toronto, Ont.—Annual tournament of the Dominion Trapshooting and Game Protective Association. A. W. Throop, Sec'y-Treas., Ottawa, Can.
Aug. 18-20.—Grand Rapids, Mich.—Second annual target tournament of the Consolidated Sportsmen's Association of Grand Rapids; \$1,000 added. A. B. Richmond, Sec'y.
Aug. 19-20.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selember, Sec'y.

Sept. 15-17.—Indianapolis, Ind., Gun Club opening or dedication tournament. W. T. Nash, Sec'y.
*Sept. 23-24.—Scottsdale, Pa., Gun Club's tournament. R. S. Deniker, Sec'y.
Sept. 23-24.—Scranton, Pa.—The Interstate Association's tournament, under the auspices of the Scranton Rod and Gun Club. J. D. Mason, Sec'y.
Sept. 28-29.—Louisville, Ky.—First day, State championship at targets; second day, State championship at live birds. J. S. Phelps, Jr., Sec'y.
*Oct. 6-7.—Allegheny, Pa.—North Side Gun Club's tournament. L. B. Fleming, Sec'y.
Oct. 8-9.—Dalton, Ohio, Gun Club's fifth annual tournament. H. Santmyer, m'gr.
Oct. 14-17.—West Baden, Ind., Gun Club tournament; \$500 added.
Oct. 23-24.—New London, Ia., Gun Club tournament. Dr. C. E. Cook, Sec'y.
Saturdays.—Chicago.—Garfield Gun Club; grounds W. Fifty-second avenue and Monroe street. Dr. J. W. Meek, Sec'y.
*Member of Western Pennsylvania Trapshooters' League. Chas. G. Grubb, Sec'y, 507 Wood street, Pittsburg.
**Members Southern Trapshooters' Game and Fish Protective Association. J. J. Bradfield, Sec'y, Vicksburg, Miss.

DRIVERS AND TWISTERS.
Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.
The daily press recounts that noses, fingers, eyes, etc., do not register powder pressures accurately on July 4.
A ten-man team contest is announced to take place on July 11 between the Lehigh Rod and Gun Club, of the Bethlehems, and the Independent Gun Club, of Easton, Pa.
The Poughkeepsie, N. Y., Gun Club has developed a number of very skillful trapshooters, as the scores, published elsewhere in our columns, will show.
The Exeter, N. H., Sportsmen's Association announces a shoot to be held on Labor Day; every one invited.
The receiving teller's department of the National Gun Club is now open for business, and the captains and lieutenants will each receive guerdon if each one sends in the largest number of applications for membership to the president, Mr. John M. Lily, Indianapolis, Ind.

At Lancaster, Pa., on July 1, shooting each at 200 targets, the famous quartet now journeying through Pennsylvania, made scores as follows: W. R. Crosby 191, J. A. R. Elliott 181, E. D. Fulford 174, J. R. Hull 160.

In a match at 100 live birds, on the grounds of the Keystone Shooting League, Holmesburg Junction, Pa., July 4, Mr. A. J. Felix, of Philadelphia, defeated Mr. A. J. Miller, of Camden, by a score of 90 to 77.

At Pittsfield, Mass., in the contest for the Peters loving cup, July 4, four teams respectively representing Greenfield, North Adams, Dalton and Pittsfield, contested. Pittsfield won by four points.

Mr. W. R. Crosby continued his remarkably high form at Lebanon, Pa., in the competition of the Keystone Gun Club tournament. He was high average for the two days, June 29 and 30, by breaking 335 out of 345 in the programme events. He missed 8 on the first day and 2 out of 175 on the second day. Mr. J. A. R. Elliott was a close second.

In the third of a series of seven handicaps at Darby, Pa., July 4, given by the Clearview Gun Club, Mr. W. H. Downs, a one-armed shooter, won with a score of 55, 10 of which was allowance. At the same shoot, in a five-man team race, 15 targets per man, Armstrong's team defeated Carr's as follows: Armstrong's; Fisher 13, Downs 12, Ball 10, Leicht 10, Armstrong 9; total 54. Carr's team—Anderson 15, Jones 13, Hallowell 11, Ludwig 9, Carr 5; total 53.

The Riverside Shooting Association has fixed upon July 22 for a live-bird shoot, two events, one at 15 birds, \$5 entrance, and one at 10 birds, \$4 entrance, handicaps 26 to 32 yds. Birds extra at 25 cents each. Four moneys, Rose system, 9, 6, 3 and 1. If more than fifteen entries in the 15-bird event, then five moneys, 12, 9, 6, 3 and 1. Additional events at the pleasure of the contestants. The shoot will take place on the Riverside shooting grounds, Hackensack River Bridge and Paterson Plank Road, near Carlstadt, N. J. L. H. Schortemeier, manager.

On Thursday of last week the great thunderstorm which passed over New York, discharging prodigious quantities of rain, hail and lightning, did much damage, a part of which was bestowed on the gun colony. A bolt struck the chimney of 318 Broadway, in which is the business house of Messrs. Von Lengerke & Detmold. A brick by the shock was hurled across the street through a plate glass window, and a boat just taken out of the store while in process of shipment was so badly smashed by the falling bricks that it was for the time being rendered worthless.

The programme of the Interstate Association's Trapshooting tournament, given for the La Crosse and Viroqua gun clubs, on July 30, 31 and Aug. 1, at La Crosse, Wis., has added money \$360. There are provided ten programme events, alike each day, seven at 15 targets and three at 20 targets; entrance \$1.50 and \$2; to each event, \$5 is added. To manufacturers' agents' high average, three prizes, first, \$25; second, \$20, and third, \$15. Each day to the amateur making high average will be given \$5 to each of the five high guns. To the amateurs shooting through the programme will be given twelve high average prizes, as follows: \$10, \$9, \$8, \$7, \$6, and seven more of \$5 each. Lunch will be served on the grounds. Targets, 2 cents. Rose system, ratios 7, 5, 3 and 2, will govern. Guns and ammunition forwarded to J. E. Willing, La Crosse, will be delivered on the shooting grounds free of charge. Handicap 16 to 22 yds. Handicap committee, Messrs. H. C. Hirsch, I. S. Griffin and Dr. R. W. Baldwin. Mr. Elmer Shaner will manage the tournament. For further information address the secretary, Mr. John Moore.

BERNARD WATERS.

Riverside Shooting Club.

TOPSHAM, Me., July 4.—There were thirty-four shooters in attendance, at the shoot of the Riverside Shooting Club to-day. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Broke.

S. T. S. G. and F. P. A. Tournament.

THE twelfth amateur target tournament of the Southern Trapshooters' Game and Fish Protective Association, formerly known as the Mississippi Valley Trapshooters' Association, opened in Memphis, Tenn., on Thursday, July 2. There was no regular programme for the first day other than optional sweeps and some merchandise prizes, yet there were 200 targets shot by the most enthusiastic ones. The weather was good, though the sun shone hot, and there was a slight shower during the afternoon.

The best score was made by J. Skannal, the Shreveport champion, being 182 out of 200; Abe Frank was second with 181, with Faurete and Reiersen next with 179. Mercer and Bull, of Shreveport, made 174 and 173, thus putting the Shreveport lads well to the front as a squad.

First Day, Friday, July 3.

Considering that the Kentucky Trapshooters' League had a tournament same day at Louisville, and that next week the Arkansas State shoot comes off at Jonesboro, and also the Interstate shoot at Huntsville, Ala., there was a very large number of shooters faced the traps; in all, seventy men shot more or less during the day.

The weather was hot, though a moderate breeze came from the southwest, which tempered and cooled the sun's rays to a considerable extent.

Manager Abe Frank and his assistants had a busy time of it keeping things moving. As a late start was made, and there were some delays and annoyances at the traps, the last event on the programme was not finished, though some of the last squads shot when it was so dark that targets were scarcely discernible. This was especially hard on W. H. Heer, who traveled all the way from Wabash, Ind., and reached the grounds only in time to get into the last squad. He was called up with others, and shot ahead of his turn, and being dark, lost six out of his last 20, when a straight score would have put him on a tie for high average.

The targets were rather a hard proposition, and it is worth the reader's while to study the scores and see where the best shots went wrong.

The targets were speedy and rather an uneven lot, some high and some low. There were rather annoying, irregular pulling and trapping. It was a "no bang no bird" affair, shooting at pieces scored as results. There was a lack of management and squad hustlers that would have carried the shoot along faster and made it better for all concerned. True, several of the home boys assisted in keeping things moving, yet the secretary was overworked, and Mr. Schmidt, who had charge of the traps, was on the sick list.

The traveling men were numerous, and such fun as they had was a novelty to the uninitiated. Frank Faurete was the leader of absurdities. Shanahan was present, but he did not turn loose any of his pranks, waiting no doubt for the final wind up. The traveling representatives were: Irby Bennett and his lieutenants and privates were numerous. There were Messrs. F. M. Faurete, of Dallas, Tex.; Tom Divine, of Memphis; W. T. Frenz, Little Rock, Ark.; Louis Williams, of Nashville, Tenn., and G. H. Hillman, of same city; Col. J. T. Anthony, of Charlotte, N. C.; W. H. Heer, of Concordia, Kan.; Wm. Long, of Mount Pleasant, Tenn.; Maurice Kauffman and L. I. Wade, two well-known Southern gentlemen; L. Z. Lawrence, C. B. Spicer and Capt. Arthur W. du Bray.

The amateurs were numerous and as follows: John Skannal, C. L. Reiersen, W. Mercer, W. P. Buell, Jr., and John Jenkins, of Shreveport, La.; J. Fletcher, G. Hillman and Lee Moody, Birmingham, Ala.; S. P. North, Bond, Miss.; H. Bonebrake, Weatherford, O. T.; John Rohrer, El Reno, O. T.; C. H. Dixon, Joplin, Mo.; P. C. Ward, Walnut Log, Tenn.; N. P. O'Leary, Little Falls, N. Y.; John Canale, E. Girard, Wm. Yahnke, P. Poston, John Brignadello, W. H. Joyner, Ed. Coe and D. S. Weaver, Memphis, Tenn.; J. R. Duncan, Lewis, Tenn.; M. Starr, W. A. Davis, Mrs. Dr. Davis, Dr. Hansbrough and H. C. Bronough, Paducah, Ky.; Dr. N. C. Wilson, Savannah, Ga.; J. D. Duncan and D. P. Shannahan, Greenville, Miss.; Perry Benedict and Robert Saucier, New Orleans, La.; O. L. O'Connell, Chattanooga, Tenn.; Ed. Brady, Newbern, Tenn.; W. B. Powell, J. B. Coles and E. A. Arnold, Pine Bluff, Ark.; J. D. Proctor, Junction City, Ark.; A. J. Vaughn, G. W. Perry, Clarendon, Ark.; Wm. Brown, Chattanooga, Tenn.; Gordon Matthews, Jonesboro, Ark.; Abe Frank, Memphis, Tenn.; I. Y. Hill, Sheffield, Ala.; J. J. Bradfield, W. J. Fletcher, J. W. Hayes, L. R. Pinkston and W. H. Miller, Vicksburg, Miss.; J. F. Henderson, Woodstock, Tenn.; W. B. Hawkins and C. K. Hawkins, Woodstock, Tenn.; Ed. Baker, Griffin, Ga., and W. J. Hill, Paducah, Ky.

The high score for the day was made by Mr. Fletcher, the crack shot of Birmingham, who shoots well all the time and perspires freely. His total of 184 was very fine under the conditions; then Mercer, of Shreveport, with 182, and Park with 181 and another Memphis lad, Canale, 179. Skannal, 178, was the next high man.

Of the representatives, Heer was high with 178, but considering the circumstances of shooting his squad out of turn when it was too dark to see, he should have had at least 5 more to his credit. Faurete made 177, Kaufman 171 and Wade 168.

The event of the day was the Fabacher cup, and another new man got in the race. Mr. John Canale, of Memphis, made the excellent score of 47 out of 50, and won without a tie. Skannal and Mercer made 46. This brings four men into the shoot-off for the tie, as a different man has won at each of the four meetings for the year.

Owing to delay in the regular events the tie could not be shot the close of the programme, and will be shot first thing to-morrow. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Broke.
Targets:	15	15	20	20	20	25	20	20	20	20

Valley City Tournament.

VALLEY CITY, N. D.—Thirty North Dakota trapshooting enthusiasts met this week at Valley City and participated in a lively programme given by the gun club of that place. The weather was very rough the first day, and nobody shot over an 80 per cent. average. On the second day conditions were more favorable, and much creditable work was done. Agran, Guptill, Evander, Sprague and Dewey filled the points the first day, and Evander, Riehl, Guptill and Hensler the second. A twenty-four man team race after the programme stirred up much local interest, and the winners enjoyed a spread at the expense of the losers. The programme provided 175 targets each day. The scores:

KILLMORE.

IN NEW JERSEY.

Mountainside Gun Club.

West Orange, N. J., July 4.—The scores made at the shoot of the Mountainside Gun Club to-day follow:

Events:	1	2	3	4	5	6	7
Wethling	15	15	15	15	10	10	20
R Baldwin	13	15	11	13	7	...	19
C Ziegler	14	13	10	14	10	...	18
Hollum	13	9	11	12	9	10	...
McDonough	10	12	14	12	8	7	16
Beagle	12	9	11	13	8	9	17
C Ziegler	11	12	16
N Baldwin	7	7	12	8	15
Clarke	12	11	12
Pratt	8	7	11	15	8

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., July 4.—The local tournament of the Poughkeepsie Gun Club to-day was a success in every way. We had fifteen men shooting, eleven of whom shot through the whole programme. The strife for high gun lay between Tallman, Traver and Hans; Tallman was successful, however, in making highest average for the regular programme by scoring 90 out of the 100. Capt. Traver was a close second with 89 to his credit; Hans was next high with 85.

This was only a "little shoot," but we had some shooters with us to-day who were mighty glad they came.

Our next tournament will be on a larger scale, and then when some of the well-known trapshooters see what a fine ground we have, and how pleasant we can make it for them, they will be glad they came, too.

At the club shoot on Thursday, Smith, scoring 24, won the club cup; and Claymark, with a score of 22, won the Marshall cup:

Events:	1	2	3	4	5	6	7	8	9
Targets:	15	15	15	15	15	25	15	15	10
Marshall	9	10	8	9	11	16	6
Hans	13	14	12	12	13	21	10
Traver	14	13	13	13	13	23	14	15	9
Du Bois	11	15	10	12	9	20	11	...	8
Smith	11	12	13	14	13	16	12	...	5
Tallman	13	14	14	14	12	23	9

Perkins	8	14	15	12	...	20	14	8	9
Fenn	7	10	13	12	13	19
Briggs	11	5	9	6	11
Radcliff	4	2
Pickenpack	7	7	9
Bonney	6	8	11	3
Claymark	11	10	9	10	10	18	12
Van	11	...	10	10	...	12	...	5	...
*Marshall	13
*Smith	12
Borst	...	8	7	9	9	...	6

* Re-entry.

A new feature was brought out by the introduction of a new way of dividing the sweeps. A shooter could enter for targets only or targets and purse, or targets, purse and sweep. Different shooters could put in different amounts, multiples of 25 cents, in the sweep, and draw out in proportion to their investment. Each 25 cents in the sweep was one share; \$1 was four shares. Each share was counted one point.

The Rose system was used in the regular way to figure the purse, but for the sweep the Rose system points were taken and multiplied by the share points, and the product of the two were used as points to get the value. Thus: if two shooters tied on the score, but one put two shares in the sweep to the other's one, he would win twice as much sweep money. It worked to perfect satisfaction.

The B. A. A.

It was but a short time ago that the writer, while in Boston, received an invitation to visit the Boston Athletic Association's club grounds at Riverside, on the Charles River. To be a guest of the B. A. A. is for the time being to be one of them in good standing. The cordial greetings extended, the most excellent good fellowship existing at all times, are conspicuous among the many other qualities only found in men of their stamp, and which have made the B. A. A. known quite around the globe.

A limited membership of eighteen hundred, an average of four hundred on the waiting list, making it next to impossible to become a B. A. A. inside of four years, would indicate a condition of health inside those delightful portals.

Nature and good judgment combined have fitted this club out as few others can be.

The accompanying photos show the boat house on the banks of the river and the athletic and gun club house on the hill just above it. Happily indeed, are they located. There are field and aquatic sports almost under one roof, and under one management that "knows how."

The writer is greatly indebted to Mr. J. H. Daggett and his fellow members for an afternoon that he is fond of recalling.

T. E. BATTEN.

Exeter Sportsmen's Club.

EXETER, N. H., July 4.—The Exeter Sportsmen's Club held a small shoot at their grounds this afternoon. Mr. Albert S. Langley, captain of the team for five years, presented the club with a silver goblet, to be contested for every two weeks, with sliding handicap, until won consecutively three times by a member of the club.

In the contest for the cup to-day at 25 targets from magautrap, Dr. C. H. Gerrish scored 25, Albert S. Langley 25, Albert E. Moore 25, J. Warren Tilton 24, Chas. H. Bickford 22, Walter S. Carlisle 21.

In shoot-off at 25 targets, Langley broke 21, Gerrish 19, Moore 19.

Dr. Gerrish and Langley then shot at three 10-target matches

for a small purse, Gerrish having one dead target on each event.

First match: Gerrish 10 add 1; Langley 8.

Second match: Gerrish 8 add 1; Langley 10.

Third match: Gerrish 8 add 1; Langley 10.

Mr. Tilton and Mr. Langley then shot a 20-target match, Langley winning by a score of 20 to 15.

Mr. Langley having made a run of 40 straight, was offered a prize to continue for 10 more straight; he failed to make good, missing his 45th and 46th targets.

The club will hold an all-day shoot on Labor Day; everybody invited. Programme of same will be sent later.

Cincinnati Gun Club.

CINCINNATI, O., July 4.—The members of the Cincinnati Gun Club enjoyed themselves on the Fourth. The programme seemed to please every one. The purses paid well under the Rose system, 5, 3, 2. Grau carried off high gun honors, also \$33; Davis got second high gun. The events paid as high as \$8 for first and \$3.50 for third money. The one-half cent taken out for each target paid the high guns \$8 and \$6, and the three low guns \$4.50 each. Gambell, assisted by Mrs. Gambell, kept things moving inside and out, and paid off five minutes after the last event; and he also found time to donate a few by shooting through. Corry had the misfortune to break his gun early in the game. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Broke.
Grau, 18	13	14	13	12	12	13	14	14	14	15	134

THINGS AS THEY ARE.

WE print another communication upon the subject of preserves, in which the writer suggests that the owners of game parks should sell all that they have and give to the poor. To demand such a course of preserve owners only would manifestly be unfair. If those who have are voluntarily or on compulsion to divide up with those who have not, there are very many other classes of property which should be parceled out before the game preserves are broken up. The general multitude can do without the parks until after a division by the owners of stocks and bonds, bank accounts and cash, farms, horses, live stocks, merchandise, mines, mills and factories, food supplies, and all other possessions and substances and necessities.

But the rule to sell all one has and give to the poor is nowhere recognized as a practical course of conduct of life, unless it be by individuals whom their fellows regard as cranks. A Tolstoi may found a certain cult, but the brutality of a Tolstoi's deprivation of his family does not appeal to our sober sense as something to emulate. If an individual, in the Adirondacks or out of them, were to attempt to give all he had to the poor, a commission would be appointed to inquire into his sanity, and the courts would intervene to protect his wife and children. The writers who advocate the giving all away plan are not themselves so foolish as to attempt to put it into practice.

The communication printed is typical of much of the writing that finds its way into print in these times in discussion of social conditions and economic problems. It illustrates a certain prevalent state of mind; but we are convinced that it is in the end altogether futile. Granted that abuses exist in the acquirement and holding of game parks and fishing preserves, is it reasonable to anticipate that anything will ever come of railing at those who, having the means to gratify their desires, indulge in parks and preserves? Will any owner of lands or waters be persuaded by newspaper exhortations to take down his fences and trespass signs? On the contrary, is it not true that thus to preach a doctrine of share and share alike is only to fire in the air?

This is not to say that there are no mistaken public policies in permitting the woods and the waters to be fenced off; it is not to deny the existence of grave abuses, nor the possibility of devising a better way. We mean only to point out that the better way will never be found by a wholesale indictment of human nature and the social system. Instead of advocating the immediate realization of the millennium, when everybody shall own everything in common, it would be more to the point to devise ways and means to secure to the public a continued enjoyment of the rights and privileges now theirs as to the game and the fish.

We must approach this problem, as all others, with a recognition of the conditions which actually prevail. Things are as they are. Human nature is human nature. We may blame it for what it is, and write columns to prove that it ought to be something else; but in any present practical dealing with it we must take it as it is, and be governed accordingly. So with the existing system as to the holding of property and the recognition of property rights. We may picture an Utopia wherein delectable conditions will prevail, and no one may enrich himself at the expense of others or enjoy himself to their exclusion. But the rule now is that the individual is free to acquire land without limit, to control it as he may see fit, and to enjoy the exclusive right of its occupation and use. There might be a better system, but this is the one which is, and the one with which we must deal.

In a word, we have to do with things as they are.

There are under these conditions certain lines in which effort may reasonably be expended for the purpose of holding public rights. For instance, in waters which are public only in so far as their owners concede public fishing privileges in them. We have recently recorded that in New York certain streams which had been stocked with the State fish at the instance of local anglers had been acquired by new owners who posted them and excluded the public. There are doubtless many other streams as to which this same course of events may follow, unless steps shall be taken to prevent them. A prac-

tical expedient then in every such case would be for the community which is interested to secure from the land-owners, prior to any stocking by the Fish Commission, a ten years' lease of the fishing rights, the lease being in the name of a committee duly appointed to represent the local anglers. Such an instrument might well be made a condition precedent to the stocking of any waters at public expense. Other and better methods may be suggested; but whatever might be done in this way would be of vastly more account than limitless denunciation of the selfishness of those who grab the waters for themselves.

THE AMERICAN VICTORY.

THE victory of the United States rifle team in the international rifle match at Bisley, England, on Saturday of last week, affords just grounds for a feeling of national pride and for an expression of general national gratification.

To have possession of the Palma Trophy, emblematic of the world's championship in the highest forms of rifle competition, is an honor eagerly desired by all the leading nations of the earth. The number of aspirants for the honor is increasing. The recent contest was much broadened in cosmopolitan scope by the entries of nations never before represented in contests for the Palma Trophy. Already Great Britain has signified her intention to retake it in the international competition of 1904, if earnest British effort and talent can compass such undertaking.

The victory of the United States team was decisive. Opposed to it were the best teams of Great Britain, Canada, Norway, Australia, France and Natal. The team of Great Britain was the only one to make a close competition. It led at 800 yards, the first range, by a margin of three points over the United States team. The race at that range was very close, when it is considered that at 800 yards the possible was 600 points per team. At the other two ranges, 900 and 1,000 yards, the United States team made a decisive gain. At 900 yards it gained 11 points; at 1,000 yards it gained 7 more points, thus scoring 18 points over Great Britain at the two longer ranges, and winning by 15 points in the totals of all the ranges. The scores of the three leading teams are: United States, 1,570; Great Britain, 1,555; Canada, 1,518.

This victory is peculiarly complimentary as a testimonial to the energy and resourcefulness of the United States. In 1901 the Americans lost the Palma Trophy to the Canadian team by a score of 1,494 to 1,522. Last year the United States team contested for it at Ottawa, Canada, with Canadian and British teams as opponents, with results as follows: Great Britain, 1,459; United States, 1,447; Canada, 1,373. Since then our long-range riflemen have given the problem of the Palma Trophy much thought. Rifles, ammunition and technical manner of their use have all been given much study, with the resultant splendid performance at Bisley. Thus the American man behind the gun, the gun, and the ammunition were all equal to the exigencies of the situation.

While the victory itself has in it much for national felicitation, the advance in a better understanding among the citizens of the earth and the consequent addition to cosmopolitan comity are of material value in maintaining the peace of the nations. The hearty friendliness manifested between victor and vanquished and toward them by the British people and their visitors, is a phase significant of international good will. With the just feeling of pleasure which flows from the knowledge that the Palma Trophy will return to the land of its origin, there is cause for a still greater feeling of pleasure in the knowledge that with it are associated peaceful victories and a constant broadening of friendship between the nations.

DISCOURAGEMENTS OF PERSEVERANCE.

IF at first you don't succeed, try, try again. Keep everlastingly at it. There is no such word as fail. But what if you are hunting in Nevada? There it is permitted you to try, try, try again, but not another time. The new law takes care of that. "It shall be unlawful for any person to kill, catch, wound or pursue with an attempt to catch, capture, injure or destroy any number of deer or antelope exceeding three for any one season or year." The limitation, be it observed, is not confined to killing, but covers the pursuing. If the hunter shall have followed and lost two deer, he may try for one more, and losing that he may go back to camp, pull up tent pegs, and go home.

In Idaho the discouragement of perseverance is yet more stringent. It is there "unlawful during the open season of each year for any person to hunt, kill or capture more than one elk, two deer, one mountain sheep, one ibex and one mountain goat." Under these circumstances it behooves the Idaho elk or goat or sheep hunter to be a good shot. One unsuccessful stalk to get within rifle range, the bullet sent a trifle out of true, and the hunting for that coveted head is ended for the year.

It is a shooting game of miss and out. And sometimes the stakes run high.

There are men possessed by an ambition to display a mountain sheep's head of their own winning; and who, under the stimulus of that ambition, lay out in railway fares, non-resident hunting license fee, guide hire, pack outfit and provender, hundreds of dollars, travel thousands of miles, undergo no small degree of fatigue and privation, and all for a shot at one single animal. Whether captured or lost, that one single specimen is all the law allows them to hunt.

As human nature is constituted, there is some ground for the suspicion that the average man, made up of the average clay, will not count himself out on one unsuccessful shot, nor on many. He will reason with himself that the Idaho law does not say precisely what the framers of it intended, and he will be likely to persuade himself to another stalk and another shot.

AN ENCOURAGEMENT TO PERSEVERANCE.

IF the Idaho and Nevada big-game limitations discourage perseverance, the Illinois law relating to wildfowl, on the contrary, is a noble stimulus to industry and a direct incentive to big bags of ducks. The law is fearfully and wonderfully made; to parse it would be beyond the average Illinois high school pupil; but its author, though he did not know much about expressing himself in English, did have the courage of his convictions in making obligatory upon every duck shooter the killing of more than fifty ducks in a day. The law reads:

"That it shall be unlawful to kill, entrap, ensnare, or otherwise destroy any of the ducks, geese or brant mentioned in this section at any time for market or other commercial purposes, nor more than fifty by one person in one day."

The "nor" is equivalent to "or not" and the construction then is that it shall be unlawful to kill ducks for market, or not more than fifty by one person in one day. A person must kill more than fifty in a day; the smallest number he may kill in a day without violating the law is fifty-one. If he kills only fifty or any less number he has an unlawful bag, and is liable to a penalty of from \$15 to \$50 for each of the fowl.

While some States are endeavoring to restrain the excessive killing of game birds, Illinois enacts that no wildfowl hunter may stop short of fifty-one to his score. It is possible, however, that in practical operation the nothing-less-than-fifty-one condition may prove to be a powerful discourager of duck shooting, for where fowl are few and the game warden alert, the shooter who is dubious about securing his fifty-one will not dare shoot any, fearful lest he shall not achieve the limit of safety.

In his account of the strenuous and adventurous career of Raven Quiver, the Indian trader, Mr. Schultz has contributed an authentic chapter to the history of the old West. It is a graphic picture of the troubled ways of that régime; and the incidents described are highly suggestive of the large part the white man's baleful alcohol played in the decimation of the native. Raven Quiver and Fort Quiver were not unique; there were many traders and many forts of these types, each an active and far-reaching agency of Indian demoralization and ruin.

The Sportsman Tourist.

Some Old Time Plainsmen.

II.—Raven Quiver, the Trader.

RAVEN QUIVER, as certain Indian tribes called him, was probably the best known and the most successful of all the old time traders. His father was a Canadian, for many years a partisan of the American Fur Company. His mother was a Mandan, the most interesting of all the northwestern tribes. Although members of the great Sioux family, as shown by their language, they had otherwise nothing in common with the other tribes of that stock. Their religion was different, they lived in villages, raised crops of various vegetables and corn and manufactured pottery and colored beads. It may be that they were part Sioux and part of some other stock.

From his earliest youth Raven Quiver was an employe of the American Fur Company in one capacity or another, until the great firm, in 1865, wound up its affairs and sold out. His first employment was as errand boy and horse herder at Fort Benton, in charge of partisan or factor Dawson, a rough, burly, but kind-hearted old Scotchman. Dawson took a great interest in the youth, and one fall sent him on one of the company's batteaus to St. Charles, Mo., to attend school. Some time before, Raven Quiver's father had severed his connection with the company, and was then living on his fine farm in that State. When the holiday vacation came the lad set out to visit him. After several days' journey he approached the place which had been pointed out to him as his father's residence, and met him on the road. The old man was surprised and delighted, embraced his son and asked anxiously for news of his mother and old friends in the far-away Northwest. The evening was warm, and they sat for a long time on the rail fence bordering the road, talking of western matters. At last dusk came, the air grew chilly, and the old man shivered.

"My boy," he said, falteringly, "in yonder house lives a woman who considers that she is my wife, and two children of whom I am the father. I have not the heart to break the peace and contentment which there reigns; so, in taking you there I must introduce you as a friend from the West. But remember this: You are my favorite, my best loved child. Come, if you love me, and help me conceal the events of my western life, of which they know nothing."

Twice during many years of intimate acquaintance with Raven Quiver he reverted to this incident as the bitterest moment of his whole life. But such was his love for his father, and so perfect his control of his emotions, that he bore the ordeal of being introduced as a stranger into the home that was rightly his without showing in the least his real feelings. He met a pleasant faced, cheerful woman, who was very kind to him. He met a boy and girl who made friends with him at once, and insisted on his going shooting and fishing with them, and sharing all their childish pastimes. For ten days he remained there, having many long and intimate talks with his father, and then he returned to school, never to visit the place again. In after years the old gentleman lived a part of the time with him in the west, and when he died the greater part of his little fortune was found to be willed to the half-blood, who in all truth had been his favorite son.

Raven Quiver remained two years at school, and by diligent application learned to read, write and figure, and then he returned to Fort Benton. When the company sold out he scouted for the army several years, and led the expedition under Col. Baker which massacred eighty lodges of the Piegan Blackfeet on the Marias River, in January, 1869. He did this unwillingly, for he had many friends among the Piegans. But he had sworn to defend the flag, and, moreover, Col. Baker detailed two soldiers to keep close behind him and shoot him should he fail in any respect to carry out his orders. Baker was after Black Weasel's band for the murder of a settler named Clark, and for various depredations, but instead Heavy Runner's camp was struck just at the dawn of a bitterly cold morning. A terrible massacre ensued, men, women, and children being indiscriminately killed, and then burned on piles of their lodges and household effects. For his share in this the Piegans swore they would have Raven Quiver's life, and for some time he avoided meeting them, going on a prospecting expedition to the far north, until their anger in a measure cooled. But they never wholly forgave him, and for many years afterward, especially when drunk, made attempts to take his life. Raven Quiver eventually married a daughter of Heavy Runner, yet her brother, Red Eyes, was his worst enemy, and every time he got drunk would try to kill him. Raven Quiver bore all his abuse with more patience than could have been expected, foiling every attempt he made.

I must confess that I had not so much patience. He had taken a notion to pot me, too. One night he was howling around outside the post, carrying a Henry rifle and swearing that he would kill us if he had to watch two days for us to come out. "This thing has got to end," I said. "It's wearing on my nerves and I can't stand it any longer." I picked up a rifle and started for the door, but Raven Quiver stopped me. "Don't!" he said. "He ought to be killed all right, damn him! But there's my wife, you know; she thinks a lot of him; for her sake let's put up with it this time, and to-morrow, when he is sober, she'll give him a lecture."

So things went on for years, and it was mere luck that Red Eyes didn't get one or the other of us. I think if I had had my way, there would be fewer gray hairs in my head than there are. Yet Raven Quiver's way was the best. Red Eyes is a ranchman now of staid demeanor. He lives in a two-story house, owns a fine bunch of cattle and horses, has cut his hair, and wears the clothes of civilization. Twenty years ago who could have believed that the wild buffalo hunter of the plains would become civilized!

Soon after the Baker massacre, Raven Quiver gave up the army and joined a prospecting expedition. The members of it were mostly employes of the American Fur Company, and were well outfitted for the undertaking. Besides saddle and pack horses they had several wagons,

Raven Quiver himself owning and driving a three-yoke team of bulls. They used Indian lodges for shelter, and were prepared for anything that might happen, from a bad storm to an Indian fight. They struck the eastern foothills of the Rockies about forty miles from the Missouri, and traveled northward, keeping as near the mountains as possible. Every stream they came to was prospected for placer gold, but only a few colors were found, and late in the fall they finally arrived at Fort Saskatchewan, the Hudson Bay Co.'s post on the river of that name. Here the prospectors built several log houses and prepared to pass the winter. The endless forests and muskegs of the far north had a depressing effect upon Raven Quiver, the plainsman; he became homesick, longing to traverse again the high, dry, sunny prairies of the Missouri. It was a long distance from there to Fort Benton, five hundred miles and more. The snow lay two feet deep on the muskegs, and the weather was bitterly cold. Yet Raven Quiver, in spite of the remonstrances and warnings of his friends, started forth one morning on the long journey, accompanied by a French Canadian, who had also tired of life in the north. Each man rode a good horse. Strapped to their saddles were a couple of blankets, a few pounds of pemmican, and, except their rifles and ammunition, this was about all they carried for the long trip. They were several days passing the timber country, and when they finally came out of the deep snow on to the rolling plains, their scant store of food was gone. The weather continued cold, but still and clear. They expected to find plenty of buffalo and other game, but not a living thing was to be seen except an occasional wolf, coyote, or fox, and these kept well out of range. Raven Quiver had a vial of strychnine in his war sack, and nightly they put some of it in the manure of their horses, hoping that a hungry fox or coyote might eat it in that way and furnish them meat; but the baits were never touched. The further south they traveled the less snow they found, but still there was no sign of game, not even on the Bow or the Red Deer River.

On the morning of the sixth day after their food had given out, the Frenchman seemed to have lost his mind. Before, he had been continually praying to the Bon Dieu and the Virgin to show them the buffalo and preserve them from starvation. But now he babbled of his far away home, and the incidents of his childhood. His rifle, which he had tossed away, Raven Quiver picked up; he looked at it absently and refused to lay it across his saddle again. Finally he would not even guide his horse, and his companion was obliged to lead it. The young man's thoughts were sad. These plains were bare of life, yet they should have been dotted with buffalo. His companion had gone crazy; he himself was faint and weak from hunger; he had tightened his belt to the last possible notch. To-morrow—why to-morrow he also might lose his mind, and then both would perish. He felt that he could no longer defer killing one of their horses, yet he was loath to do so, for with but one animal they would be at the mercy of any wandering party of Indians. And again, the distances between the different streams was great; if they should be overtaken by a blizzard far from one of the timbered valleys, they would surely freeze to death.

Just when their situation seemed to be almost hopeless, the clouds suddenly broke away. In the head of a coulee near Belly River, Raven Quiver discovered a lone buffalo bull quietly feeding. By making a circle he succeeded in approaching the animal, still leading his companion's horse, and shot it. And then he hurriedly dismounted and began to cut it up. He gave the Frenchman a morsel or two from the nose, a bit of liver and tripe, a slice of kidney, which the poor fellow devoured ravenously, and he ate a little himself. Then, loading the two horses with the choicest parts of the animal, they went on down to the river and unsaddled on an island, where there was a great pile of driftwood handy for fuel. That night they passed chiefly in roasting and eating meat, and, strange to say, the Frenchman recovered his wits almost as quickly as he had lost them.

From there on to Fort Benton, more than two hundred miles, they were never out of sight of the buffalo, and killed meat whenever they needed it. At the Goosebill, a butte between the Marias and Teton rivers, a party of Blood Indians chased them. But they had taken great care of their horses, and were finally enabled to get away, although for a time they were in great danger, as the bullets of the enemy whizzed all around them. They returned the fire to the best of their ability, and succeeded in tumbling one Indian from his horse. That evening they arrived at Fort Benton, twenty days after leaving the Saskatchewan. Probably no men ever more thoroughly enjoyed the comfort of a warm log house and bright fire than they did that night. Their journey was one of the longest and most hazardous ever undertaken in the West in the winter time, and Raven Quiver's friend listened attentively to the story he told them before the blazing fire in the wide mud hearth.

After the American Fur Company sold out, the Indian trade was carried on by several firms in Fort Benton, and by a number of other traders who, getting outfits from these firms, would make short trips to the Indian camps, wherever they might be. The Indians eagerly exchanged their buffalo robes and furs for sugar, coffee, bright clothes, red paint, beads, firearms, ammunition and tobacco, paying enormous prices for them. Above all else, however, they prized the white man's liquor. At this time the trading of whisky was a dangerous business, for a United States marshal was anxious to catch anyone in the Indian country with liquor in his possession. He was authorized to confiscate the whole outfit of anyone so caught—teams, wagons, robes, liquor and all. From what was realized by the sale of all these, the Government retained only a small share, the officer getting all the rest, besides his salary and mileage.

In 1869 the international line between Canada and the western United States had not been surveyed, but near the Rockies the northern boundary of Montana, the 49th parallel was thought to be Milk River. Beyond that a trader was safe from the marshal. Reasoning thus, the firm of Healy and Hamilton, with a very large outfit of goods and liquors, went north in the summer of 1869 and built a bastioned fort at the junction of the St. Mary's and Belly rivers, a few miles above the place where the town of Lethbridge, Province of Alberta, now stands. In

their haste to cross the Indian country between Fort Benton and Canada and avoid an interview with the marshal, they had, in Western parlance, "whooped 'em up;" that is, they had urged on their teams with all possible dispatch, and hence they named their post Fort Whoop-up. It was fitly named, for they whooped things up there also, doing an immense trade that winter with the Blood, Blackfeet, and North Piegan Indians.

The following summer Raven Quiver determined to go into the trade himself, despite the fact that these northern Indians were related to the band Col. Baker had massacred, and so had no good will for the trader. He had a few hundred dollars, enough to purchase several wagons and teams, and his credit was good; he could obtain all the goods he wanted. The main thing was to get across the line without being caught by Charles Hard, the marshal, who was extremely vigilant. His headquarters were in Helena, but he had the habit of turning up at Fort Benton or Sun River crossing, a point midway between these two places, when least expected or wanted. The young trader easily found a few men to join him, all old time plainsmen, and ready for anything, from a squaw dance to a battle. One of these, Po-kah-ni-kap-i, or Child-old-man (I do not give the English names of these men for obvious reasons), was his full partner, the others employes.

The necessary outfit of provisions, trade goods and liquor were purchased at Fort Benton, loaded into the wagons, and everything made ready for an early start in the morning, when who should appear in town but Hard the marshal. Raven Quiver never lost sight of him from the time he struck town until he went to bed, and then he got the teams hitched up and the outfit pulled out for the north as fast as the heavy loads would permit, he alone remaining behind to keep an eye on the marshal. The wagons, after being loaded, had fortunately been drawn into a stable yard before the marshal arrived, and he had not seen them. Almost every man in the little frontier place was directly or indirectly interested in the Indian trade, and it was not likely that anyone would inform him of what was going on. For two days the trader remained at the fort, and the marshal loafed around, seemingly having nothing more important to do than to smoke his pipe. Satisfied that he had not learned that his outfit had pulled out, Raven Quiver mounted his horse just forty-eight hours behind them, and overtook the train the next evening when they were camped on the Marias River, eighty miles on the way to their destination; all was well.

The next night they camped at the foot of Rocky Spring Ridge, and on the following day, as they approached Milk River, something happened. Away back in the distance a dark object was seen rapidly coming on their trail. Raven Quiver was at once suspicious, and ordered his men to force the teams into a trot. Nearer came the object, and it was seen to be a team and light wagon, driven furiously by a single man. "The marshal!" cried the teamsters, and whipped their horses into a swinging lope; Milk River was still several miles away. Raven Quiver finally saw that the marshal would overtake them before they could reach it, so he and Po-kah-ni-kap-i, both mounted, dropped back to intercept him. There are few men who will not stop when coming face to face with a couple of rifles in determined hands. Hard was as brave a man as ever rode the plains, but he didn't attempt to pass those guns; instead, he tried to run a bluff.

"Well, boys," he said, "I've got you; been a hot chase; left the fort just two an' a half days ago, but I've caught you at last."

"It looks to me," said Raven Quiver, as if we had caught you. We've crossed the line and will not turn back. And if you make us any trouble, or attempt to arrest us, just understand at once that you've got to do a lot of shooting."

"What! Do you defy me? Me—a United States officer?"

"You're no officer here; this is Canada. If it isn't, just show us the line. That's where we've got you, Hard, and you may as well stop bluffing. If we can't prove that this particular place is in Canada, you can't prove that it isn't. If you arrested and took us back, our case would be thrown out of court, and you know it."

Hard gave in, but with no very good grace.

"Well," he said, surlily, "I'll turn back. You will be sneaking more whisky out this way, and I'll be on hand; I'll catch you yet." And without another word he turned around and took the back trail.

As soon as the teamsters saw that Hard had stopped, they eased up on their teams and drove on slowly. The whole outfit was in good spirits that night around the camp-fire; they had stood off the marshal, and there was no further trouble to be apprehended.

The traders chose a broad, open bottom on the north side of Belly River, several miles above its junction with the Kootenay, for their trading post, and in commemoration of their experience with the marshal, named it Fort Stand-off. It was built of large logs cut and hauled from the timber bordering the river, was mud-chinked, dirt-roofed, fire and bullet proof. It was a fairly good location, and a number of robes were traded for that winter. But it was found that they would have done better had they built further east, the Indians preferring to winter in the broader and more heavily timbered bottoms of the larger streams below. Their rivals at Fort Whoop-up had done a much greater business. Stand-off was abandoned in the spring, and after taking the result of their trade to Fort Benton, Raven Quiver and his partner returned north and built the fort which was named Fort Quiver. It stood at the junction of the Old Man's and Belly rivers, a few miles above Whoop-up.

Hard kept his word, and it was with great difficulty thereafter that the northern traders eluded his vigilance and escaped into Canada with their contraband cargoes. Once Raven Quiver was obliged to go to Helena for spirits, as none was to be had in Fort Benton. Hard was there and followed him about wherever he went. The trader spent some days trying to figure out a plan to elude his vigilance, but he finally hit upon one which succeeded admirably. Having purchased twenty cases of alcohol, a hundred gallons, he had the dealer quietly haul it to the banks of the Missouri, several miles below town. Hard wasn't watching the town teams; he kept an eye on the trader's wagon and horses at the feed stables. So long as they were in sight he felt easy. The alcohol safely carted to the river, Raven Quiver purchased a lot of trade goods,

enough to partly load his two wagons, and had his teamsters leave town with apparent secrecy late in the evening. Hard had been watching, and followed them. As soon as he also took the trail for the north, the trader went to the river, made a raft of his cases of alcohol, and, with a few provisions, pushed out into the current. Without much difficulty he arrived at the mouth of Sun River several days later, and cached the spirits, burying the cases in the sand. In the meantime Hard had followed the teams, and when they reached the Indian country he swooped down upon them one morning with a satisfied grin. But that soon changed to one of consternation and anger, for a careful search of the contents of the wagons revealed not even a flask of anything contraband.

"Where's Raven Quiver?" he demanded.

It was the teamsters' turn to grin. "I guess," said one of them, "he's back in Helena—t any rate we left him there."

The marshal saw at once that he had been led a wild goose chase, and back he went toward Helena, as fast as he could drive.

After he had been gone an hour or two, the men loaded all the trade goods into one wagon, and one of them drove the empty one to the mouth of Sun River, where he found Raven Quiver waiting for him. Three days later the outfit arrived safely in Canadian territory, and the laugh was again on the marshal.

Fort Quiver consisted of a series of log houses forming three sides of a square. There was a cook room, living rooms, trade and store rooms. The windows of these were high, so one could not look in through them from the ground. Broad fire-places of mud-plastered stone furnished the necessary heat. While the men were building it the Bloods and other Indians often appeared and fired a few shots at them at long range. But Raven Quiver had a .50 caliber Sharps rifle, and a few bullets from it plowing up the dirt near them always sent them away faster than they had come. When the fort was finished, however, skirmishing ceased, and the Indians came readily enough to trade, knowing that their furs and robes were wanted, and that they would not be harmed so long as they behaved themselves. It was an ideal place for a trading post. The broad, richly grassed plateaus lying between the St. Mary's, Belly, Kootenay and Old Man rivers were a favorite feeding ground for the buffalo, which swarmed over them in countless thousands, and there were three tribes of Indians—Blackfeet, Bloods, and North Piegiens—camped along the streams and slaughtering the animals. The women could not convert the hides into soft tanned robes so fast as their lords and masters could furnish them.

The trade room of the fort had a high, bullet-proof counter extending clear across it, so high that only the trader's head and shoulders were visible above it. Behind the counter were a few shelves, where tobacco, red and blue cloth, and various other articles were kept. Adjoining this room, and communicating with it by passageways cut in the partitions behind the counter, were, on the one side, a store room for the robes, on the other the room where liquor and various bulky goods were kept. All across both of these partitions were small loop holes, where, in case the Indians should get ugly, the traders could shoot through at them without any danger to themselves. When the room was thronged with them, several men were generally stationed behind these partitions, and the Indians knew it. They seldom made any disturbance inside, but sometimes a drunken crowd of them would shoot at the buildings under cover of the night, just for the fun of the thing.

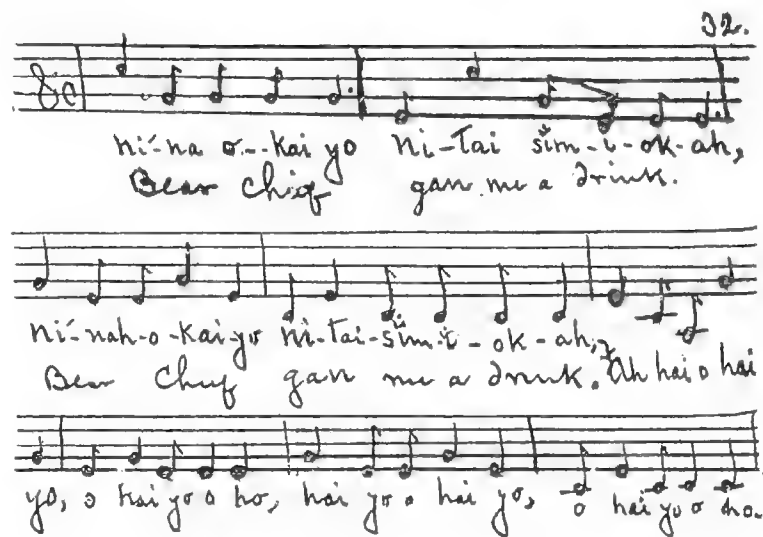

Although some whisky was used in the Indian trade, the greater part of the spirits sold was alcohol, properly diluted with water, the amount of the latter depending upon the condition of the purchaser. If he was sober, he got four parts of water to one of the spirits; if partly drunk the proportion was six to one, and if wholly drunk it was eight or ten to one. To the alcohol and water a small amount of burnt sugar and oil of bourbon was added to give it a whisky color and flavor. Really, it wasn't a bad drink—much better for the consumer, in fact, than cheap whisky. During the days of the northern trade, four good head and tail buffalo robes were the price of a four-to-one gallon, and the robes were worth about six dollars each. The value of one gallon of alcohol, which cost about \$6 was therefore twenty robes, worth \$120. There was some profit in the Indian trade!

The Indians were wont to come to the trading post at all times of the day and night; sometimes singly, more often in parties of from three or four up to fifty or more. Bottles were scarce and they were required to bring a keg or some receptacle for the liquors. Some times they staid at the post, or, if the weather permitted, built a fire in the nearby timber to have out their orgy. But more often they carried the liquor back to camp with them.

I would like to know why all uncivilized races, as soon as they get their first drink of liquor, acquire an insatiable desire for more, and will barter their most valued possessions, even their wives, for it. The Blackfoot word for drunk is *ah-wat-si*, which means crazy-brave. It is said that in the very earliest history of the trade, when the American Fur Company occasionally let the chiefs have a little liquor, they got merrily full and were more kind and docile than ever. My own observations are that liquor made the Indians, as their word aptly expresses it, crazy-brave; they fought with one another frequently, and it was generally a duel to the death. Yet I cannot say that they quarreled nearly as much or as seriously as so many white men would have done. One winter on the Missouri, when we had all of the Crees and Blackfeet of the north about us, there were only three deaths due to drunken fights. Some of the antics of the Indians when drunk were extremely ludicrous, and not infrequently pathetic. I once saw a brave, whom his wives were trying to catch in order to tie him, climb to the top of a lodge by means of a travoi resting against it, and heedlessly seat himself in the forks of the poles over the smoke holes, laughing and jeering at his pursuers. One of the women promptly threw an armful of dry grass upon the fire inside, and as the flame struck him—he had on nothing but a breech-clout—he gave a yell and leaped out, coming "catflop" to the ground. In an instant the women were upon him, securely bound his wrists and ankles, and carried him to his couch, where he soon dropped asleep.

Others again, when under the influence, became exceedingly depressed, and would cry for hours, mourning for

their dead. Like their white brothers, whisky made them sing; they had a number of "drinking songs," nearly all songs without words. Some of them, especially when sung by both men and women, were extremely expressive of various emotions of love, hate, recklessness and sorrow. I remember one which was a favorite with the women. It was a simple little thing, yet the expression and gestures with which they rendered it would have done credit to an actor. Here it is, as nearly as our musical notation can express it:

This, of course, was a drinking song, for the women also drank, but not to such a great extent as the men; and upon them liquor had the effect of making them extremely good natured.

It was inevitable that Fort Quiver should be the scene of several tragedies. Some Indians were killed in the trade room during quarrels among themselves, and Pokah-ni-kap-i, Raven Quiver's partner, had a narrow escape; an arrow intended for him killed an Indian beside whom he was standing. It was here that Calf Shirt, chief of the Bloods, met his fate. He was a man of powerful physique, very brave, and very brutal. Five or six men of his tribe had been killed by him for no cause whatever, except that it pleased him to murder them. He was greatly feared by all the tribes with whom he was at war, as well as by his own people. One day when Raven Quiver was in the trade room alone, he came in quite drunk and demanded some liquor, which was refused him unless he produced something to pay for it.

"I have nothing," said Calf Shirt, "but I am going to have some liquor, just the same, for I am the chief; yes, the chief of this country. I'll just kill you, young man, and take what I want."

Whereupon he whipped out an old powder and ball revolver and raised it to aim at the trader. Raven Quiver had been expecting some such move, and had picked up one of the loaded revolvers always kept behind the counter. Quicker than the chief, he raised his weapon and fired point blank at the Indian's bosom. The chief staggered slightly, lowering his weapon, and turning, walked slowly out of the room and started across the courtyard. Raven Quiver followed as far as the door and had another shot at him. In one of the living rooms the employes and several wolfers, who were visiting the fort, were playing a game of poker. As soon as the first shot was fired, they rushed outside, saw the chief leave the trade room revolver in hand, and promptly opened fire on him, too. Calf Shirt never looked at them, but kept walking slowly and steadily ahead, out through the courtyard and away from the fort. And the men of the fort kept shooting until they had emptied their revolvers, and then they looked at each other in surprise. Did the old fellow bear a charmed life, they wondered. About one hundred yards from the fort was a deep excavation where the earth had been taken with which to cover the roofs of the buildings. Calf Shirt had kept walking straight toward it, and at its brink stepped forward as if he did not see it. Down he tumbled, and the traders, cautiously approaching it, found him dead, the revolver still firmly gripped in his hand. There were sixteen bullet holes in his body, every one of them a fatal shot; he had evidently possessed the vitality of a grizzly bear.

The traders carried the body to the river and shoved it through a hole in the ice as the easiest way to get rid of it. Some Bloods, coming to the fort to trade, witnessed the closing scene, and expressed the greatest satisfaction over the death of their chief. None mourned for him except his wives. Calf Shirt had always told them that in case of his death, from any cause whatever, they should not bury him, for he would come to life on the fourth day after his demise. The day after he was shot his body was found cast up against a pile of driftwood, where there was an open place in the river caused by a large spring. His wives immediately carried it to the camp, and faithfully made medicine over it as he had told them to do for four days; they were surprised that he did not come to life again. They claimed that he did groan and move slightly once, and said that if they could have obtained possession of the body before it was cast into the river, they would surely have succeeded in reviving him.

Besides the traders of Forts Quiver and Whoop-up, there were quite a number of wolves and camp traders in the country. Coming and going all the time, with no buildings of any kind to shelter themselves from the attacks of the Indians with whom they traded, they led an exceedingly hazardous life. Their method of trading was to go into a camp, barter their liquor for what robes they could get in a short time, and then pull out before the Indians had time to get drunk and ugly. They finally formed an association, derisively called by outsiders the Spitzee Cavalry, and notified all the established traders in Montana and the north that they must not sell the Indians any more ammunition under penalty of being burned out. The reply of Henry Kennedy, a trader on Badger Creek, Montana, to the delegation which notified him of their intentions, was short and to the point: "I shall keep on selling ammunition," he said, "so just turn yourselves loose when you get ready. There are not many of us here, but we'll try to make things interesting for you while you're doing the burning."

They never attempted to carry out their threats; they had "put up a large bluff," but it didn't "go" with the class of men they had tried to work it on.

In the summer of 1873 the Canadian Crees stole some

horses from the Spitzee Cavalry, and the outfit followed them to the Cypress Hills, where they killed a large number of the Indians, men, women, and children. It was another Baker massacre on a small scale, and, as it proved, was also wholly unjustifiable, for the camp they attacked had not taken their horses. This affair, together with the large liquor traffic the Americans were carrying on, was reported to the Canadian Government by the Hudson Bay Company, with a demand for protection. The various tribes of the Blackfeet no longer traded at their posts; and they were losing a large amount of furs and buffalo robes, to which their charter entitled them. It will be remembered that they had a monopoly of the fur business in Canada. The following spring, 1874, the Government started a large force of mounted police westward from Winnipeg to stop all this lawlessness. They had no guides, no one knew the country, and it was by luck more than anything else that they struck the posts of the American traders on Belly River. They were out of provisions and all other supplies, and, although they had traveled through a country teeming with buffalo and other game, had no meat! A hunting party of Indians discovered their approach and warned some of the traders that a lot of red-coated men with cannon and wagons were coming. Raven Quiver and the Whoop-up traders cached their liquors, and, although the police searched their outfits, not a drop was to be found, to their great disappointment. But they were more fortunate further up the river, catching a trader named Weatherwax red handed. They confiscated his whole outfit, worth several thousand dollars, and fined him \$300 besides.

Thus ended the whisky trade in the north. It was a good thing for the Indians, for they were practically broken and demoralized. Nearly everything they possessed had gone for liquor—robes, furs and horses—and they were almost naked, and had scarcely enough energy left to go out and hunt for their daily meat.

From this time on, until the buffalo were finally exterminated, Raven Quiver traded in different parts of Montana, one year in one place, the next season somewhere else, wherever the buffalo and Indians were. He built posts on Badger and Dupuyer creeks, near the foot of the Rockies. In 1878 the buffalo left the Province of Alberta, Canada, and the plains adjacent to the Rockies in Montana, as far south as the Missouri, never to return, moving east and southward. The winter of '78-'79 Raven Quiver traded with the Piegiens at the foot of the Bear's Paw Mountains. In '79 and '80 he had a post on the Judith River, near its confluence with Warm Spring Creek, and did a good business there, though he traded no liquor that year. The buffalo were still working eastward, and the Piegiens who were camped near the post were obliged to go to Armells Creek and the foot of the Moccasin Mountains to hunt. In '79 and '80 Raven Quiver rebuilt Carrol, on the Missouri, two hundred miles below Fort Benton. The Blackfeet, Bloods and Crees were there from the north and he got from them 4,000 robes and 3,000 deer, antelope, elk and beaver skins. The succeeding season the trade fell to 2,400 robes. The next winter, '82-'83, although he had two trading posts, Carrol and another at the Round Butte further down the river, less than one hundred robes were taken in; the buffalo had been exterminated, almost the last remnants of the great herds being killed on the plains adjacent to the Musselshell River. A very few bulls and cows, perhaps fifty or sixty in all, escaped and for some years roamed in the almost impassable bad lands of the Missouri east of the Musselshell, but the French-Cree halfbreeds at last got them.

So ended the buffalo trade, a most exciting and profitable business. Of all the traders who succeeded the American Fur Company, Raven Quiver was undoubtedly the most successful, because he best understood the Indians and had the enviable gift of getting them to do what he wanted. In the fall of 1879, for instance, the Piegiens moved down on the Missouri, to winter near a trader at the mouth of the Judith. But Raven Quiver built a place seventy-five miles up the latter stream, and when he was ready rode down and induced them to move up to his place. In his time he handled about 50,000 robes, and nearly as many skins of the wolf, deer, elk, antelope and beaver.

J. W. SCHULTZ.

Natural History.

Birds by the River.

THE river bridge near my home extends considerably beyond the water, over low ground, to a hill running parallel with the stream. A long stairway takes one more directly from the bridge to the water's edge, and descending it I strolled down through the intervening flat. The river here dashes over a stony bed, nearing the end of a mile of rapids which required a portage in the early navigation. Large trees, more or less undermined, lean over the rushing current and invite the passer to seat himself on their roots and see the foaming water come down, first at the distant falls, then over the nearer dam and the slope below. Declining the invitation this time I kept the trail that marked the way to "the old swimmin' hole" and other attractions. Beside it spear-mint was sprouting freshly, and a nibble took me back to boyhood in no time, by the magic that sometimes lurks in tastes and smells. In a bush a yellow warbler was busily hunting insects among the leaves. This is not the "yellow bird" known to all who notice birds. The latter, however, better named goldfinch, I found not far off, shining in its spring suit of canary and masked with its jetty frontlet. When it has assumed the subdued tints of the colder seasons there is more excuse for confounding the two. The warbler seen at a little distance seems of an old gold color. Closer observation shows darker markings on the back and dull reddish streaks on the breast. Low trees and shrubs are its favorite haunts, and it is as likely to be found in town as on the farms. It flits restlessly among the boughs, repeating a quick, nervous little song.

Here on the flat also was the dolorous phoebe, contrasting with its yellow neighbor. This and some others of the flycatchers seem to the beginner in ornithology more discouragingly alike than even the sparrows. The wood pewee differs from the phoebe in having the lower mandi-

ble yellow instead of both black and the wing more distinctly barred with white. The least flycatcher is a trifle smaller and its bill is not black. Fortunately they have some other distinctions. The last named may be known by its repeatedly jerking out a couple of syllables that have been likened to "chebec," and this word is used as one name for the species. The bird throws the accent heavily upon the last syllable, and imparts a metallic clink to the utterance which is not rendered in the spelling. This flycatcher has no prejudice against human neighbors. I have found it building in a shade tree beside a park walk, in a fork of limbs, about twenty feet from the ground. The familiar kingbird, or tyrant flycatcher, likely to be found in any of these fields, is about twice as large, and is easily recognized when in flight by the white band displayed across the tip of the tail. The great crested flycatcher, of similar size, is a bird of the woods, and rather rare in this district. It utters a loud whistle, somewhat like a quail's, and when seen may be known by the pale yellow of its under parts.

At the foot of the rapids the river spread itself against the higher ground and forced the path up upon a little bluff, where it was separated from the water by a fringe of trees and saplings interlaced by vines which in summer cover all the bank with a luxuriant screen. Now the still surface of the river reflected the sky between the leafless streams. Cutting across lots in a curve of the river I came to a pasture conspicuous for a gravel knoll thirty or forty feet high; so regularly conical that it is easily fancied to be artificial. Standing in the bend it gave a fine outlook upon the river and miles of beautiful slopes putting on the fresh buff and green plaid of plowing time. Just below, crow-blackbirds and redwings were piping among some trees standing in a damp spot. In one of these trees were the abandoned diggings of a woodpecker, and a pair of white-bellied swallows had taken possession. One looked out of the porthole of the nest and the other mounted guard close by. These birds are easily identified—clear white below, black above, with a blue luster on head and neck. On a neighboring tree was another swallow, perching on a dead limb. To the average citizen the swallow is a swallow—the long-tailed bird that builds under barn eaves and gave a nickname to the dress coat. But that is the only long-tailed species; and the sooty swift, which the aforementioned citizen would inevitably call a swallow, in spite of the ornithologists, is about as nearly destitute of tail as any feathered creature. We are permitted to call it the chimney swallow on sufferance. The bird that I left clinging to the limb was recognized by the spot on its otherwise buff breast as the cliff swallow, one of the kind that used to build mud nests under the projecting shingles of the barns, this species finishing out its structure with a neck like a jug's, while the barn swallow was content with a more open cup. Where do these species live now? It is years since I have seen their mud houses sticking like parasites to man's larger buildings. Why did they lose such a characteristic habit of life?

And where do the thronging swifts roost and nest that swarm over the village in the evening twilight, "while glow the heavens with the last steps of day?" And what is this performance of theirs just above the tree tops, when they mingle in flight and trace their intersecting arcs on the rosy sky? Do they find insects specially plenty then and there, or is it all fun, a carnival of flight, a game of tag, a show of aerial gymnastics? Now one darts here and there, zigzagging like a bat, then sets its wings rigidly curving backward, and by its momentum cleaves the air in a symmetrical curve like the stroke of a scimeter. They keep it up as long as I can see them, but they must stop some time in the evening, and then where do they stow themselves? The village cannot offer unused chimneys enough for them. They have been known to crowd into hollow trees, and perhaps these find some such shelter. But where are their nests? They do not build exclusively in chimneys. I found one in a barn—a slight bracket of coarse bits of hay, fastened together and to the boarding with the glue which the bird secretes.

I begin to doubt whether I know the regular dwelling places of either kind, but the bank swallows, which I can see any day in their season plunging into little burrows in the face of a sand pit. Their distinguishing mark is a band of color across the white breast. Bank and hand are words near enough alike to keep this mark in mind in connection with this species. About the same sand bank I have seen a kingfisher hovering, and perching here and there on neighboring trees, although the place is something like a half mile from any fishing water. I could not find that it had a nest here, but it makes one like the bank swallow's, only larger. With other boys I once took the young kingfishers from such a burrow, to which our parents ordered us to restore them. These big, showy blue and white birds, with their harsh, clattering call and their appetite for game fish, hardly deserve our tenderest regards.

Reaching the water's edge at a point where I had caught fish myself in other days, it seemed like neglecting an opportunity to turn away without fishing; so I baited hook, threw out line and seated myself comfortably on the grass. He who called fishing the contemplative man's recreation must have had this style in mind; certainly not the soul-absorbing practice of fly-casting or the busy employment of dredging weeds with a trolling spoon. Nothing occurred to interrupt my enjoyment of the beautiful scene. A bush could do this sort of fishing as well as a man. Tying the line to a twig, I strolled along the beach, and was lucky enough to set eyes on an animal that I had read of as the mud puppy, but had never happened to find. Swimming languidly near the shore was a lizard-like creature, eight or nine inches long, dark brown, with darker spots. It settled stupidly among the stones so near the edge that I whisked it out upon the ground with a stick for a closer look. It showed an injury that perhaps accounted for its lethargy, though I should not expect it to be a very lively animal at the best.

This was the end of the trip. On the way back I had a good chance to observe a species of wader that had attracted my attention before, but kept themselves too far away, always seeing me first and flying off low over the water with a cry like "weet, weet, weet!" consisting of a whistled syllable repeated several times at the rate of two or three times per second. It was easy to guess they were sandpipers, but I wanted to deter-

mine their species. A low island lay about a gunshot out from the bank, and some of these birds were exploring its margin after the manner of their kind, occasionally flying from point to point and piping their shrill calls. My chance came when two or three crossed to a muddy bit of an islet very near the main shore. Remaining motionless, I watched them through my glass with great interest. They showed a dark color above and white below. While they went peering about in the mud or shallow water, among the stones and weeds, poking their long bills into any likely foraging spot, they kept up a teetering motion, as if their bodies were unstably balanced on their slim stilt-like legs. They seemed to be birds of neat and gentle manners, happy in each others company, and made a very pleasing impression. One of them, standing in an inch or two of water beside a boulder, where a tiny cataract poured round from the other side, made a picture such as Audubon liked to draw. Their darker color matched their surroundings so that they were easily lost to sight, except when standing so as to show the white lower parts. When they faced toward me I could just see the round, dark spots that cluster so thickly on the breast as to blend at a little distance, and then I knew them to be the spotted sandpiper. Thinking of them as spending their life at the water level, or but a few inches above it, and feeding on aquatic creatures, I was rather surprised later to see one a little further up stream posing in a different character, standing on a flat-topped fence post, back from the water, catching insects that could be seen flying thickly and throwing themselves into his mouth with a readiness and frequency that ought to have been satisfactory. Soon, however, like many another grasping biped, he toppled himself off his base by clutching too eagerly. He fluttered to another post, and though it was but two or three fence lengths away, did not forget to sound the "weet, weet, weet!" which they utter on taking flight. Next this bird settled in the field, as did another that I saw; but they seemed less at home than a pair that sprang from the water's edge just after, and flew out till their white feathers were lost among the tossing foam crests of the rapids.

BRISTOL HILL.

Man and the Brute.

In discussing animal intelligence I fear your contributors do not all go back to first principles. They do not recognize the relationship which exists between men and animals according to the divine plan of creation: any more, perhaps, than many recognize or admit the relationship which obtains between themselves and their Maker.

The basis of all is love, trust, confidence.

The more we cultivate the acquaintance of animals the more their brute instinct seems to expand into a reasoning faculty. They at least learn to deliberate before they act, and to study causes and consequences. They read the purport of the eye, and are quick to discern the meaning of signs and sounds, and articulate words, often evincing a capacity equal to human. All animals have a limited vocabulary of their own. Men and animals by intercourse learn each other's language. If the brutes are silent it does not follow that they do not understand. Words, or the number used, are not the measure of intelligence, brute or human. There are other media of expression or perception. Deficiency in parts of speech is compensated by the possession of occult faculties which biologists endeavor in vain to explain. So it is not within the scope of man to declare the limit of animal intelligence.

Few farmers attempt to make the acquaintance of their live stock: any more than the slave driver makes the acquaintance of his human serfs. If these inferior beings have any brains or sensibilities above their daily tasks, they never have opportunity or encouragement to display them. Their masters never draw them out, and the unfortunates are afraid to utter. Some farmers never speak softly to their live stock, never caress them, never catch a reciprocal glance of the eye, never open their mouths to them except in curses or commands! The cattle of such men are wild; the horses are vicious, the cows don't give down their milk; the cats flee in terror, and the hens flinch when the feed is thrown to them. This is because of man's delegated sovereignty. Fear and an innate sense of inferiority smother their intellect and its manifestations.

Whenever we happen upon an intelligent dog or an intelligent dog with a cheerful mien, we will discover that he has a kind master. We will discover that he not only has the habit of caressing and talking kindly to him, but as he gets more and better acquainted, of expressing his passing thoughts aloud, of asking advice, and imparting his confidence, just, for example, as a negro talks to a mule. That is better than muttering to one's self, as many are apt to do. And in course of time the animal actually learns the purport of many words, and is eager to respond. "Cap!" I heard his mistress say to the terrier under the table, "take that bone out into the yard." This order, given without manual sign or inflection of voice. "Cap! go up stairs and lie down!" "Cap! get up into that chair and stay there until I tell you to get down!" And that dog can hardly be made to get down until he receives the mistress' order.

Surely crude instinct plays a very insignificant part in this little melodrama!

Observe how much pains animal trainers take to ingratiate themselves into the good will of their pupils! Not to startle them by coming on them unawares, as the dunce of a boy does to his big sister; or to speak harshly to them unless they err; always to win them by love and a lump of sugar!

Now, love is the basis of all intercourse between men and animals, men and their neighbors, and men and their Maker. Show me a man who is kind to animals and I will show you a good neighbor. Show me a man who treats his neighbor as he would like to be treated, and I will show you a follower of the divine Master.

One trait about animals is that they seem incapable of more than one idea at a time. No animal could emulate Paul Morphy, who played twenty games of chess simultaneously. Fear is dominant as a means of self-preservation. This makes them wild. In order to tame them we

must remove fear and beget trust. With fear absent, intelligence unfolds and faculties develop. The closer a man's relations are to his Maker, the more intelligence he can discover in the brutes; and the attitude of brutes to man is analogous with man's attitude to the Creator. The man or beast who is self-contained and oblique will never rise above the lower level himself, nor see anything good or brilliant in the creatures around or above him. Life is a blank, and the future opaque. If a man is to hold dominion over the beasts of the field, they must at least have sense enough to be dominated.

In a former treatise on the "Super-sense of Animals," which was printed in the FOREST AND STREAM some twenty years ago, I referred to the homing instinct which is inherent in many animals, especially dogs, cats, bees, and pigeons, and has always been a puzzle to psychologists. And has not man often had to depend on this super-sense of his dog or horse to extricate him out of a dilemma when he has lost his way, or been enveloped by darkness, or hemmed in by fire, flood, or blizzard? "Thou, O Lord, shalt save both man and beast" is the divine apostrophe (Ps. 36:7). Does not this forecast contain an implication that men and animals are nearly enough on the same intellectual plane to be included in the same category and involved in the same ultimate fate? That there is an innate intelligence in the animals which will make them as fit companions for man in the "new earth" as they are in the one existent? CHARLES HALLOCK.

Mammals of Mt. Katahdin, Me.

BY B. H. DUTCHER.

From the Proceedings of the Biological Society of Washington.

In the summer of 1902 I spent from July 10 to September 5 in an attempt to determine the mammalian fauna, and in general the faunal zones of Mt. Katahdin in north central Maine. This mountain was chosen because, as far as I know, no mammal work had ever been done in its vicinity, and because of its height and isolated position.

The old idea of Katahdin, printed even in geographies, was that of an extinct volcano, an assumption very excusable in those whose views of the mountain were from a distance, for the "basins" or heads of the old glacial valleys on the eastern side, with their wide encircling walls on the north and south, give the appearance of a great crater blown out on one side. A closer examination reveals the fact that the mountain is in reality a granite ridge of very irregular outline with its major axis lying north and south, flanked by precipitous buttresses, the glacial retaining walls, that project out to the east, west, and north, and drop rapidly away in slopes of high degree on face and point. On the east, north, and west are a number of smaller ridges, timber-covered, nestling under the shelter of the greater mountain, and separated from it by valleys and basins. These minor ridges, Hunter Mountain, Traveler Mountain and the Four Brothers, vary from about 2,000 feet to 3,000 feet in height. Katahdin itself reaches 5,200 feet.

The rainfall is so great on the mountain top that its entire surface is moist at all times, and there are at least four perennial seepage springs on the tableland. Two of these are in the fir scrub, which has been cleared for a short distance around them by the gathering of animals to drink in times gone by. The water does not flow out on the surface, but is found subterraneously in little depressions among moss-covered rocks.

Trapping was done at various localities from the base camp, at the union of the Wissataquoick and East Branch Penobscot rivers, at 450 feet, to the tableland, at 4,500 feet. The following thirty-six species of mammals are recorded from Mt. Katahdin.

WOODLAND CARIBOU.—The caribou is an animal of the past in the Katahdin region. To-day all that remains is its bones in the porcupine dens. From accounts received, there have been two migrations of caribou from northern Maine within the memory of inhabitants now living. The last of these occurred about six years ago.

Unfortunately the awakening of public sentiment in regard to the importance of game preservation did not take place while the animals were still abundant, and their absence now can in part at least be attributed to wanton destruction.

MOOSE.—The recent protective legislation has, in the opinion of the natives, resulted in allowing a very considerable increase in the numbers of moose. Judging by the sign observed, they are comparatively abundant on the base of and near the mountain. They range up to timber line in favorable localities. Man is practically the moose's sole destructor, and if the killing in defiance of law that takes place to feed the lumber camps were prevented, there would be a still greater increase. It is very difficult to secure evidence against these malefactors. The lumber camps are so isolated that all the persons in them, and in their vicinity, are to a certain extent beneficiaries directly or indirectly, from the fresh meat secured, and are hence *particeps criminis*. The danger of detection in a camp of sixty men, where one animal can be entirely consumed in a short time, is very small, and evidence is not easily obtained.

NORTHERN VIRGINIA DEER.—Deer are really abundant in the Katahdin region. It was not unusual to see as many as five in the course of an afternoon's walk. They sometimes prove a nuisance by destroying unfenced gardens. One was seen near Chimney Pond, at an altitude of about 3,000 feet. They are not common at this altitude, however. In spite of the illegal hunting that takes place they appear to be on the increase.

SOUTHEASTERN RED SQUIRREL.—Red squirrels are abundant throughout the region, extending even to the treeless tableland of the mountain, where I saw one at close range August 28. Another was seen by one of our cooks in the same locality. At Chimney Pond camp, altitude 3,000 feet, they were abundant.

NORTHEASTERN CHIPMUNK.—Chipmunks were common on the hardwood ridges of the low ground, but I saw none at the higher elevations where the deciduous trees were not so abundant.

One specimen taken at 500 feet altitude is typical *lysteri*.

WOODCHUCK.—Fairly common on the lowlands.

CANADIAN FLYING SQUIRREL.—A living specimen was kept in the lower camp. These squirrels are common on

the hard wood ridges. As usual, however, unless trapping for fur, one does not secure them.

BEAVER.—The beaver is now protected during all seasons in Maine. I heard of a few colonies, on rather poor authority, but the animal no doubt exists in secluded localities.

MICE.—House mouse, common in dwellings. Canadian white-footed mouse. Cooper lemming mouse. Preble lemming mouse. Meadow mouse. Redbacked mouse. Meadow jumping mouse. Woodland jumping mouse.

MUSKRAT.—Exceedingly abundant. While canoeing one day I paddled up within a few feet of one asleep at the water's edge. While we were watching him he half opened his eyes, apparently looking directly at me, and leaning down lapped the water at his feet, then closed his eyes and relapsed into slumber. If his eyes had seen, his cerebrum had not interpreted, and he did not recognize his dangerous position. A slight noise sent him to the bottom like a flash.

CANADA PORCUPINE.—Very common from the river to the summit of Katahdin. Their dens in the fir scrub and rock heaps were filled with caribou bones that were deeply chiseled by their incisors.

SOUTHERN VARYING HARE.—The varying hare occurs on the tableland, where I trapped one in an old caribou trail in July.

CANADA LYNX.—Rather a common animal, if the accounts of guides are correct.

RED FOX.—Quite common throughout the lower parts of the region, where they are often seen on roads.

OTTER.—Quite common along the lower streams and ponds where fish abound.

WOLVERINE.—The trappers all denied having seen or heard of the wolverine in the region, though they were acquainted with the animal by repute.

FISHER.—From the accounts of our cooks the fisher is one of the commonest and most valuable of their furbearing catch.

The Deer's Scent.

NILWOOD, Ill.—*Editor Forest and Stream:* In June 6 issue I note Mr. Carney's experience with antelope and his impression as to their power of scent. I have never hunted antelope, but have put in a few days each fall since 1890 hunting deer and moose, and have often wondered if the power of scent in these two kinds of wild animals was so well developed and so much depended on as was supposed.

Several times have I killed deer and moose while going with the wind, and each time the conviction that they do not always scent a man, and understand that danger follows the scent, was more deeply impressed on my mind.

My brother hunted with me on several occasions, and he noticed the same thing, and one day, when we were ready to start and finding the wind in the wrong direction for us to hunt the place we had intended, he remarked, "It does not make any difference, they don't scent a fellow so easy as some people think."

We got one deer that morning, a large buck standing and directly in the path our scent should have taken if the wind blew straight. The fact that he was standing still and not over 100 yards away, shows that he either did not scent us or did not know what the scent stood for. The same thing happened last fall. In company with a friend I was hunting with the wind and got a yearling doe.

My friend remarked that morning, just before we started, that he thought it did not make any difference which way we went, with or against the wind, and the result proves he was correct on that occasion. One morning, in the summer of '94, two moose bulls came within two rods of my shanty. I was on the porch in front, and with me was a young spaniel pup, both of us in plain sight, and from the first appearance of the moose the pup kept up a constant barking, which did not in the least worry the moose. They spent at least 15 minutes nosing round in the open, then walked away. My camera was just inside the door, and if it had been just outside I would have been able to have reached it and thus been able to give you a picture of those fine fellows to prove my statement.

J. P. B.

Illinois Game and Song Birds.

A CORRESPONDENT known as "Farmer S," writes about matters and things in his part of the world, which is at Dixon, just west of Chicago, in what was originally one of the best upland shooting countries of this State.

"I have four Hutchins, three snow, and two laughing or speckled belly geese. What I want to know is, will they breed in captivity? Will some one rise up and give his experience?"

"My geese have a blue grass pasture of one and a half acres. They tame easier and sooner than ducks. I have tamed a number of species of ducks, but a pair of pintails were so wild I finally mounted them and put them in my case of ducks.

"One mallard hen that my wife winged we kept seven years until it got killed by the cattle.

"I saw an account of a great northern shrike in some Eastern city making the sparrows go into hiding until some misguided person shot it. That was the wrong thing to do. The shrike kills a great many sparrows. It is quite destructive to small birds, but nature seems to keep a pretty good balance when let alone. To import English sparrows is 'dead agin nater.'

"One of the most valuable birds to the farmer is now extinct in this part of the country; one or two pairs put in their appearance each season, build a nest that is promptly taken by the sparrow. Where a few years ago over a herd of cattle you saw hundreds of the common barn swallow, now you see none. Flies have increased accordingly, and it means the loss of flesh to cattle that have to fight flies all day and feed at night. Few farmers realize what this big loss means. The sparrow can be poisoned or shot in winter, but for every one man that would get rid of the pest there are fifty who will do nothing.

"The bluebirds are in very small numbers, but I do not know whether the sparrow is to blame for that or not. They surely have possession of the bluebird and martin

boxes before they come in the spring; but I have seen more bluebirds this spring than I did last year.

"The heavy rains of late will be bad for the first hatch of chickens, and I do not see how the early nests can escape the crows before the grass grows up to hide the nests. There are fifty crows to one that was here twenty-five years ago.

"The striped gopher went missing, or most of him did. Some think they were drowned out last season. I'm afraid my staying home from meeting last season accounts for four hundred of them."

E. HOUGH.

Squirrels for City Parks.

BUFFALO, N. Y.—*Editor Forest and Stream:* W. P. Davidson inquires as to the best variety of squirrels to use in stocking city parks. I lived in Madison, Wisconsin, several years ago and the capitol grounds there have been stocked with gray squirrels. The ground keepers scatter nuts around the grounds regularly, besides visitors take pleasure in feeding them, and many squirrels will take nuts from strangers' hands, and seem to be perfectly tame and fearless. The squirrels show no disposition to leave, but as they have increased from year to year they are now plentiful throughout the city. No one harms them and dogs are not allowed to bark at or chase them. Small houses have been placed in various trees in the capitol grounds for their homes. I think that if the squirrels were tamed before liberated, and provided with food and small houses built for them it would be an easy matter to stock a park, and in time, with the exception of winter, would require but little feeding. The visitors and neighbors will do that.

DIXMONT.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in **FOREST AND STREAM.**

His First Deer.

It was an afternoon late in July. The little pond nestling in the heart of the Adirondack hills glistened under the rays of the mid-summer sun like a gem "of purest ray serene," a sparkling jewel of wondrous beauty. From its unbroken shores the forest rose, spreading from hill to hill in billows of living green, until it seemed to reach to heaven itself. This was indeed the "forest primeval," for as yet the lumberman in his search for riches had not found his way to it, and the "murmuring pines and the hemlocks" were as yet untouched and unscarred by his devastating ax. The surface of the pond was as smooth as a mirror except as some trout rose after an elusive miller, more in sport than from hunger, for the afternoon breeze was so faint it did not cause even the faintest ripple to disturb its glassy depths. There was not a sound beyond beyond the song of a robin in a nearby tree, or the lazy croak of a frog in his marshy home, to break the peaceful stillness of this secluded spot. The very air seemed full of that peace such as one finds only when close to the heart of nature. Away beyond yonder mountain tops there was a world of strife and discord, of evil and sin, but here in the midst of the mighty forest, under the shadow of the eternal hills, there was something akin to that "peace which passeth understanding, which fadeth not away."

There was no sign about this quiet spot of the presence of man, for the little pond lay off the beaten trails frequented by the sportsmen, and was seldom visited by those in search of health or game. None but the denizens of the wood, nature's humbler children, lived here, and seldom had the crack of rifle or click of reel caused them to know fear or pain, or disturb the peace and quiet of their haunts.

On this particular afternoon the place seemed unusually quiet and still, and there was no suspicion of the presence of aught to disturb the peaceful scene, when suddenly there appeared on the shore of the pond two persons, a man and a boy.

The man was tall and straight as an arrow. His swarthy skin, his piercing eye, his manner, his every movement betokened one in whose veins ran the blood of the stealthy, crafty Indian. A long line of savage ancestry, chiefs of the St. Francis tribe, had left its mark upon him, giving him a grace and dignity of expression, while the blood of the white woman who had borne him, coming as it did from the strong race of the Dutch, had given him nobility of character and of mind. He was a fit subject for a painter's skill as he stood there, his keen eyes alert to catch every movement about the pond.

The boy was but a little lad. His fair skin and light hair showed plainly he was of different origin from the man beside him. The seal and stamp of the city had been set upon him, just as the Huguenot blood that ran in his veins marked him from the man of savage lineage. He was but twelve years old, but by his manner showed he had at that early age learned something of woodcraft, for he unconsciously imitated the cautious, stealthy manner of the older hunter. Hugged close to his breast he held a rifle, while in his belt he had a hunting knife, suspiciously new.

The two stood for some moments carefully scanning the shores of the pond in search of any deer that might be feeding upon the lilies growing upon the marshes. Having satisfied himself there was no game in sight, the man drew from the bushes where he had concealed it a light cedar skiff, and pushing it into the water bade the boy get in it. With careful tread the latter crept to the bow of the boat and sat down with his rifle across his knees. In a moment the boat was afloat and the man, with a few strokes sent it flying out into the middle of the pond.

For some time the boat was allowed to drift while the two hunters listened for the slightest sound which should warn them of the approach of the game they were seeking.

As they listened, the boy thought of the camp across the long trail, and of the mother who had kissed him good-by and told him to "bring home a big buck." The

others in the camp had rather laughed at the little hunter as he set out, as if it were a joke for such a "kid" to expect to kill his first deer, for some of the older ones knew what it meant to have "buck fever" and to get rattled at the sight of one. He had felt very proud to be sent off all alone with "Isaac," his father's guide, to get meat for camp, and he meant to show them that he was entitled to a place among the hunters of the camp. And now as he sat there listening with eagerness for the sound of a deer's step, though his heart seemed to beat so hard he was afraid "Isaac" would hear it, he felt very brave and cool, and felt certain he was going to shoot straight and true if he had the chance.

Suddenly the stillness was broken by the sound of a stick being broken on the side of a hill just across the pond from the boat. The man shook the boat and the boy nodded his head to show he understood what it meant. Similar sounds showed the approach of a deer, for such it was, until finally there stepped out from the bushes upon the marsh a fine buck. For a moment, "like crested leader, proud and high" he "tossed his beamed frontlet to the sky" and gazed out across the water at the strange object floating there, then stepping out bent his head and began to drink. As soon as his head went down the man swung the boat toward the shore, and began to paddle with noiseless skill, bringing it with every stroke nearer to the unsuspecting deer. The latter raised his head and again looked long and hard at this unfamiliar sight, but as he did so, the man stopped every movement, his raised arm seemingly turned into stone. The boy sat motionless, his eyes fixed upon the game in front of him, his fingers tightly gripping the rifle upon his knee.

Again the deer dropped his head and began to eat the yellow lily buds, seemingly satisfied there was no reason to fear the strange object on the water. As he did so the man stopped the boat, which by this time was quite near the shore, at the same time shaking it to warn the boy to get ready to shoot. In response came the click of the hammer as the trembling fingers of the boy drew it back. At the sound the deer threw his head up and began to walk toward the bank, his suspicions apparently aroused by the faint noise from the boat.

"Shoot," the man whispered.

Slowly and carefully the boy drew the rifle to his shoulder, and after taking steady aim fired. As the sharp crack of the gun broke the stillness the buck sprang into the air and went plunging into the brush. For a few moments there was the sound of breaking twigs, and then all was still again.

"You've got him," the man said, for his quick eye had noticed the dropping of the deer's tail, a sure sign he was hit. He pushed the boat in to the shore and the boy, all eagerness, sprang out and ran into the woods. The man following him found him standing beside the dead buck, a grand one with five prongs on each horn. Patting the youngster on the shoulder, he complimented him on his good work. The boy's eyes glistened at the words of praise from one who was known to be one of the best hunters among the guides of that region, and he was filled with exultant pride as he gazed at the noble prize that had fallen before his sure aim. Now, indeed, he could prove to those who had laughed at him in the camp that he was entitled to a place among the hunters, for he had shown his ability at the very first time he was tested.

Soon the man had dressed the deer, and it was ready to be carried to the camp. Pushed by the strong arm of the man, the little boat was soon flying across the pond, and in a few moments the hunters were at the end of the carry leading to the distant camp. Hiding the boat again in the brush, the man picked up the deer, and, followed by the boy, was soon lost to sight in the shadows of the forest.

As they are lost to view, peace seems to settle once more upon the little pond, and there is naught to mar the calm stillness which they had so rudely broken. The setting sun sheds a soft glow upon the surrounding hills and glistening water, while the pines sing their evening hymn in response to a gentle breeze that faintly stirs their stately tops. The robin sleeps in his leafy home in yonder tree, and the lazy frog sits silent on the marsh, while the trout has sought the seclusion of some deep pool. A timid doe and her fawn feed quietly upon the shore, undisturbed and unalarmed. There is no trace of the tragedy of an hour ago as the shadows of the evening fall, and softly now the light of day fades away into the calm and peace of the quiet night.

Many years have come and gone since that July day. The boy has grown to man's estate and many deer have fallen before his aim. He has learned to love the woods, as one must do who has spent any days in the "Adirondack Wilderness." To the man whose nerves are jaded by the rush and whirl of city life, who is wearied from the strife and struggle of business, sick at heart or ill in body, there is nothing so refreshing, so restful, so healthful for mind and body as a sojourn in camp or cabin in the forest. Close to the great heart of nature, away from the sordid things of the great world of strife for gain and pleasure, in the fresh sweet air, the simple life of the woods, there is healing for all "those ills which flesh is heir to." On the sparkling waters of the little pond, under the shadow of the eternal hills, or by the crackling fire in that good fellowship such as one finds only in camp, in sunny day or starry night, the aching heart, the wearied nerve, the tired body will each find rest and peace.

What pleasures can we find to compare with the simple pleasures of the woods? Who would not exchange a dozen nights amid the electric lights of Broadway for one star-lit night in camp, or the gayest party of "the season" for a quiet hour by the camp-fire with one or two congenial souls? Can any of Mr. Grau's singers make music half so sweet as the click of a reel or the crack of a gun, or did any orchestra ever play symphonies to compare with those played by the wind upon the pines?

Surely the man who has once tasted the joys of a life in the woods can never forget them, and never cease to enjoy them.

So to the man who was a boy that July day there will ever come knocking at memory's door the thought of that great day when he stood in boyish pride beside his first deer.

MORRIS JESUP DURYEA.

Game Preserves and Adirondack Ruin.

Editor *Forest and Stream*:

In the beginning God created the heavens and the earth, and the waters on the face of the earth, and commanded that the earth bring forth grass, and herb, and fruit-bearing tree, and fowl that may fly above the earth, and beast of the earth, and that the waters bring forth abundantly of life. And he saw that all which he had created was good. Lastly he created man, and gave to man dominion over all the other things which he had created. The word "dominion," as here used, clearly means control, use and enjoyment. He gave this dominion to "man," not to a man, or to a class of men, neither did he give to any man or to any class of men the right to deprive other men of this dominion.

Man is naturally the most selfish of animals. Most animals are satisfied with enough to make them comfortable and happy, but man is never satisfied. Ever since Adam gave the first exhibition of human greed in the garden of Eden man has sought to get more than that which is justly his own, and to aid him in satisfying his greed he has set up false standards of right and wrong which he has named law. I cannot believe that this is in accordance with the divine will. I cannot believe that it is the divine will that the wealthy class shall corner all the good things of this life for its own benefit regardless of the rights and well-being of the poorer classes. Christ did not tell the rich young man to buy a game preserve and exclude the poor from it. On the contrary, he told this young man that if he wished to do right to sell his goods and give the proceeds of the sale to the poor, which is a radically different way of using wealth and treating the poor.

The almost irresistible temptation of the wealthy to use their wealth for the gratification of their own selfish desires regardless of the rights of others, and the wrongfulness of this use of wealth, is no doubt what prompted our Savior to say, "It is hard for a rich man to enter into the kingdom of heaven." And then to define just how hard it is for the rich to resist this temptation he added, "It is easier for a camel to go through the eye of a needle than it is for a rich man to enter into the kingdom of God."

Now I believe our Creator ordered everything for the greatest happiness of mankind. I believe the divine law is better than our human law, and that if we try to enforce a human law that antagonizes the divine law it will sooner or later get us into serious trouble. It is not my intention to preach a sermon, but I do wish to call attention to a few fundamental truths which some people seem to have lost sight of in their desire to prove that the rich can do no wrong.

Selfishness begets selfishness, and hate begets hate just as surely as good-will begets good-will, and love begets love.

We should not sow the wind if we do not wish to reap the whirlwind, and it is the people of wealth who should heed these maxims most, as they have the most at stake as well as the greatest power at their command for good or evil.

The history of a little lake, which I have in mind, shows how the good gifts of God may be converted into a curse by the selfishness of man. This lake lies embosomed among hills and mirrors in its clear depths both forest crowned mountain and pleasant groves.

During my childhood and early manhood it served as a playground for the inhabitants of the surrounding country. Its waters furnished sport for those who delight in fishing, and the fish taken from it were usually made into chowders. The leafy arcades of the groves on its shores furnished the dining halls in which these chowders were eaten, and also furnished arenas in which games and sports of many kinds were enjoyed. Here the young and the old, the rich and the poor, met on a common level, and were taught in this school of friendship and brotherly love to know each other better, to become better men and women, and better citizens of their country. The lake was an educator for good, and who shall say that in thus furnishing an opportunity for relaxation and enjoyment to several hundred people, it was not fulfilling the destiny for which it was created.

About a score of years ago a person with money and inclination to put an end to this happy state of affairs, came, saw, and "lawfully" appropriated the little lake for his own use, and thereby converted it into a teacher of envy and hate. Now this is dangerous teaching. It is of the sort that develops the highwayman, the anarchist, the firebug and other types of criminals. It is of the sort that caused the guillotine to drip with blood during the Reign of Terror in France. We can only hope that the seed this person is sowing will be killed by good influences before it shall produce its terrible crop. Or better still, that it may fall on uncongenial soil, where it will never germinate. Indeed this is a subject on which every good citizen has abundant reason to "feel strongly."

I have been a frequent visitor to the Adirondacks, and have witnessed the arrogance of the preserve owners, and heard the mutterings of the gathering storm of wrath which has culminated in fire and destruction. Great and deplorable as is the ruin which has been wrought, I fear that even greater will be witnessed in the future if a better understanding and a better feeling cannot be cultivated between those whose interests are involved.

The "Mailed Hand" is powerless in this case. As well might one try to crupper the whirlwind as to try to prevent the work of the fire fiend in this vast domain with police or military power.

I believe the best remedy for this deplorable condition of affairs is a compliance with the divine law, "Give to the poor." I believe that a compliance with this law would be a sovereign remedy for most of the troubles and evils of this life.

If those who are rich in money, rich in knowledge, rich in opportunities for enjoyment, rich in friendship and good-will, rich in anything which has power to elevate and make better, would give freely of their riches to the poor, i. e., those who lack such riches, I

believe that even the detested firebug, who, it must be admitted, is one of the poorest creatures that curse this earth, would be transformed into a good citizen.

When the poor of the earth had been made rich with these good gifts they in turn would become givers, then would this earth become a heaven of happiness, and the givers would receive their reward.

JOS. W. SHURTER.

CANSEVOORT, July 10.

Maine Association.

BANGOR, Me., July 11.—*Editor Forest and Stream*: The week just ending has been an interesting one for Maine sportsmen in many ways, since this was the date of the annual mid-summer outing of the Maine Sportsmen's Fish and Game Association at Kineo, when piscatorial interests and politics get well mixed, and the policy of the Association in the way of future legislation begins to assert itself, or those in charge endeavor to mold it as they think best. There was a big gathering at Kineo, some going the Fourth and remaining until Monday next, the large number doing this being a constant proof of the beauties of Moosehead, which can draw and hold so many people for as long as they can spare. The outing proper lasted Monday, Tuesday and Wednesday, and during that time there were public meetings, informal discussions on the broad veranda and in the office, contests on water and land by the guides, fishing contests by the members, and excursions to points of interest about the great lake.

The central feature of the outing was the public meeting of Monday evening, when the gathering discussed, through speakers called upon by the chair, the advisability of prohibiting the killing entirely of doe deer and fawns, or the limiting of the number of does to be killed by one person, and the forbidding entirely of the carrying of firearms into the woods in close season. President C. A. Judkins, of Kineo, presided, and there were several speakers, several of them sportsmen, and still several others owners of wild lands, the general opinion being that it would be impossible to secure the passage of either proposition in the Maine Legislature at this time, although the speakers were about evenly divided as to the advisability of either measure. It was admitted by several of the speakers that there is a great number of deer in Maine at the present time, in fact, almost more than the natural conditions will support, and that, aside from sentiment, there is no good reason for protecting does more than bucks at present.

Two of the most influential speakers came out flatly against the proposition to prohibit the carrying of firearms into the woods in close season, one speaker urging that in his opinion it abridged unlawfully the right of every citizen to bear arms, while the other suggested that, having gone to the limit in the enactment of last winter's law licensing non-resident hunters, it was now a good time to stop and wait for developments and see how the present laws work before continuing an agitation that could but create a feeling of unrest and insecurity upon the part of the thousands of visitors who come to Maine to spend their money. The representative of the guides also objected strongly to the propositions, and saw no need for either, although admitting that the guides are not perfect, but on the whole willing to see the spirit of the present laws upheld, if not more restrictions are imposed. "The passage of the license law last winter was bad enough," said he, "it seems to us like rubbing it in pretty hard to attempt to saddle the game laws with more innovations that would curtail the guiding business, already hurt considerably by the recent work of the Legislature." So emphatic and strong was the opposition, that Secretary Farrington felt called upon to state, at the close, the reasons for naming the questions for discussion, as he had in making up the programme, which, he said, "are bound to be burning questions with us in a few years, and it is well to thoroughly consider these important points before they are forced to our attention by a great need."

There were batteau, canoe and other races between the guides on Tuesday, and some very interesting contests were carried out. In the afternoon twenty-five guides shot at a wooden deer for a rifle and gun case as first and second prizes, and of the guides entering, only four made scores of 20 and above out of a possible 25. Frank Tomah, a Greenville guide, made a score of 24, with E. E. Harlow 23, and E. J. Masterman 22, all of Greenville. The scores of the majority of the contestants would not indicate that the deer are in great danger from their marksmanship, either in close or open season.

HERBERT W. ROWE.

Meadowlark and Robin.

BUFFALO, N. Y., July 11.—*Editor Forest and Stream*: Coahoma did not quite get my idea in regard to shooting meadowlarks and robins. I did not make a very strong point in reference to shooting meadowlarks for sport, but I do insist that there should be no degree of sportsmanship attached to the shooting of robins.

Audubon may have considered meadowlarks as legitimate objects of sport, but there were many things done in his day in the pursuit of game which would be considered as highly unsportsmanlike in our day. A correspondent in last week's issue of *FOREST AND STREAM* writes that meadowlarks are protected in Kentucky, the Rev. Craig's State, as they are also protected in the State in which he was arrested for violating the law, and if he was any kind of a sportsman he would not hunt without first making himself acquainted with the game laws in the State in which he was hunting.

And this is why we protested against Coahoma defending a lawbreaker, and putting his article in such a way that the game warden appeared as doing something underhanded in arresting him and the Rev. Craig being put to personal inconvenience to which he should not have been subjected.

If the point of view in Mississippi admits of such sport, we will grant that it is a proper thing to do; but if the point of view in Nebraska considers that a man is breaking the law in shooting these birds, Coahoma must permit us to arrest and fine such lawbreakers, and ought to be in sympathy with such action.

I was interested in reading what he had to say about shooting robins in the South. It seems, nevertheless, that

the South has enough of legitimate game birds so that it ought not to be necessary to try one's gun on song birds. While the robin may not sing in Mississippi in the winter, nevertheless he does sing in certain times of the year in the North, and he is a song bird. I have read many of Coahoma's articles with much interest, and feel that he is a good sportsman, and I hope that I may enjoy many more of them in the future, but I hope to see the time when he will be arrayed against shooting these birds, and be for their protection. We may have to bring him North to do it. I have lived in many of the Southern States, though, and never learned to regard robins as game birds.

DIXMONT.

California "Sooners."

SAN FRANCISCO, July 8.—Chief Deputy Vogelsang, of the Fish Commission, is very much pleased over the capture of several game law violators who chose to go hunting on Independence Day, instead of celebrating in the usual manner. The offenders all appeared in various courts of the State yesterday.

Antonio Smith, of this city, was caught with crabs in his possession by Deputy L. N. Kerchival. Judge Fritz separated Smith from \$20.

Deputy W. P. Heustis came upon Eugene Emerson with deer in his possession in the wilds of Humboldt county and haled him before Justice of the Peace Digham, of Scotia, who sentenced the offender to pay \$35.

Deputy A. F. Lee apprehended Oscar Hobard and Harry Mentz with three quail in their possession in the western part of Lake county. The first named offender is the proprietor of a resort in the vicinity of the capture, and his companion, whose home is in San Francisco, was his guest. They were taken to Kelseyville, where Justice of the Peace Hunt imposed an aggregate fine of \$65 and ordered the three quail confiscated.

Nebraska Bounties.

AS THE last Legislature of Nebraska abrogated the wolf and coyote bounty law, the stockman's association have fixed upon a bounty of \$7.50 for each gray wolf slaughtered regardless of sex, and \$15 for a female gray wolf over two years of age. The bounty on cubs is \$2, and on coyotes the same.

SANDY GRISWOLD.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in *FOREST AND STREAM*.

Canoe and Camp Life Along the Delaware River.

XVI.—The Canoe.—Some Musings.

Where the rocks are gray and the shore is steep,
And the waters below look dark and deep;
Where the rugged pine, in his lonely pride,
Leans gloomily over the murky tide;
Where the reeds and rushes are long and rank,
And the weeds grow thick on the winding bank,
Where the shadows are heavy the whole day through,
Lies at its moorings the old canoe.

THE above lines, quoted from memory, have appealed to many a reader, bringing back not only the life along shore after he became an adept with the paddle, but his life as a child, when he watched from the top of the high bank the old birch-bark canoe as it teetered, swayed, and swung, the key of its fastened lock and the coveted paddle both hidden by cautious father or big brother. How he longed for a ride in that canoe all alone; braving the flogging promised to him if he so much as went near it! He remembers the glad morning when he was permitted to sit on its bottom while his brother paddled; and the afternoon when he slowly entered it alone, first peering about to make sure no one saw him, and then pushed it out to the length of the old chain, and nearly tipped it over—a great fright. But it seemed almost a privilege to be drowned by a spill from the charmed, buoyant craft that made him summon visions of feather-decorated Indians, and solemn, blanketed squaws with papposes tied on their backs.

There she floats on the deep pool in the river summoned by memory—tied to a dingy stake or half-decayed log—the old canoe, leaky perhaps, or half filled with rain-water, but also saturated, like the wood of a violin, with water music, leaf music, bird music, wind music. It has its being in a kingdom to be traversed and explored and joyed in when he becomes a man. And then, as Jo Gargery would say, "Wot larks!"

The boy dreams of guiding her over rapids and through cascades, of sailing her on long, still reaches of deep water, and of having the small, specially liked miss, the sunshine of the country school-house a mile away, share those trips with him, to see how well he can wield the paddle. But now the boat is "locked up," her patched and tarred sides dipping and rising into the bar of sunlight that streams through a wide cranny in the overhanging foliage.

"And dizzily out and in again,
It floats the length of its rusty chain."

Even when she is condemned and left to moulder, submerged, on the bottom of that pool, he watches her dim outlines, far down through the slowly passing current. Now his hopes cluster about the new boat being constructed by his father in the woodshed. But even there the stern order of "Keep away" chills and saddens him.

He studies the withes, pieces of bark, overlaps and ribs as the boat slowly takes form. He follows her, fascinated, and dancing his joy, as his big brother lifts it, bottom upward, gets under it, and goes off toward the river—only a swaying pair of straining legs to be seen under a long, gigantic, sky-pointing hat! How easily that canoe is launched. How lightly she floats. And what a puzzle the whole family struggles with in finding a name good enough for her.

Trivial incidents, but vital to that boy; for they make

life precious to him, and stimulate and form tastes and longings that will sway him during his whole life.

Reaching manhood and toil in the whirligig world, his rebellion and longing for escape to the river and a boat will dominate and direct him. He plans a long cruising trip. He studies designs for his little boat, and cons pictures and notes prices furnished by several canoe dealers, talks of the boats which have greatest strength, durability, lightness, tightness, speed and easy paddling and storage room. Cedar skin and ribs, varnished, canvas covering, shellac finish, all well ironed, with a final coat of waterproof green paint or yellow staining! Light planking, shapely thwarts and inside gunwales of "natural wood," copper-tipped paddles, cane seats and well tufted, hair-filled lazy-backs—how he talks and dreams of these details of his craft. He tells of smooth finish, carvel construction, blind caulking, inwales, mast, sails, stay-booms and anchors, meanwhile consulting railroad time-tables, overhauling old clothes, and dodging into shops where tiny tents and cooking utensils are sold. Half the enjoyment is in these incidents of anticipation and "getting ready." He consults with the former miss of the school-house, now his wife, about skillet and tiny kettles, tin plates and cups, rough knives, forks and spoons. He gets one or two water-tight bags to hold "supplies," and fills

Maker." But occasional visits only to scenes of greatest natural beauty will bring these best results most quickly. "We should not always be with nature in her redundant, ceaseless loveliness, else the faculties will be paralyzed by the abundance, and cease to be capable of excitement and best perception. Too much and lasting beauty deadens the senses, for we know little except by contrast." And we should take advantage of that feeling "natural to the human heart, of fixing itself in hope quite as much as in present possession; so subtle is the charm which the imagination casts over what is distant or denied." Besides, the sportsman finds a great happiness in the longing, soon to be satisfied, as he lists his articles needed for the river outing. This is especially true as he handles the paddle beside the canoe in his city home. What revelations the two will bring to him; what nooks it will make accessible, what new meanings his sight will bear to him as all spring and summer are abroad in the world, the life of sunlight upon it with its woods and pacing brooks, kind winds and rains, billows of mountains, and knobs of hills.

And now the voyage closes. Down through the Benekill at the Gap for the last time this year, through the rapids just below, past the islands and into the deep, still water over which tower Mounts Minsi and Tammany. The bow touches the Pennsylvania shore at the ferry

codfish put their heads out of the water to within half an inch or less of their gills, and took the food with a joyful but ill-bred gulp. If the fisherman threw the food far out, the race was to the swift; if he handed it by the edge, the battle was to the strong. There were codfish, haddock and other rovers of the sea, all thriving, fat and happy. They took no notice of us, simply because we showed no anxiety to handle their food, but they were in no way disturbed by our presence or scrutiny. The cod were, perhaps, the boldest; the haddocks, being smaller and less able to thrive in the struggle for existence, swam at the back of their companions and took their chance when food was thrown well beyond the edge. Then they raced, swallowed it, and returned to their accustomed place with a melancholy air apparently intended to deceive the codfish, who might be able to make life unpleasant for them did they so desire. For half an hour we watched these curious fish, until the basket was empty and the fish were tired of swimming to the edge of the water, and saying, through the medium of the gasping noise I have referred to: "We have not had half enough." If some ichthyologist would do for these fish what Professor Garner has done for apes, I am sure that our knowledge would be greatly increased. As no professor was at hand, I turned to the laconic fisherman. "They are a remarkable family," I said encouragingly. "Ah!" he replied, in the tone of a man who has heard a remark before; and then added: "I'm told Barnum's got tame seals." In a moment I realized why the worthy fisherman looked so sad. Barnum and Bailey had been at Stranraer on the previous day, and all the countryside for miles round had been to the greatest noise—I mean, greatest show—on earth. When the quiet lives of the country folk suffer from such an excitement as a circus, there is a violent upheaval of the regular mode of life, and for days it is difficult to settle down into the old routine. The custodian of the tame fish had seen clowns and elephants, and bearded ladies and riders of the haute école, and other strange animals after their kind; he had heard more noise in an hour than he is accustomed to hear in a year; and now all the pageantry had passed, his life, so flamboyant for a few brief hours, had resumed its drab monotony.

Carefully restraining my own feelings about Barnum and Bailey in particular, and all circuses in general, I led the fisherman to talk of the performing seals, and punctuated his discourse with notes of exclamation and admiration, until he came out of his shell and readily told me the history of the pool and its inhabitants.

He pointed out some writing on the stone wall facing the steps. It was the record of a bygone Laird of Logan, who had the pool hollowed in the rock one hundred years ago. There was a natural depression in those days, of which the builder took advantage, and a long period of hard work had made the place as it is to-day. On one side, as I have said, there is access for the rising tide, and as the outlet is cross-barred, the fish cannot escape with the ebb of the waters. There is no need to suppose they would escape if they could. If several generations of the family have passed, the fish have not survived them; the present inhabitants have only been in the pool for a few years. Now and again, at long intervals, the tide does not reach the pool, and the fish mope and die; in seasons of storm it rises far above the ordinary level; the steps have been submerged, and the water has come within a short distance of the cottage level, and then the fish suffer; but the weather that affects the fish pond comes rarely, and the captives live long. The fisherman told me that to the best of his knowledge there have always been one or two tame fish in the water, and they have helped to tame the newcomers. In addition to being an attraction, the pond serves as a store at times, when fish is desirable and the storms forbid fishermen to leave the shore. When it needs replenishing, the fishermen go out and cast their nets. A tank in one of the boats serves to bring the newly caught fish safely to shore, and they are carried to the pool. The taming is not an easy matter. For more than a year the captives are wild and sullen; some do not thrive at all. However, time works wonders; and as visitors must be few and far between, it is hardly surprising to learn that the example of the tame fish is slowly followed, and the wild ones learn to respond to the whistle of the fisherman when he comes down the stone steps carrying provisions. The most curious and incredible action is the rising from the water. That the fish should come to the edge of the pool is not surprising; but until one has seen them, it is hard to believe that they raise themselves right out of the water and snap at the food like half-trained dogs.

From what the fisherman said, I am disposed to believe that only the thick-gilled fish can thrive there, and only these would try to get out of the water to reach their food. The angler knows that a carp taken from the water will live much longer than a trout, that herrings and mackerel die quickly after leaving the water, while eels and cod remain alive for some time. It is likely that these gilled and gregarious fish would not live in the fish pond; while the sturdy species, that travel singly and can remain out of water for some little time, would live and be tamed.

The fisherman's duties are not quite in the nature of a sinecure. To be sure, the ebb and flow of the tide make cleaning operations unnecessary; but the food supply must be constant, and entails a long search over the rocks for mussels, limpets, whelks and other things whose apparent justification for existence is to be found in the favor with which fish regard them. If, as is likely, the extremely cold weather freezes the pool, and the fisherman in charge has to serve it as a decoyman serves his pipes and pond, then the winter at the fish pond must make up in hard labor for what it lacks in variety.

In the summer the fish pond attracts a large number of visitors, considering the extreme remoteness of the place from all large towns, while winter and summer alike it may be seen without fee. The fish do not appear to quarrel, though the newcomers keep as far away as they can from the oldest inhabitants; the big ones do not prey upon the rest, a fact that the regular

THE BENEKILL.

a couple of small bottles with matches and corks them tightly. Then he overhauls rods, reels, lines, leaders and flies, and gets interested in little sleeping mattresses and blankets, cigars, a pocket knife and small hatchet, and a camera. Then he "assembles" his purchases in his den or bedroom, for they are too precious to be left in the kitchen. And he wakes in early morning to find his dream they have been destroyed or burned *was* a dream, and looks and gloats over them as he counts the slow days. He develops interest in personal purchases of sugar, bacon, a ham, beans, and a few cans of fruits. And he puts all these belongings on the drape under his own eye, to make sure nothing is missing. His "women folks" say good-by to him; or maybe his wife braves the coming "hardships" and goes with him, to be astonished, as she is queen of his river camp, to find herself saying that she is having the best time of her life. The two did not enjoy themselves so well even when they were off on that wedding trip, ten years ago. What fun it is to pitch the little tent, hang up the skillet, fix the crotches for holding the suspended kettle and coffee pot over the back log of the camp-fire. How charming the island studded with solemn pines, and how surprisingly good the shelter of the tent.

Then begins the real nature-study—endless and bewildering earth-scrolls and sky-scrolls, infinitely varying music and color. There are thunder-storms to dodge, rapids to shun or brave as they are "shot," fish to catch, pictures to take, meals to be cooked and eaten, dishes to wash, wood to gather, camp-fires to kindle, replenish, watch and love, faces and hands to cover with sunburn and then with tan, every square inch of which is prized.

He has some side trip too difficult or transient for his wife to accompany him, and sleeps under the canoe, gets wet and dries his clothes "on him" in the warm air. They get a personal acquaintance with all manner of native wild birds and animals, studying them through the pair of opera glasses; and storing up a great surplus of health and courage. The all too swiftly passing days are counted as a miser does his dollars. Finally they live the outing over again in town after the "things" are stored for next year's outing, and as they develop and show the photographs. Blessed days of sport, glad nights of real sleep, tired in the body and not in the head. What appetites they bring back with them! And often publications like FOREST AND STREAM will contain attempts to tell others of those joys, although the writer, if sincere, will always lament the inability to shake off self-consciousness, and its consequent attitude of special knowledge of nature, that blighting condition which taints even the poems of such men as Wordsworth, that made even Wagner say as he pointed to his already dug grave: "Even so great a man as I am must die," and that caused a world-famous artist to say before his easel in the heart of the Aude: "How fortunate for mankind that I see all this beauty and sublimity, else no one would have known of it."

Outings like those along the Delaware River charm especially on account of their novelty to the city canocist and camper. It is a piquant life, and certainly should exclude influences for evil, and bring delight in what is noble, refining and pure. This is of vital importance. "From cultivation of love of nature, not in levity and ignorance, but in earnestness and as a duty, will spring results of an importance at present inconceivable, and lights arise which for the first time in man's history will reveal to him the true nature of his life, the true field of his energies, and the true relation between him and his

landing, and this time the tent is not removed to be pitched. We leave the outfit to be loaded and carted to a storage room,

"and from the stream we turn away,
But hear it many an after day."

L. F. BROWN.

The Tame Fish of Logan.

From the Windsor Magazine.

WHEN a friend told me there was a fish pond in Scotland holding tame salt water fish that came half out of the water to be fed, I pretended to believe him, for my tendency is to be courteous to all men. I said no word to indicate a doubt, I did not even follow the example of the skeptical sacristan in one of the Ingoldsby Legends. Tame carp I have seen—at Versailles, in the grounds of the Penha Castle at Cintra, and elsewhere; sea-water fish, I thought, could only be domesticated in the sense that flying fish and dolphins or sharks may be deemed domesticated, because they follow ships. Moreover, travelers' tales are amusing. I could tell many a strange story of animals I have seen in far-off lands. I do not, because they are true tales and would not be believed. The fish story I set down in the category of travelers' tales, only thinking the tame fish should have been located in some less accessible spot than Galloway, for the sake of the story. Some months later than the telling of the tale, I was in Wigtonshire with my friend, and on a fine afternoon in early autumn, he said: "Shall we go to see the tame fish I told you about?" Not liking to take advantage of the man, I said that I would not press the matter, and then he began to see that I had certain doubts.

We left the village on our left and made our way to a small white cottage with outbuildings lying at the eastern point of the bay. A burly fisherman, whose red beard did not match his blue jersey, came out of the cottage and took our measure silently. Then he turned to the little door by the side of the cottage and briefly remarked: "This way." He had divided two words between the pair of us—not without an effort. The door opened suddenly on to a flight of stone steps leading to what looked like a well hewn out of the solid rock, with edges made smooth by the ebb and flow of countless tides. There was an opening low down on one side, through which the sea came and went, keeping the waters of the pool fresh and clean. The laconic fisherman took up a basket containing many unappetizing curios, doubtless dear to fish, but reminding me of the goods purveyed on barrows at street corners in the heart of a London slum on a Saturday night, when vendors, whom no careful man would touch with the far end of a forty-foot pole, persuade the proletariat to buy the dainties in "ha'porths" and "penn'orths," and mercifully disguise the flavor with strong pepper and vinegar. Our guide reached the lowest step, waved his basket, and whistled.

Never came trout to May fly so readily as a score of unmistakable sea-fish came from all parts of the pool, scrambling and jostling against one another as though they had been playing football under association rules. They came to the edge of the step, and there they rested until their guardian took some of the nasty delicacies and offered them. Straightway certain of the

and sufficient supply of food for all may perhaps explain. Apparently no one of the owners of the fish pond has turned his curious possession to account for the purpose of studying the habits of sea-fish; it may be that many interesting discoveries would have been the outcome of sustained observation. I have endeavored to learn something about the habits of fish in every part of the world where sport has been obtainable, and particularly in the Mediterranean Sea, where very many and varied species of fish are to be found. Aristotle knew more than a hundred species of fish inhabiting the Aegean Sea, and he wrote more than 2,000 years ago. From whalers down to salmon poachers I have gone in search of fish lore, only to find that no man has learned more than is absolutely necessary for him to secure the best possible catch in the shortest possible time. It is reasonable to believe that more was known about fish three or four thousand years ago than is known to-day. I will put forward a single justification for this assertion. We all know that the Mosaic Code forbids the eating of certain fish—all, in fact, that lack fins and scales. Modern research has not done much in the study of ichthyology, but has demonstrated that the fish lacking fins and scales are the scavengers of the ocean, that they live upon its impurities. This, with many another truth whose value we are beginning tardily to recognize, was known to Moses and probably to the Egyptians. Observation must have been careful and prolonged, even though most traces of it are lost. It cannot be carried on with much success in an aquarium, for all the surroundings are artificial; in such a place as the Logan fish pond the ways of certain classes of fish could be studied at leisure.

The Logan Pond has served at least to show that fish can be kept in a half wild condition and can be trained to an extent that permits sustained observation. A fish pond established in some spot equally quiet, and withal more readily accessible, would give a valuable chance to ichthyologists. There would be no difficulty about keeping it stocked and supplied with food; and so long as the tide had free and regular ingress and egress, the fish would remain in their natural state. Every species of strong, thick-gilled fish could be studied in turn, and the result of putting one class with another accurately noted. The great difficulty hitherto attendant upon research has been the inability of pelagic fishes to endure any change of water. Sea-water may be the same to the taste all the world over; fish know the difference and are exceedingly sensitive to it. Such a pond would not be of great scientific value, since it would deal with very few of the innumerable varieties of fish, and would leave many classes quite untouched; but it would avail to add largely to our general knowledge. If ponds could be established in the five great zones that embrace the varied classes of fish we know something about—say, for example, in the Behring Straits, the Mediterranean, the South Sea Islands, Tasmania, and the Falkland Islands, the results of careful observation would probably repay the trouble and expense.

S. R. LEWISON.

The Brook Fever.

It occurs to me that the brook fever is both infectious and contagious, as well as a disease easily obtained by induction via the "fly" route. It is incurable, and lasts twelve months in the year. It reaches a magnificent type April 15 each year, and is only brought under control four months later, and even then the graceful rods and bewitching flies are often brought from cover in the den, when the lamp shades are endangered by the swishing in the air as it is related. My, oh, my, will I ever forget it? It was the third attempt, and this time successful. I got them placed just back of a big rock under the boughs of some overhanging willows where the water was swirling in every direction. They had just touched the water when he struck, and then the battle. He instantly broke water—the rushes, the plunges, my fear that I should lose him, the limited space to work him through, my backward plunge, the slippery rocks, the rushing water, my strained leader, the victory, the reaction! "My dear, won't you ventilate this room? It seems insufferably warm here." "Well, it's just twelve weeks from next Tuesday that the trout fishing season opens, and I'm just wondering if the moths have gotten into my flies."

Is this imaginary—is it real? Look back through those precious glades of life where best we love to tread; go over the incidents most inclined to hit your nature in its most tender spots; dig into the cavities of almost forgotten time, only to find that the unwritten history of your life's pleasures should be called "my days with rod and flies;" and envy only the man who has made more casts than you have.

It was Friday, June 27, that I met Mr. Robert B. Lawrence at Broadway and Chambers street, New York, and told him I was leaving for Sullivan county, New York, trout fishing, the following Monday; that Mr. Russell W. Woodward, of Elizabeth, N. J., was at De Bruce, and was writing me of good conditions for sport, and I asked him to go along. He flushed with the fever, hit his pipe a few extra puffs, and said, "I'll go." The meeting for the train was arranged.

On Monday morning, the 29th, it rained as it never had rained before. I could see nothing but flooded streams and disappointment, and abandoned my part of the journey until further notice. Not so with this man of grit and go, this veteran of the rod, this angler that knows how. He waded West street ankle-deep to the ferry and went alone. That unquenchable fire was not to be put out by cloud bursts; that six feet of bone and muscle was not to be daunted by floods. I followed twenty-four hours later, and found my friends behind their pipes, weary but untamed.

The following morning we fished the Mongaup with indifferent success, but willingly. A pretty line of shades and sunbeams seemed to always beckon us on. Then, too, we had in view one Christopher Whipple, who a few years ago dammed off a stream and made a trout pond; this pond is open to the public for anglers who will pay 50 cents per pound for all trout taken there; a great many

dollar trout have been taken, and we have every reason to believe that many more expensive ones remain. We, however, didn't need our pocketbooks. Mr. Lawrence whipped it unmercifully at noon; I thrashed it at five P. M., and Mr. Woodward and I "wormed" it from seven till eight. Often as "the shades of night" intensified the mirror-like appearance of the pond, a big fellow would rise and plunge near us like the drowning of a dog. "So near and yet so far." We moved our boat, made of three boards; then would come a plunge where we had been, and a thousand frogs made merry over our disappointment. We pushed ashore as darkness settled over us with a boat full of tired folks and regrets and a few angle worms, but no fish. Only a few evenings before eight trout that weighed eight pounds had been taken there. Such is the perverseness of things.

Mr. Lawrence's duties called him home that night. Thursday morning Mr. Woodward determined that he would lay up for repairs and take plenty of time for packing up while I fished the Willowemoc, it being our intention to leave for home at 3:30 P. M.

Mr. Royce, of the Hearthstone Inn, sent me to the little hamlet of Willowemoc, three miles from the inn, with instructions to fish the stream down to the next bridge below, a distance of about two miles, believing I would reach there between twelve and one o'clock, when his team would meet me and carry me in to dinner and give me time to pack for the journey home. Surely an arrangement very much to my liking, excepting the fact that my day should be cut so in two.

The pretty spots on the first trout that I ever caught are still bright and distinct in my memory, and always will be, intensified, perhaps, by those taken since; yet each seem different, brightening moods diversifying the time and place, changing somewhat conditions, yet always beautiful; sometimes the day is pleasanter or the brook more bewitching, the water clearer, the shades more brightening to be sure, yet always and under all conditions the speckled little fellows are fascinating. So it was when I waded to the center of the Willowemoc that perfect morning only ten days ago.

This stream is quite different from others that I have fished; it is wider, the waters are more uniformly of one depth, the banks are green with scrub willows, with very few overhanging boughs, with an average of twenty to thirty feet in width, laughing waters of gold and silver framed in green velvet.

At eight o'clock with a "good luck" and "I'll be at the bridge at one," my driver left me. I adjusted my flies, weighted them by immersion and started drawing on my surplus of line, and sending it through the guides, using the shallowest and fastest water for this purpose. The third cast is successfully made with twenty feet of active line and leader and drawn along at a goodly pace, when, with a rush from somewhere in those ripples, a trout darts, and, with an accuracy and speed predestined to carry them through falls and up rapids with a velocity almost beyond our imagination, catches my plain little coachman. My surprise is so great and feelings intense that I'm most carried off my feet, only balancing myself perfectly when that seven-inch trout strikes the water thirty feet back of me. I don't question that trout's dexterity in the water, but I'll warrant his aerial flight broke all former records. Of course he got away, and I have often wondered what sort of a fly he thought it was that caught him and jarred him so, and if he hasn't grown suspicious of all kinds of flies since.

My limped leader and flies drift down to my boots, and tangle themselves in disgust around my staff, while I examine the spot more carefully where that trout broke, and again where he run. It is said that there are times in all our lives when "we wish to be alone." Washington was known to wade through the snow into the woods while at Valley Forge to kneel and pray; and at the battle of Monmouth it is said a lone apple tree received his opinion of Lee.

Boxers and trout fishermen should be endowed with quick recovery, allowing chagrin only to arm them with firmer steps and surer impulses. With the angler, however, the battle is not to the strongest, but to the gentlest. My touch was anything but gentle; that seven-inch trout looked a yard long as it passed before my gaze. The fever, however, was on, and it was with a far more measured sweep of the forearm that I put those flies in motion; with a gentle motion they skimmed along that broken surface of water, with only the wrist muscles in play, when my queen-of-the-water was grabbed by one of those innocent and unsuspecting trout. The fish was coaxingly nursed along through the rapids to my landing net, and flavored my creel. It was then that I wanted company. One hates to get "chesty" and not be where someone else cannot hear the strain on one's braces. Thus we must sometimes suffer alone, and, worse still, in silence.

All of this time I had stood in the one place and thanked heaven I had two solid miles of trout ahead of me, and began blaming myself for carrying only a twelve-inch creel. What would I do with the surplus? Time would tell. I cast by the margin of the stream and again nearer the center, and on across to the other side. Then moved my staff (a young tree) and myself just ten paces (and seven slides) down stream. The margin is reached for and so are my flies. I take one trout and one trout takes one of my flies. I put on another one and have three "nips" while "combing" across that brook. Again I move forward and secure a rise and a fall. Both hold good; the trout to the hook and me to the staff; the trout got the worst of it. Expectancy, thou tyrant, thou leadest me over slippery ways. I see a ripple ahead; I cast near it and feel a jerk; the suddenly loosened flies cast a tiny shadow as they go sailing backward through the air, urged on by the graceful contortions of my rod.

I shall ever be thankful to those who are responsible for my being here that in the days of extreme youth I was allowed to be left handed, because later in life the right hand asserted itself in a firm desire to do half my work, and still performs that duty. In fly-casting I always have a reserve battery and work as near as I can from the middle of the stream and need less rest than my less awkward friends. Yet there came a time on this memorable day when a few more arms would have come in handy. I was having too many rises to rest. My weariness I could only attribute to a bunch of years with none missing. I sat on a rock and lighted my pipe while

my flies drifted away. But there was no peace; a fool trout grabbed one of those flies and held on, and I took him in, and then waded on, my rod moving slower and the burden on my staff increasing. I grew hungry, something very unusual while hunting or fishing; Indian fashion I tighten my belt, get down and drink from the brook, but continue to keep those flies going, each ripple looking more likely, each pool more certain; all of them producing life, each of them proclaiming animation, with now and again a fish for my creel.

My watch had been left at the hotel (it isn't waterproof); I looked at the sun; it told me nothing, except of its warmth. I looked ahead for our meeting place, the bridge, and plunged on, only I found myself changing hands from necessity not from location; I stumble to a grassy bank and sit down, reload my pipe, take another reef in my belt, fill the remaining space in me with water, and settle back on my elbow to dream, become conscious of something behind me, twist around just in time to see a snake uncoiling to make more room for me, swing my staff over my head and put him *hors de combat*, with that creepy sensation that comes to us all in the presence of mother Eve's enemy dead or alive. I move on, casting from the bank. Catch a trout and sit down and begin to count my misspent years, those that we would remodel if we could, and introduce them into the present time, bringing vigor and strength to our middle life. To only fish from four to five hours and play out this way was saddening and disquieting. A creaking rod will not stand the strain. I again take to the stream with the avowed purpose of pushing forward with each cast and resting at the bridge until my driver should come. My twenty trout were weighing thirty pounds and my creel was so in the way that it seemed like a two-footer. Yet with each rise it would assume its natural proportions.

As I came to the bridge, a short while after Mr. Woodward and the driver arrived, it occurred to me what a timely meeting. Mr. Woodward asked me if I "had just arrived there." I assured him that I had, and that I didn't know just what part of me would fall apart first. He then wanted to know "if I was going home to-day." I told him I certainly was, and wanted a sleeping car; then he asked me "if I knew what time it was." To which I replied, "I suppose about one o'clock." He laughingly showed me his watch. It was just five minutes of five. My misspent years instantly dimmed in their importance, and my time of life seemed but natural. For nine solid hours I had fished that stream, thoroughly unconscious of the passing of time. This is the brook fever. My driver had called at one and again at three, and in both instances reported me missing. Mr. Woodward, in his anxiety, came for the purpose of searching the stream. I assured him that I had done that.

T. E. BATTEN.

Nebraska July Fishing.

This is July and the Elkhorn's bottom is dense with full-grown leafage. The early summer flowers are rapidly hiding their bright faces, and the clover, the herdsgrass, and the oxeyed daisy, as well as the rye and the wheat, are falling before the mower. The broad pastures have begun to catch the color of the sun and the growing corn rustles its great green swords in tune with the passing wind. The Elkhorn has fallen to a mere rivulet, and instead of the raucous clamor it kept up all through May and June, the channel cat fisher now only hears a subdued whimper. The killdeer tilts languidly along the wet places just as if her babies were not scurrying in among the tussocks and into the cattle tracks as you advance her way. The buzzard winds round and round in the cool airs beneath the blue dome, above the sheep pasture all the day long. A few more nights and the upland plover's silvery tinkle will fall from the starry skies, and once more the gunner will rejoice, though but briefly. He is poor when he first comes in, but a few days' diet on our fat grasshoppers and he is incased in rolls of fat that even depreciate his gastronomic attractiveness. He lingers here for all too short a time. With the first intimation of cool mornings and evenings he will spread his abnormally long pointed wings, and, with that far reaching and ever thrilling "tur-wheelie! tur-wheelie!" will sail away for the sunny plateaus of New Mexico and Texas. But ere he does I will at least spend one day with him. Then let him go, I say, to offer his best to other sportsmen not so well favored as we. Won't we soon have chicken and quail, and geese and ducks, and jack snipe, too, in myriads and hordes, and can't we put in our time while we are waiting for them quarreling with the black bass and croppie under the umbrageous cottonwoods and maples? Isn't it better to tap the cool veins of bass or pike, pickerel or sunfish, these burning dog days, than the hot arteries of rankly fat plover and fledgling doves?

Get out your fishing box and corduroys and hie yourself up to fair Washington's charming shores; Pat Sheehan at the Red Squirrel's Nest will treat you, just right, and then, when the days begin to shorten in earnest, and that master of the brush, Jack Frost, begins to dab the sumach leaves with blood, and the maples with topaz and scarlet, get down your Parker and look it over for days on the yellowing marsh and mouldering field.

SANDY GRISWOLD.

JULY, 1903.

Mrs. Burger's Big Fish.

RANGELEY LAKES, Me., July 8.—The biggest catch of the season occurred to-day in the waters of the Mooselookmegantic Lake, the largest of the chain of the Rangeley lakes, and to the chagrin of all the male fishermen it was accomplished by a woman. Mrs. Henry P. Burger, of New York, caught within half an hour the two biggest land-locked salmon taken out this season, each of them tipping the scales at 8 pounds, and landed them without aid or guide.

W. E. PACKARD.

Mixed Metaphors.

A minister, winding up a special meeting, said in his prayer: "And if any spark of grace has been kindled by these exercises, we pray Thee water that spark!" And this recalls the remark made by another minister at a welcome service: "And with the new pastor at the helm, the church will soon occupy the ground."—Richmond, Va., Religious Herald.

CHICAGO AND THE WEST.

Western Salmon Anglers.

CHICAGO, Ill., July 10.—Mr. W. B. Mershon, of Saginaw, is just back from his annual trip to the Cascapedia and reports rather an unsuccessful season thus far, his personal advice being as below:

"Tom Harvey, Billy Jr. and I returned from the Cascapedia last Thursday afternoon. We had 14 days on the river and did not do very well. We took seven salmon among us, the largest being 39 lbs. We got a few large trout also; I got one weighing 5½ lbs. and another 3½ and Billy, my 14 year old son, took one weighing 4½ lbs. on a little 6-ounce rod with a small fly. The fish put up a splendid fight and the youngster handled it like an expert. Mr. Harvey also took a 4½-pounder.

"Nearly every river was in the dumps for salmon fishing this year; I did not hear of any one who really thought they had big luck. Mr. R. W. Paterson of New York who is joint owner with me in the fishing on the Cascapedia got down there early. I did not arrive until the 15th so he had been there two weeks before and took 20 fish up to the time of our arrival. He took 7 while we were there, making 34 taken from our waters this year. There possibly was an early run of fish that went up on the spring freshet the last of May, but there was no intermediate run that we usually get the first two weeks of June. By the time we arrived, the water was so low and clear, it was very hard to get a rise and there were very few fish in the river. But the last week of June a good many fish came in; we could see ten or twelve in the pools and nearly every pool has fish, but it was out of the question to get them to take the fly. We fished early and we fished late; we fished with a small line and a fine fly and did everything we knew of to coax them, but it was no use.

"The sea trout were also late in coming and it was counted a poor year all the way through. The natives said there were large numbers of sea trout going down the river in the early spring on their way to the sea but they were lean, thin and nearly all head. The few we met on their pilgrimage up stream the week we came away were great, fat, lusty fellows.

"Waldo Avery and his friend, Keena, of Detroit, rented the Barnes waters for July on the Cascapedia. Avery is always lucky. The day he arrived a big rain storm came in, something we had waited two weeks for and did not get a drop. The river rose and the salmon began to take, so his wife took one and he two on the day following the rain. Keena had four trout weighing 17 lbs. They were certainly in luck.

"Walls Humphrey of this city got home yesterday. He has had two weeks with Charlie Davis on the Little Pabos and they took 32 salmon. The salmon there, though, run small. They reported excellent trout fishing as well but had to limit themselves owing to their inability to do anything with their fish. Mr. Tanner of this city has now gone to join Mr. Davis, who will remain two weeks longer."

Western Trout Fishers.

The party of Chicago anglers, as finally made up for the Grand Rapids trip, consists of Messrs. Peet, Smith, Church, Chadwick, Letterman, Brown and Hascall, of Chicago, who left by boat Thursday night for Holland, Michigan. These gentlemen were to have spent to-day, Friday, in Grand Rapids, and should leave to-night for a short camping trip which will undoubtedly be on the Pine River, and not upon the Pere Marquette, as was the original intention. They will be accompanied by Mr. John Waddell, of Grand Rapids, and by Mr. Avery, the well-known railroad man of that city. The Pine River is reported to be in fairly good condition at this writing and there should be offered at least some morning and evening fishing, although the season is now well advanced and the days have of late been exceptionally warm. One or two graylings have been taken in the Pine this summer.

Members of Kinne Creek Club of Wingleton, Mich., most of whom are residents of Saginaw and Detroit, have had better luck than usual on their recent trips to the club stream, and have taken numbers of fine fish.

The Pine of Wisconsin.

Every district in the Rocky Mountains has an "Old Baldy" mountain and every western State has a "Pine River." The Pine River of Wisconsin is indeed somewhat multifold. I have often mentioned the Pine River of Waushara county, which is preserved by Mr. B. K. Miller, of Milwaukee. On the Fourth of July Mr. Miller, his associate, Mr. John D. McLeod, and myself, took a turn at this beautiful little river. The weather was very hot and the three rods in two days, after hard work, took only 98 fish. Among these were several beautiful specimens for this part of the world. On the last evening's fishing Mr. McLeod, using a No. 6 professor, killed five trout, any one of which would have gone over a pound. Mr. Miller had one or two specimens of similar weights. The fishing was extremely difficult. The trout are numerous, but at this time of the year in this clear water they become very shy, so that one needs to strike as soon as he sees the movement of a fish in the water. Mr. McLeod stuck to the professor. Mr. Miller found coachman as his best steady fly.

How to Cure a Poacher.

The most persistent poacher on the Pine River is a Danish woman, wife of a neighboring farmer, who does not speak English, but who delights in night fishing for trout. She has worn nearly bare a big place on the grassy front of one of the best trout pools on the stream, and nothing that William Wood, the keeper, could say to her has thus far served to teach her to mend her ways. Had it been a man the matter would have been simple for the husky William, but it being a woman his natural sense of gallantry gave the situation additional difficulty. Under these circumstances, he sent down to Mr. Miller for a dark lantern, and last week, one dark night, he crept up to the clump of trees near which the old lady does most of her fishing. She was there as usual. William turned the

light of the dark lantern full upon her and for the time thought he would have to do some life saving, as she came near jumping into the creek. Gathering her skirts about her and abandoning her fishing rod, she started home on a gallop. William did not disclose himself, but kept the full light of the bullseye turned upon her as she crossed the bridge and headed over the meadow. The next day there were rumors in all the countryside to the effect that a luminous-eyed ghost was walking the Pine and that it was no longer safe for a lady to catch a few trout for breakfast, even on the darkest night.

Wrinkles.

The prettiest fly book I ever saw was that made for Mr. B. K. Miller by Mr. McLeod, whom I have often mentioned as a very successful amateur artist in fly fishing material. Mr. Miller's fly book is so arranged that all the leaves are easily detachable and can be spread out on a table like a map, although when in place and bound by the metal clip at the back, which constitutes the main feature of this book, the fly book as a whole is square, solid and durable. On the leather surface of the front and back of this book Mr. McLeod has engraved, very skillfully, diagrams of the most useful knots used by anglers in fly fishing, so that he who runs may be able to read. All the book is the product of his own labor and is so beautifully and artistically done that it is very much worth mention.

The adherents of the Woodpile school ("The Woodpile" being the name of Mr. Miller's fishing lodge on the Pine River), are at present gone over to the cult of the detachable butt piece for fly rods. Mr. Miller, when ordering his last fly rod, instructed the builder to make it in three pieces, the middle and top joints and the short butt piece, into which the second joint fits by means of a long and strong ferule. He became converted to this notion through his friend, Mr. McLeod, who altered a six-ounce Leonard fly rod to these dimensions not long ago. Mr. McLeod also changed his own pet fly rod to this style and has built butts for several of his friends. The beauty of it is that one may have three or four rods, that is to say, the middle piece and tips of so many rods, all carried in a screwtop piece of bicycle tubing, water proof, wagon proof and boat proof. To handle so many rods he needs but one or at the outside two of these detachable butts. The butt is short enough to carry in a valise. The hang of the rod is not altered in any way, and these gentlemen and their friends at least believe that this is the only true theory of rod equipment.

Divers other Western anglers are rapidly swinging to the notion that the day of the snelled fly is short and soon to come to an end. The eyed hook is having a great boom in this part of the world at present. There are many things in its favor, and not a few against the snelled hook of our fathers. The main trouble with the latter is that it is apt to snap off at the head of the hook. Another great detriment is that one can hardly buy two sets of hooks mounted on the same thickness of gut, or the same color. When one looks through his book of snelled flies he finds all sorts and conditions, and rarely any fly so mounted that it matches perfectly with the leader which he purposes to use. With the eyed hook one can build his leader to suit himself and so insure uniformity in his scheme. If there be anything different in the color or thickness of gut then certainly there is something desirable in having one's leader, clear down to the head of his fly, of the same color and general appearance. It is a little more troublesome to attach eyed flies in ordinary fishing, but this is something to which one soon becomes used, and it tends toward that very desirable form of sport, fishing with the single fly, which is neater, cleaner and perhaps fully as deadly as using two or more flies on the cast. The single fly and the eyed fly are both coming into very rapid favor here.

The Bass Anglers.

A party, between 20 or 30 in number, left for Bass Lake, Ind., to-day, taking advantage of a good excursion rate. This lake was formerly known as Cedar Lake, but the name conflicted with Cedar Lake on the Monon, and was changed to Bass Lake. The fish have been rising well there for a week or so, mostly in the evening.

The Lauderdale chain of Wisconsin reports good bass catches this week, fog in the evening being the key thereto.

For the Coast.

Dr. R. B. Miller starts to-day for a long trip in California and Washington, rainbow trout being his reason therefor.

Tip for Trout.

The mouth of the Batchewan River, via Laurel, from Sault Ste. Marie, is a good trip for big brook trout. Mr. Marriott, of the Park Hotel, at the Soo, will make proper camping arrangements. One party just in showed a dozen trout, 3 lbs. up to 4½, and the sport is thought to be fine.

E. HOUGH.

The Crescent Moon.

AMONG the various things which children ought to learn is the art of seeing. It is astonishing how much we see without really being able to report what we have seen. We are very familiar with objects and scenes which we recognize when they come again under our eye, but which we could not describe when they are out of sight. Let me illustrate by reference to one of the most familiar of all sights—the phases of the moon. I have often taken pains to inquire of young children, say, of 10 years of age, what they have observed about the moon, with the result that, while they have noticed that it changes its apparent form, they not only could not explain the cause of the change, but never even had had the question, why the changes take place, suggested to their minds. And, not only that, but they will seldom be found to have noticed any law in the changes. If asked, for example, at what time of the day, and in what part of the sky the new

moon is to be seen, they will seldom, if ever, be able to tell. If the new moon should suddenly begin to appear at evening in the east, and the full moon in the west, I venture to conjecture that few children would think that anything strange had happened. And I should not wonder if it should in such a case turn out that a very large proportion of adults also would fail to observe the miracle.

More particularly, how many, whether children or adults, could tell, except when they are looking at it, what position the horns of the crescent moon hold with reference to the sun or to the earth's horizon? Here again I venture to guess that, if, from now on, the concave side of the crescent should be directed toward the sun, the great majority of men would never notice the abnormality, unless their attention were called to it by the more intelligent observers. If this seems to any one a questionable suspicion, I may fortify my opinion by the fact that even many artists have actually represented the new moon as standing in this impossible fashion. And artists surely, of all men, should be those who accurately observe the things which they try to reproduce on the canvas. Not to indulge merely in generalities, I may remark that in the large window of the new Old South Church in Boston, in the picture of the Nativity, may be seen the new moon with its horns pointing downward. This is bad enough in itself; but this is not all that is questionable respecting the phenomena. For doubtless the artist meant to represent the song of the angels as taking place by night, probably about midnight; certainly not during the evening twilight. But at midnight no new moon was ever yet seen; and what motive can the artist have had for introducing such an impossibility into a work of art, whose only legitimate object can be to represent what has been, or might have been, a fact? Doubtless he had no idea that it was an impossibility, and had never observed that the new moon is seen only in the evening, and is never seen with its convex side turned away from the sun. If there is any comfort to be derived from having distinguished companions in his ignorance, the artist can get it by learning that even Walter Scott shared it; for in his "Bridal of Triermain" (canto III., stanza V.) he says:

And now the moon her orb has hid,
And dwindled to a silver thread;
Dim seen in middle heaven;
While o'er its curve careering fast,
Before the fury of the blast,
The midnight clouds are driven.

This is said, it is true, not of the new moon, but of the old moon, after it has "dwindled" from a "full orb" to a "silver thread." But the blunder is essentially the same; for the old moon, when it has dwindled to this extent, can be seen distinctly only in the early morning before sunrise, not at midnight. It is to be found "in middle heaven" only a little before midday. It cannot be supposed that Scott is here indulging in poetic license; there is no poetic gain in thus distorting the facts of nature. Minute and accurate as he was in his observation in general, we must assume that in this case he was misled by "ignorance, pure ignorance." Should an apologist of the artist of the Old South picture imagine that he intended to represent the angelic song as sung in the morning twilight, when the old moon might have been seen in its slender form, it can only be said that this suggestion, improbable in itself, still does not justify making the horns point downward—a representation as needlessly false to fact as it would be to picture the sun as square instead of round.—C. M. Mead in Springfield Republican.

The Everglades.

Florida Letter in Chicago Advance.

As you look out over the everglades there is no limit but the horizon. They stretch from ocean to gulf. There are 4,000 square miles of them. In every direction they seem the same open spaces filled with sawgrass or pools of water, clumps of small trees; more sawgrass, more water, more clumps of trees—hammocks they call them. Thus they spread, so I am told, from ocean to gulf, and from the great Lake Okeechobee down to the tip end of the State. The everglades are one of nature's peculiar experiments in Florida—for there was much experimenting here countless ages before men and women from the North began to scatter superfluous wealth in this direction. In those ages when nature was long on time, it had an old sea where the everglades now are, and for some reason it tired of the old thing and concluded to fill it up and make something else. So it turned to and dumped into it all the refuse of the watersheds or tablelands further north, the drift, alluvium, sand, leaves, logs, grass, muck, faded lilies, worn-out alligators, frogs, etc. And this filling up process was possible, because of the peculiar formation of the basin. Set a saucer on a table and consider the east side of the saucer the Atlantic Ocean and the west side the Gulf of Mexico, and you will have a figure of the old basin which was turned into the everglades. The bottom is higher than the surface of the ocean and the gulf, and the rim of the saucer, which is composed of coralline limestone, kept the water within until the flood of deposits coming from the higher land of the great lake region of the State filled it up and forced it over the sides. In seeking outlets the overflowing water made such rivers as the Miami, Snook, Arch, Shark, and others.

Instead, therefore, of being a very low swamp, the everglades are some 15 or 20 feet higher than the Atlantic. This feature makes drainage quite possible. It is a matter of money, and the Government seems to be aching to put a lot of money into ditches. Once drained there would be lands there with the richest soil this side of Egypt, lands which would produce vast crops of sugar and early vegetables for all northern markets. It was during the first days of March that I visited the fields which have been reclaimed by drainage, and I found sweet corn in ear and tomatoes and other vegetables ripe. Of the 3,000,000 acres of land covered by the everglades, it is thought that at least one-third might readily be turned into the most valuable of farms.

The only people now in the everglades are the Seminoles.

Indians; and they are there for the same reason that wild deer are in the deepest recess of the forest, because they have been hunted to their last hole—a sadly significant reminder of the way in which the white man has borne his burden. The official who was sent among these Seminoles to take the census three years ago found only 339 persons. But Bishop Gray, who knows them better, perhaps, than any other man in Florida, tells me that there are about 450 of them, and that they are increasing instead of decreasing, as is so commonly asserted. They live by trapping otter and other game; and alligator skins also bring them some money. But the Florida alligator is being hard pushed by white hunters, and even this scaly dependence is likely to be taken from the Seminole. Mr. Flagler also has it in mind to run a branch road over in to Big Cypress Swamp to tap that great cypress forest, and when this is done there will be more white man and less Indian. Already at the jumping off place, the Seminole will then be between "the devil and the deep sea." Above all things he seems to dread deportation to Indian Territory. However, as a last resort, he might take to civilization, roll up his sleeves, roll down his pantaloons, and go to work. But from this the older ones are averse, so the bishop says, and only the younger ones are accessible to religious teachers, or other civilizing influences.

The specimens of the tribe which I saw at Fort Lauderdale, a point which they often visit, were handsome, healthy looking men. Their ideas of dress are so peculiar that at first glance it is not easy to tell whether the person who stands before you is some new woman come to town, or some old man who has borrowed his wife's clothes to decorate the upper part of his body and left the lower limbs to the play of the breezes and the whisk of the mosquito's wing. But they are picturesque and interesting.

Fishing in Roger Williams Park.

PROVIDENCE, R. I., July 6.—*Editor Forest and Stream:* The fishing at the lake at Roger Williams Park opened on July 1, as was expected, but up to date nothing unusual in size has been caught. The largest pickerel so far is given at 3¾ pounds. I saw one caught which weighed over 6 pounds. An eel of 30 inches was caught July 4, but no angler envies anyone all the 30-inch eels he wants to catch.

The number of pounds allowed is as follows: One person, 8 pounds; two persons, 15 pounds; and three persons, 20 pounds; this refers to parties in boats.

This limit has been reached, but the fish, except as above stated, have all been of ordinary size.

No bass have been heard from yet, although they were planted there about eight years ago. (Bass fishermen wanted.)

White perch will probably be the best fishing to be had, and some nice ones of one pound and 1½ pounds have been caught, which is all right for this species.

The price of boats has been changed from 50 cents per hour to 25 cents per hour, and 25 cents per man in each boat, which is not unreasonable for good sport.

All kinds of tackle are used, from the birch and alder poles cut from nearby woods to the natural reed poles 16 feet long. (Imagine fishing from a boat with a pole 16 feet long!) Of course, the up-to-date angler is there with his light split bamboo rod and other tackle to match, but it is surprising how many "old time rod" men are to be found in this city where there are so many lakes and rivers of easy access by trolley and several first-class tackle stores where the right goods can be bought.

The writer will leave the amount required on deposit and give boat price for the privilege of fishing from the banks, as there is scarcely any part of this 100 acres of lakes where a bait-caster cannot reach the middle from land. The sport is growing more popular each day, and many ladies are availing themselves of the opportunity to fish here, while the open season is on, which will probably last till cold weather sets in. SELDOM.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

92

SOME few weeks ago A. E. Levy, of 529 Broadway, went fishing down at the Fishing Banks. His luck was not exceptionally good, but when he reached home and the catch had been cleaned he found that he had broken the record. In the stomach of a cod was found a ten-dollar gold piece, with two diamonds set on one side and the initials "P. C. E." on the other. Mr. Levy was so amazed that he sent the story to the papers, and it was copied throughout the country. This he thought would be the end of it, and the matter slipped from his mind and was forgotten. But yesterday he received a letter from Patrick C. Evans, residing in Kansas, who claims the ten-dollar piece as his own, and Mr. Levy will surrender it to him. Mr. Evans in his letter tells the following story:

"I some days ago saw in a St. Louis paper an item about your catching a codfish which when you opened it gave up a ten-dollar gold piece, on one side of which was a couple of diamonds and on the other the letters 'P. C. E.' The coin is my property, Mr. Levy. The coin is valuable to me, for the following reason: I was fool enough about five years ago to go into a 'wildcat' gold mining scheme in Colorado. I paid the piper to the tune of about \$4,000 before I found out what I was up against. The only thing I got out of the enterprise was this same ten-dollar piece, which I borrowed from the president of the company, a man named Harris Colby, at Leadville, Col., having only a check in my pocket at the time, and being shy of ready money. As it happened, I did not change it, and the next day the mine busted up. So I said I would keep the coin as a warning to me not to be played as a sucker by any man or men who owned gold mines. Frank H. Wells, a jeweler, of Denver, Col., put two diamonds in the piece, and also put my initials on the date side, charging me \$30 for the job, and I guess the transaction is still on his books if you wish to verify my statement.

"I wore the coin some years, and it made good when-

ever I was tempted to go into some scheme that promised a bunch of money for next to nothing invested. I was in New York on May 4, and remained over for some time with friends. We went blackfishing in the lower bay, and I was hauling in a fish, when somehow or other the chain to which the coin was fastened got caught in the rigging of our sloop, which just then rolled, the chain snapped, and away went the coin. You can prove the truth of this if you will write me, when I will write and send you the addresses of witnesses of the accident. I will also give you references of good men here and in New York, who will vouch for my business and moral character. I am interested in the salt industry of this town, and have also mining and ranch interests."—New York Times, July 8.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

America's Cup Races, Aug. 20 and alternate days.

JULY.

15. Eastern, cruise, Marblehead to Vineyard Haven.
16. Eastern, cruise, Vineyard Haven to Newport.
16. New York, fifty-eighth annual cruise, rendezvous Glen Cove.
17. Eastern, cruise, Newport to New London.
- 17-18. Pascagoula, Southern Gulf Coast Y. A., Pascagoula, Miss.
18. Beverly, second Corinthian, Monument Beach.
18. Keystone, club, Woodmere, L. I.
18. Atlantic, club, Sea Gate.
18. South Boston, club, City Point.
18. Penataquit Corinthian, special, Bay Shore.
18. Indian Harbor, motor boat race, Am. P. B. A., Greenwich.
18. Seawanhaka Corinthian, club, Oyster Bay.
18. Corinthian, third championship, Marblehead.
18. Savin Hill, club, Dorchester Bay.
18. Canarsie, club.
18. Riverside, Y. R. A. of L. I. S., annual.
18. Corinthian of Stamford, Y. R. A. of L. I. Sound.
18. Corinthian, 3d champ., Marblehead, Massachusetts Bay.
18. Winthrop, Y. R. A., open, Winthrop.
18. Chicago, races for Warrington and Lillienfeld cups.
18. Royal Canadian, L. Y. R. A., skiff races, Toronto.
21. Inter-Lake Y. A., open, Put-In-Bay.
22. Inter-Lake Y. A., open, yacht and power races, Put-In-Bay.
23. Inter-Lake Y. A., squadron sail and auxiliary race, Put-In-Bay.
24. Inter-Lake Y. A., open, Put-In-Bay.
- 24-25. Biloxi, Southern Gulf Coast Y. A., Biloxi, Miss.
25. Indian Harbor, club, Greenwich.
25. Beverly, cruise, rendezvous Monument Beach.
25. Boston, club, Hull.
25. Seawanhaka Corinthian, club, Oyster Bay.
25. Royal Canadian, L. Y. R. A., skiff races, Toronto.
25. Hartford, Y. R. A. of L. I. Sound, special.
25. Marine and Field, Y. R. A. of Gravesend Bay.
25. Hempstead Harbor, Y. R. A. of L. I. Sound, annual.
25. Bridgeport Y. R. A. of L. I. Sound, annual.
25. Chicago, club, Lake Michigan.
25. Penataquit Corinthian, cruise, rendezvous Bay Shore.
27. Atlantic, club, Sea Gate.
- 27-29. New York, Newport series, all classes, Newport.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.

Second prize, \$50.00.

Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

SHAMROCK III. established a new record over the thirty-mile windward and return course off Sandy Hook on July 6. She covered the course in 2h. 58m. 37s., and beat Shamrock I. 6m. 18s. The race was sailed in a breeze that varied in strength from five to ten knots an hour. Course signals were set on Erin at 12:10, and the two boats were sent away five minutes later. Both crossed on the port tack with the new boat ahead and to windward. Sheets were eased well off and the boats followed in the wake of the tug Cruiser that was logging off the course. Shamrock III. carried a balloon jib topsail while a baby jib topsail was broken out on the old boat. This sail was replaced with a No. 1 jib topsail and a balloon staysail was also set. Shamrock III. dropped Shamrock I. very fast. The wind was W. N. W. at the time of the start, but it shifted after the boats gybed around the outer mark, and the boats were able to lay their course

back to the finish line at the lightship. At the outer mark the challenger led Shamrock I. by about four minutes. The breeze increased a good deal so that on the reach to the finish line the boats moved along at a smart clip. The old boat was a long distance astern when Shamrock III. swept over the finish line. The summary follows:

	Start.	Outer Mark.	Finish.	Elapsed.
Shamrock III.	12 15 13	1 44 25	3 13 50	2 58 37
Shamrock I.	12 15 32	1 48 50	3 20 27	3 04 55

On the broad reach to the outer mark the challenger beat Shamrock I. 4m. 6s., and over the entire course she beat her 6m. 18s.

On July 8 the two boats again met off the Hook. The challenger did not make a very creditable showing, and only beat the old boat by a small margin. Shamrock III. carried her biggest club topsail. The start and finish were made off Sandy Hook lightship. At the time of the start the wind had a strength of about six knots and was a little to the W. of N. The course was a windward and leeward one, and it was logged off by the tug Cruiser. It was a down the wind start, and the old boat had a little the best of it. The challenger luffed across the stern of Shamrock I., and both set spinnaker and balloon jibs. The wind had shifted to W. by S. Shamrock III. opened up quite a gap on the old boat, and she rounded the outer mark over a minute ahead. Baby jib topsails were set on both boats for the windward work. They were able to lay their course for the finish line after making three tacks, as the wind had hauled around to W. N. W. The old boat did splendid work in the stronger breeze. The summary:

	Start.	Outer Mark.	Finish.	Elapsed.
Shamrock III.	11 56 19	1 19 00	3 18 59	3 22 40
Shamrock I.	11 56 14	1 20 05	3 23 03	3 26 49

Shamrock III. wins by 4m. 9s.

Sir Thomas Lipton was not entirely satisfied with the showing made in this race; so on the day following the challenger was docked in Erie Basin, and after cleaning her bottom a fresh coat of enamel was applied. Before going in the dock the mast Shamrock III. had been using was unstepped and the spar she used in her later trials abroad was put in its place. This spar is some four feet longer than the one that was removed.

Winthrop Y. C.

WINTHROP, MASS.,

Saturday, July 11.

The regular class handicap race of the Winthrop Y. C. was sailed off the club house Saturday, July 11, in an unsteady S. E. breeze. In the 25ft. class, Idalia led all over the course and won on both elapsed and corrected times. In the 21ft. class Opechee led easily around the course, but lost on corrected time to Rhubena. In the 18ft. class there was a close race. Louise and Zetes II. had a hot scrap all over the course, Louise finishing four seconds ahead. First place, however, went to Mentor, the third boat to finish, on corrected time. Eva finished first in the 15ft. class, but lost to Dot by one second on corrected time. The summary:

25ft. Class.			
	Finish.	Elapsed.	
Idalia, J. E. Lester.....	1 49 30	1 44 30	
Eclipse, F. Jenkins.....	1 55 34	1 45 34	
Kit, H. B. Whittier.....	1 54 00	1 48 00	
Calypso, A. W. Chesterton.....	1 50 31	1 50 31	

21ft. Class.			
	Finish.	Elapsed.	
Rhubena, J. J. Wilde.....	2 23 33	2 05 33	
Opechee, Mr. Gilmore.....	2 19 20	2 09 20	

18ft. Class.			
	Finish.	Elapsed.	
Mentor, Cobb and Brainerd.....	1 15 54	1 11 54	
Louise, W. D. Allen.....	1 14 43	1 12 43	
Zetes II., J. A. McKie.....	1 14 47	1 14 47	
Marion, C. A. Newarch.....	1 23 26	1 15 26	
Sioux, G. J. Buchanan.....	1 35 08	1 22 08

Omene, Mr. McDowell.....	1 33 45	1 24 45	
Henrietta, J. J. McCloskey.....	Did not finish.		

15ft. Class.			
	Finish.	Elapsed.	
Dot, Dr. Maynard.....	1 30 52	1 20 52	
Eva, H. G. Flinn.....	1 28 53	1 20 53	

Cohasset Y. C.

COHASSET, MASS.,

Saturday, July 11.

The last race in the first series of the Cohasset Y. C. was sailed Saturday, July 11, in a fluky S. E. breeze. In each of the classes the wins were by about the same margin. In the 21ft. class, Eleanor won. Result won in the 18-footers, and Willie in the handicap class. The summary:

21ft. Knockabouts.			
	Finish.	Elapsed.	
Eleanor, Moore Bros.....	1 50 50	1 50 50	
Delta, Ralph E. Williams.....	1 53 18	1 53 18	
Eleanor, Alanson Bigelow, Jr.....	1 53 54	1 53 54	
Remora, Courtney Crocker.....	1 54 35	1 54 35	

18ft. Knockabouts.			
	Finish.	Elapsed.	
Result, A. H. Knowles.....	2 00 00	2 00 00	
Sabrina, H. W. Hyde.....	2 03 03	2 03 03

Handicap Class.			
	Finish.	Elapsed.	
Willie, H. B. Cousens.....	1 07 40	1 07 40	
Katrik, J. R. Chapin.....	1 10 18	1 10 18	
Undine, Gilbert S. Tower.....	1 13 15	1 13 15	
Olympia, Sheldon L. Ripley.....	1 15 18	1 15 18	
Castrel, Curtis Parker.....	Withdrew.		

Mattapoisett One-Design Class.

MATTAPOISETT, MASS.,

Saturday, July 11.

The one-design class of 15-footers, designed by Messrs. Burgess and Packard, were raced off Mattapoisett on Saturday, July 11, in a whole sail S. W. wind with a choppy sea. They were bunched pretty well all over the course, No. 8 winning by 35s. The summary:

Start, 3:30.			
	Finish.	Elapsed.	
No. 8, Edward Stone (Marion).....	4 54 00	1 24 00	
No. 1, S. D. Warren, Jr.....	4 54 35	1 24 35	
No. 3, J. L. Stackpole, Jr.....	4 54 40	1 24 40	
No. 2, Mr. Lothrop.....	4 55 07	1 25 07	
No. 6, J. R. Maury (Coot).....	4 55 36	1 25 36	
No. 10, Miss Means.....	5 09 00	1 39 00	

We are indebted to Mr. William Avery Cary, secretary of the Boston Y. C., for a copy of the club book.

Larchmont Y. C. Race Week.

LARCHMONT, LONG ISLAND SOUND,
Monday, July 6.

On Monday the second of the series races was held at Larchmont, and thirty-six boats started in the different classes. It proved to be a very unsatisfactory racing day, for the wind was light and variable. There was a nice S. W. breeze at the time of the start, but before the boats had finished the first round it had veered around to N. W. From this time on it was very light and fluky, and before the boats finished it was back to S. W. again.

The preparatory was given promptly at 11:30, and five minutes later boats in classes I and J were started. They sailed twice over a fifteen-mile triangle. Weetamoe had all the luck, and at the end of the first round Neola was so far behind that she was withdrawn. The bronze boats Neola and Weetamoe were sailing against the English boats Eelin and Isolde. On the second round Weetamoe got becalmed and was passed by both Eelin and Isolde. Eelin won from Isolde by less than three minutes.

Aspirant and Mimosa II. met again in the special class. The latter boat stood too far in toward Matinicock Point and went aground. She was towed off, and on examination was found to be uninjured. The race committee stopped Aspirant at the end of the first round, as she had no competitor.

In the regular 43ft. class, Effort won again easily from Mira and Challenge. Hebe, the fourth starter in this class, withdrew.

Flosshilde had no competitor, so she went up a class and sailed against Spasm and Anoatok. Flosshilde did not finish, and Anoatok won with ease. This boat is sailing in great form this year, and is sweeping everything before her.

Three of the Larchmont 21ft. one-design boats started, and Dorothy won, Houri finishing second.

Hope beat Spoonbill and Lively in the C. F. Herreshoff one-design class. Spoonbill got second money.

There was a good list of starters in the raceabout class, some eight boats crossing the line. Hobo won and Jolly Tar was second.

Arizona and Bob had a close race in the Manhasset one-design class, and the latter won by a narrow margin. The summary follows:

Sloops—Classes I and J—Start, 11:35—Course 30 Miles.			
	Finish.	Elapsed.	
Weetamoe, Henry F. Lippitt.....	6 25 04	6 50 04	
Neola, George Pynchon.....	Did not finish.		
Isolde, F. M. Hoyt.....	6 05 27	5 30 27	
Eelin, F. L. Rodewald.....	6 02 35	5 27 35	
Sloops—Class L—Start, 11:40—Course, 22 Miles.			
Effort, F. M. Smith.....	5 13 20	5 33 20	
Mira, C. L. Poor.....	5 30 31	5 50 31	
Challenge, Wallace T. Foote.....	5 35 22	5 55 22	
Hebe, H. Smithers.....	Did not finish.		
Sloops—Special L Class—Start, 11:40—Course, 22 Miles.			
Aspirant, H. W. and A. H. Hanan.....	2 40 35	3 00 35	
Mimosa II., T. L. Park.....	Did not finish.		
Sloops—Class M—Start, 11:45—Course, 22 Miles.			
Flosshilde, W. D. Hennen.....	Did not finish.		
Spasm, J. Berre King.....	5 56 39	6 11 39	
Anoatok, W. G. Brokaw.....	5 33 08	5 48 08	
Larchmont—21ft. Class—Start, 11:50—Course, 11 Miles.			
Adelaide, J. J. Dwyer.....	4 22 06	4 32 06	
Houri, J. H. Esser.....	4 05 03	4 15 03	
Dorothy, L. T. Spence.....	4 02 17	4 12 17	
Charles Herreshoff One-Design Class—Start, 11:55—Course 11 Miles.			
Spoonbill, August Belmont, Jr.....	7 27 11	7 32 11	
Hope, Adrian Iselin.....	7 26 26	7 31 26	
Lively, C. O'D. Iselin.....	7 41 39	7 46 39	
Raceabouts—21ft. Class—Start, 11:55—Course, 11 Miles.			
Rogue, A. B. Alley.....	4 24 29	4 29 29	
Hobo, T. L. Park.....	3 29 06	3 34 06	
Grasshopper, Harold Pryer.....	4 08 16	4 13 16	
Mavis, G. L. Pirie.....	3 41 57	3 46 57	
Rascal, S. Hopkins.....	3 49 52	3 54 52	
Indian, J. T. Pirie.....	3 42 53	3 47 53	
Crickit, H. Willets.....	4 25 41	4 30 41	
Jolly Tar, S. Slocum.....	3 32 19	3 37 19	
Manhasset Bay One-Design Class—Start, 12:00—Course, 11 Miles.			
Arizona, G. A. Corey.....	5 31 45	5 31 45	
Bob, J. R. Hoyt.....	5 31 16	5 31 16	
Falcon, Stevens and Cole.....	6 00 58	6 00 58	
Lambkin, S. W. Roach.....	5 35 38	5 35 38	
Sloops—25ft. Class—Start, 12:05—Course, 11 Miles.			
Lucille, P. Williams.....	5 38 16	5 33 16	
Chingachcook, E. A. Stevens.....	4 40 56	4 35 56	
Snapper, F. H. Page.....	4 24 27	4 19 27	

The winners were: Weetamoe, Eelin, Aspirant, Anoatok, Dorothy, Hope, Hobo, Bob and Snapper.

Tuesday, July 7.

On Tuesday the launch, gig and dinghy races were held. There was also a match race between Effort and Challenge, the two 43-footers. These boats were to sail twice over a triangular course, but the race was called off at the end of the first round owing to the lack of breeze. The race will be resailed after the New York Y. C. cruise.

The day was an ideal one for the small boat races, there being but little wind and the water was quite smooth. The launch belonging to the schooner Atlantic won the race for boats over 21ft. long. The gig belonging to the schooner Sachem won the race for the Hen and Chickens colors. The schooner Crusader's gig won the Dauntless colors, and the yawl Paladin's gig won the Executive colors. The summaries:

Series A—Naphtha Launches—Course, 2 Miles.			
	Start.	Finish.	Elapsed.
Corona.....	2 15 12	2 47 03	31 51

Clara.....	4 27 13	18 55	
Dolauradora.....	4 27 31	19 13	

Dingies—For "Execution" Colors—Course, 1 Mile.			
Paladin.....	4 40 49	10 08	
Mira.....	4 40 51	10 10	
Cornelia.....	4 40 49	10 18	
Corona.....	4 41 27	10 46	
Rodona.....	4 41 43	10 58	
Rosalind.....	4 41 45	11 04	
Trochilus.....	4 42 48	12 07	
Katrina.....	4 42 54	12 13	
Whitby.....	4 42 56	12 15	
Isolde.....	4 43 15	12 34	
Mimosa II.....	4 43 31	12 50	
Flosshilde.....	4 43 53	10 58	

The winners were: Atlantic, Dolauradora, Doris, Paladin, Sachem, Crusader and Paladin.

There were also swimming and tub races and tilting contests.

Wednesday, July 9.

The race on Wednesday was marked by a fairly good list of starters, but the breeze was almost too light to make the racing interesting. The breeze was so light at 11:30 that the regatta committee decided to postpone the start until noon. At this time there was a little air from the west, but soon worked around to W. S. W., and remained in that quarter the balance of the day. The boats in class I. sailed twice over a fifteen-mile triangle. The rest of the boats covered an eleven-mile triangle, the largest of them going around twice.

Weetamoe got the start and again defeated Neola handily. The latter boat had trouble with her steering gear and was forced to substitute a tiller for a wheel. The bronze boats Weetamoe and Neola had no trouble beating the English boats Isolde and Eelin in the light breeze, and Eelin beat Isolde.

Effort, sailed by Mr. Hazen Morse, had things her own way as the only competitor that is at all dangerous, Challenge broke her throat halliards and withdrew.

Owing to her sails being in bad shape Aspirant came very near losing her first race to Mimosa II. The Crown-inshield production did better than the Gardner boat on all points of sailing on the first round, and she had a lead of 2m. 5s. On the second round some changes were made in Aspirant's sails under direction of Mr. Wm. Gardner, her designer, who was on board, and she then outsailed Mimosa II. handily. The first leg of the course was a spinnaker run, and Aspirant cut down Mimosa's lead and established an overlap before reaching the mark. Mimosa II. had to give room at the mark, and Aspirant rounded inside of her and from that time on she continued to get away from her, and finished a winner by 3m. 58s.

In class M Anoatok scored another decisive victory. She beat Spasm, the second boat, by 12m. 33s. Leda was beaten by Breeze, one of the Newport special thirties.

Tern beat Sakana, her only rival in the yawl class, with the greatest ease.

Alert had matters all her own way in class N, and she beat Flosshilde without difficulty.

Hope again took a first prize in the C. F. Herreshoff one-design class. Lively was second and Spoonbill was last.

In class P. Chingachcook finished first by nearly 8m., but lost on corrected time to Snapper.

Dorothy proved too smart for Houri in the Larchmont 21ft. one-design class and won easily.

Eight boats started in the raceabout class, and all finished. Hobo finished an easy winner with Jolly Tar second.

There were only two starters in class Q, and Montauk beat Gazabo by 12m. 12s.

Three of the New Rochelle one-design boats came to the line. Miss Anne Bavier's Ace beat Knave 5m. 27s.

Bab beat the other three competitors in the Manhasset Bay one-design class.

Pandora was alone in class R, and she sailed over the course alone.

Gosling beat Scud in the Hempstead Harbor class, and Ripple beat Arrow in the Horseshoe Harbor one-design class.

Six of the Pelham Bay Larks started and all but one finished. Flirt beat Skidoo 1m. 40s. These boats covered a five and one-half mile triangle. The summaries:

Sloops—Class I, 60 to 70ft. Racing Length—Start, 12:05—Course, 30 Miles.

The winners were: Weetamoe, Eelin, Effort, Aspirant, Anoatok, Tern, Alert, Hope, Dorothy, Snapper, Hobo, Montauk, Pandora (sail over), Ace, Bab, Gosling, Ripple and Flirt.

Thursday, July 9.

The racing on Thursday proved to be most unsatisfactory and the boats that won were in almost every instance favored by the wind, what little there was of it. The race committee was forced to stop the boats at the end of the first round, as there was not air enough to send the boats around twice. The start was delayed an hour, and at 12:30 the boats were sent away. At this time there was a very light W. N. W. breeze, but this dropped when the boats were on the second leg of the course, and from that time on the boats worked their way around the course by the aid of light puffs that drew off the Long Island shore.

The course was from the starting line to and around the spar buoy off Parsonage Point, thence to and around the spar buoy off Red Springs Point and back to the finish line.

Weetamoe got the start in her class and she finally beat Neola by 14m. 11s. Neola and Eelin got pocketed under the Long Island shore when near the Red Spring mark, and were a very long time in rounding.

Challenge won in her class, beating Effort 4m. 36s., but Mr. Hazen Morse, who sailed Effort, protested Challenge for fouling Effort when nearing the Red Spring buoy. The race committee disqualified Challenge.

Aspirant, splendidly handled, again distinguished herself not only by beating Mimosa II., but by finishing ahead of every boat in the fleet that sailed the ten and three-quarter mile triangle.

Anoatok beat Spasm by only 1m. 55s., but the latter boat had the best of the luck.

Flosshilde had only one competitor in class N, and she gets the race, as Little Peter withdrew.

The three boats in the C. F. Herreshoff one-design class were the last boats to finish. Lively won easily.

Snapper gave Chingachcook a good beating in class P. Houri fouled Dorothy at the start in the Larchmont 21ft. one-design class, and the former boat was disqualified. Adelaide won in this class.

Grasshopper got her first race in the raceabout class. She beat Indian, the second boat, 11m. 42s. Grasshopper was the first boat to finish among those who covered the short course.

Lambkin won in the Manhasset Bay one-design class, beating Bab 1m. 23s. The summary:

Manhasset Bay one-design class, beating Bab 1m. 23s. The summary:			
Class, I, 60 to 70ft. Racing Length—Start, 12:35—Course, 21½ Miles.			
Weetamoe, H. F. Lippitt	4 46 46	4 11 46

Rogue, A. B. Alley	3 16 55	2 21 55	
Manhasset Bay One-Design Class—Start, 1 O'Clock—Course, 5¾ Miles.			
Bab, J. R. Hoyt	4 19 03	3 19 03	
Arizona, G. A. Correy	4 19 06	3 19 06	
Lambkin, S. W. Roach	4 17 37	3 17 37	
Falcon, Stevens and Cole	4 33 03	3 33 03	

Friday, July 10.

The race on Friday proved to be the best of the series. The race committee postponed the start a half an hour and when the boats were sent away just after noon there was a good sailing breeze from the S. W. which held pretty true all through the race. The boats in class I. sailed twice over a fifteen-mile triangle, and the rest of the boats covered an eleven-mile triangle, the bigger classes covering it twice.

At 12:05 Weetamoc, Neola, Eelin and Isolde started, and they crossed in the order named, all within ten seconds of one another. Weetamoc had the best of the start, and again beat Neola by 4m. Eelin scored another victory over Isolde, winning by 8m. 55s.

Effort made a remarkable showing, not only beating all the boats in her class easily, but also beating Mimosa II. by 11s.

Aspirant, sailed by one of her owners, Mr. Addison Hanan, again defeated Mimosa II. by 1m. 29s. This was the closest and most conclusive race that these two boats have sailed, and Mimosa was fairly beaten. Mimosa II. moved very fast, and pushed Aspirant hard for first place, and she crossed the Gardner boat's bow once on the windward work. Effort made an excellent showing against these two new boats, but it was mainly because she held well in under the Long Island shore, where she got a stronger and more favorable breeze.

Anoatok defeated Spasm and Breeze again. The showing this boat is making is really remarkable.

Fine racing was seen in the raceabout class, and only nine minutes separated the first and last boat at the finish. Cricket worked into first place after the start and led the fleet at the end of the first round. She won 29s. from Hobo, the second boat.

Dorothy defeated Hourly and Adelaide again. Flosshilde had a special race on with Little Peter, but the latter boat carried away her jib stay and withdrew.

Hope led the other two boats in the C. F. Herreshoff one-design class at the end of the first round, but on the second round Lively worked into first place on the windward work and finished a winner. Spoonbill also passed Hope and finished in second place.

In the Manhasset Bay one-design class Bab beat Arizona 5m. 18s. The summary:

Slops—Class I—60 to 70ft. Racing Length—Start, 12:05—Course, 30 Miles.		
Weetamoc, H. F. Lippitt	5 05 29	5 00 29
Neola, G. M. Pyncheon	5 09 29	5 04 29
Eelin, F. L. Rodewald	5 23 02	5 18 02
Isolde, F. M. Hoyt	5 31 57	5 26 57
Sloops, Class L—36 to 43ft. Racing Length—Start, 12:10—Course, 22 Miles.		
Effort, F. M. Smith	4 03 27	3 56 27
Challenge, W. T. Foote	4 21 58	4 11 58
Mira, C. L. Poor	4 24 46	4 14 46
Hebe, H. B. Smithers	4 25 55	4 16 55
Special, Class L—Start, 12:10—Course, 22 Miles.		
Aspirant, A. W. Hanan	4 05 09	3 55 09
Mimosa II., T. L. Park	4 06 38	3 56 38
Sloops, Class M—30 to 36ft. Racing Length—Start, 12:15—Course, 22 Miles.		
Anoatok, W. G. Brokaw	5 00 22	4 45 22
Spasm, E. Berre King	5 08 30	4 53 30
Breeze, W. G. Roelker, Jr.	5 10 38	4 55 38
Sloops, Class N—25 to 30ft. Racing Length—Start, 12:15—Course, 22 Miles.

Little Peter, F. M. Weeks	Did not finish.	
Charles Herreshoff One-Design Class—Start, 12:15—Course, 11 Miles.		
Hope, A. Iselin	5 38 16	5 23 16
Lively, C. O'D. Iselin	5 31 44	5 16 44
Spoonbill, August Belmont, Jr.	5 36 22	5 21 22
Raceabout Class—Start, 12:25—Course, 11 Miles.		
Hobo, T. L. Park	3 23 56	2 58 56
Cricket, H. Willetts	3 23 27	2 58 27
Mavis, G. L. Pirie	3 32 33	3 07 33
Indian, A. Pirie	3 27 59	3 02 59
Rascal, S. Hopkins	3 25 10	3 00 10
Grasshopper, H. Pryer	3 31 32	3 06 32
Jolly Tar, S. Howland	3 27 03	3 02 03
Kogue, A. B. Alley	3 29 13	3 04 13
Larchmont 21ft. One-Design Class—Start, 12:20—Course, 11 Miles.		
Dorothy, L. D. Spence	3 35 01	3 15 01
Adelaide, J. J. Dwyer	3 37 36	3 17 36
Hourly, J. M. Esser	3 37 49	3 17 49
Manhasset Bay Y. C. One-Design Class—Start, 12:30—Course, 11 Miles.		
Bab, J. R. Hoyt	4 16 46	3 46 46
Arizona, G. A. Corry	4 22 04	3 52 04
Lambkin, S. W. Roach	4 25 13	3 55 13
Falcon, Stevens and Cole	Did not finish.	

The winners were: Weetamoc, Eelin, Effort, Aspirant, Anoatok, Flosshilde, Lively, Cricket, Dorothy and Bab.

Saturday, July 11.

A calm and a thunder squall spoiled the racing on Saturday. There was a fine list of starters, some sixty-two boats coming to the line. The preparatory was given promptly at 11:30 and at that time there was a fresh N. W. breeze blowing, and there was good promise for a fine day's sport. The course for the larger boats was to and around the buoy off Parsonage Point, thence to and around the buoy of Red Springs Point and back to the starting line, to be covered twice.

Neola crossed the line before the signal and was disqualified. Her owner was very much disappointed, as he beat Weetamoc for the first time this season. Weetamoc gets the race, as she beat Eelin and Isolde, and also the series prize offered by Commodore Adams.

Eelin and Isolde had a hot race on the last leg of the second round, and after luffing way off their course, Eelin crossed the line a winner by a very narrow margin. Eelin also wins the series prize.

In the 43ft. class, Effort won again, beating Challenge 7m. 28s. Effort also gets the series prize.

Aspirant had Mimosa II. so badly beaten that the latter boat withdrew before the squall struck. Aspirant was two legs ahead of Mimosa II. when she withdrew. This makes six wins for Aspirant out of six starts—a very clean record for a new boat. Aspirant came very near colliding with Isolde during the height of the squall. Isolde came driving down for the mark at Red Springs, and Aspirant was under her lee. At a critical moment Aspirant's tiller cracked and nearly broke in two. Isolde kept clear, and as soon as she blanketed Aspirant the latter boat was able to keep off and go clear.

Anoatok won her sixth consecutive victory in her class. She beat Spasm 36m. 30s. Leda withdrew.

Sakana won in the M class for yawls. Tern withdrew. In class N Alert beat Flosshilde 28m. 52s. Little Peter did not finish.

Hope won in the C. F. Herreshoff one-design class by

4m. 21s. from Lively. This gives Hope the series prize.

In class P, Spinster won, beating Lucille 2m. 52s. Chingachgook did not finish.

Hourly got a big jump on the other two boats in her class and finished over an hour ahead of them.

Jolly Roger won in the raceabout class. The raceabout Indian was dismasted during the squall, and a man tumbled overboard from Hobo, but he was picked up by the raceabout Cricket, on which boat he finished the race. Grasshopper was disqualified.

Lambkin won in the Manhasset Bay one-design class. Bab was leading all the way to the finish, but when the wind dropped the tide swept her away from the starting line, and Lambkin was able to cross and get first prize.

In the New Rochelle one-design class, Caper beat Ace 4m. 51s. Knave and Deuce were disqualified.

Cricket won in class R, beating Plover and Pandora easily.

Scud beat Gosling in the Hempstead Harbor one-design class. Why Not capsized in the squall, and her crew was picked up by the yawl Andax. Wif Waf did not finish.

Arrow beat Ripple in the Horseshoe Harbor one-design class, and Streak won in the Pelham Bay Lark class. Louise Bell had a sail over in class W. The summary:

Class I—60 to 70ft. Racing Length—Course, 2 1/2 Miles—Start, 11:35.		Finish.	Elapsed.
Weetamoc, H. F. Lippitt	4 36 03	5 01 03

Louise Bell, J. M. Williams	2 20 05	2 10 05	
*Started before the gun.			

The winners were: Weetamoc, Eelin, Effort, Aspirant, Anoatok, Sakana, Alert, Hope, Spinster, Hourly, Jolly Roger, Lambkin, Caper, Cricket, Scud, Arrow, Streak and Louise Bell (sail over).

Duxbury Y. C.

DUXBURY, MASS.,
Saturday, July 11.

A club race of the Duxbury Y. C. was sailed Saturday, July 11, in a fluky E. breeze. In the 18ft. knockabouts Aspirinquin II. and Wink led on the first leg. Aspirinquin II. was passed by both Kittiwake and Miladi II., but on the last leg Aspirinquin II. went up again and crossed the finish line in the lead. As You Like It had an easy win in the handicap class. The summary:

18ft. Knockabouts.		Elapsed.
Aspirinquin II., C. M. Foster	1 17 00	
Miladi II., Russell Adams	1 18 02	
Osprey, G. Train	1 19 10	
Kittiwake, H. M. Jones	1 19 12	
Wink, L. B. Goodspeed	1 21 30	
Handicaps.		
As You Like It, W. T. Whitman	1 16 35	
Aureolus, H. Kellogg	1 20 48	
Solitaire, Dr. Amesbury	1 23 30	

Bensonhurst Y. C.

GRAVESEND BAY, LONG ISLAND,
Saturday, July 11.

Twenty-eight craft started and finished the first open regatta of the Bensonhurst Y. C., held on the afternoon of Saturday, July 11. A race of the Y. R. A. of Gravesend Bay, originally scheduled for that day, was postponed until July 18 because of the absence of Brooklyn Y. C. craft on the annual cruise of that organization.

The start of the race was to be at 3 o'clock. At this hour, however, a bad thunder and rain squall broke over the bay and a postponement was necessary until this had spent itself. The preparatory signal was sounded at 4:15. Reverse courses were to be sailed, leaving all marks on the port hand.

Classes M and N got away at 4:18, and the others at intervals of three minutes. The breeze at the start was very light from the S. W. A strong flood tide was running, which greatly handicapped those boats to the leeward of the line in making the start.

Many crossed long after the signal for their class. The breeze fell shortly after the start, however, and returning carried the sternmost boats up toward the leaders. In the light wind a practical knowledge of the local tides was of great benefit.

Classes M and N went the outside Association course. They had a broad reach to Craven Shoal buoy, close hauled work to Red Buoy No. 2 off Coney Island Point, and a spinnaker run home. The rest of the fleet covering the inside journey had a broad reach to the mark off the Marine and Field Club, a reach to the Fort Hamilton buoy, another reach to the stake boat off Sea Gate, and a run home.

It was the original intention to have all classes cover their respective courses twice. The light wind, however, made it advisable to end the journey of classes M and N at the end of the first round. Vivian II. led Bobtail at the finish of the 30-footers by 18s., the latter winning on time allowance. Vivian II. led Bagheera 2m. 35s., and Marion 23m. 3s.

On the second round of the inside course the smaller boats had a better breeze, and faster times were possible. In most instances, however, the order in which the boats found themselves after the calm of the early stages of the race, was the one in which they ended the contest.

The yawl Kate was 12m. 28s. ahead of Caribou at the finish. Caribou was sailing her first race under yawl rig. Kate led Zara 4m. 51s. Cockatoo led Vagabond 3m. 20s., Karma 5m. 57s., Corona 12m. 32s.

Wraith led Mary (ex-Wink) 2m. 52s., Eileen 9m. 4s. Step Lively II. led Rosalie 16m. 50s. Sand Piper, a newcomer in Gravesend Bay, led Apukwa II. 3m. 44s., Pickinny 23m. 23s. Martha M. led Rascal 2m. 45s. Lelia B. led Ruth 10m. 14s. Esperance led Stinger 8m. 17s. Kelpie 1m. 45s., Vixen 17m. 36s. The summary:

Sloops—Class M—Start, 4:18.		Finish.	Elapsed.
Dorothy, C. L. Dinges	5 53 17	1 35 17	
Sloops—Class N—Start, 4:18.			
Vivian II., S. E. Vernon	5 48 20	1 30 20

Catboats—Class W—Start, 4:33.			
Lelia B., J. B. Barnes	6 49 04	2 16 04	
Ruth, W. F. Remney	6 59 18	2 26 18	
Marine and Field Class—Start, 4:36.			
Esperance, T. A. Hamilton	6 36 55	2 00 55	
Stinger, A. P. Clapp	6 45 12	2 09 12	
Kelpie, W. K. Brown	6 48 40	2 12 40	
Vixen, D. J. Mahoney	6 54 31	2 18 31	

The winners were: Bobtail, Cockatoo, Wraith, Step Lively II., Martha M., Lelia B., and Esperance. Other winners to be determined when time allowances are figured out; Dorothy scored a sail over.

Portsmouth Y. C.

PORTSMOUTH, N. H.,
Saturday, July 4.

The annual race of the Portsmouth Y. C. was sailed off the lower harbor on Saturday, July 4, in a whole-sail southeast breeze. Solus won in the first class and Echo in the second class. The summary:

First Class.		Start.	Finish.	Elapsed.
Æolus, Holman	10 54 50	12 28 35	1 33 45	
Nixey, Colby.....	10 54 20	12 31 12	1 36 52	
Jeannett, Frazier.....	10 54 02	12 32 10	1 38 08	
Adlofid, Humphreys	10 55 10	12 39 29	1 44 20

Myth, Hennessey	10 59 45	12 41 11	1 41 26	
Molly, Montgomery.....	10 39 11	Did not finish.		

The Canada's Cup Defender.

TORONTO, July 11.—Commodore Æmilius Jarvis has practically taken charge of Strathcona, and from now on preparations for the great international contest will be under his personal direction.

In securing the services of Mr. Jarvis, both the Royal Canadian Y. C. and Mr. Norman Macrae, the patriotic owner of Strathcona, are to be congratulated. The defense of the cup is now in the best possible hands. Mr. Jarvis is the best yacht skipper, professional or amateur, that Lake Ontario or the chain of lakes has produced. His experience ranges from Seavanhaka cup skimming fishes to deep draft cutters like Strathcona or Merrythought. Mr. Jarvis won the cup originally with Canada at Toledo in 1896. In 1899 he defended it with Beaver and lost, owing to a succession of light weather races. The same circumstance was in his favor, however, in 1901, when he brought back the cup from Chicago with Invader.

Commodore Jarvis started to familiarize himself with his latest craft this week. Strathcona has been well sailed and brought up to racing pitch by Mr. Norman Macrae and Mr. G. E. Macrae, his brother, an experienced racing yachtsman. Mr. Jarvis' work is not so extensive as on some former occasions, though at the same time there is always room for alterations and improvement, and the whole period, prior to the first race on the eighth of August, will be spent in bringing the defender up to her best possible sailing trim.

Strathcona proved plenty stiff enough when she first donned her whole suit of canvas, but her ballast has been increased. The extra lead was put in for various reasons. She was found to be eighteen inches short on the waterline. This of itself might not have been serious. Strathcona would probably be as fast if she only measured 38ft. 6in. as if she measured 40ft., the limit. But the new yachts are built not under formula but under restrictions. The laws of the modern Medes and Persians, which alter not until the next revision, say that the forty-footer shall have a minimum beam of 12ft. 6in. at the waterline, and nothing less. Strathcona, being a boat of easy bilges and flaring sides, has to come down fully to her calculated waterline before she gets the required beam. Hence the extra ballast.

A ton and a half of lead in pigs was put aboard at Oakville and brought back to Toronto, the whole operation being accomplished the same day. Part of the lead has been cast in patterns to lie alongside the keelson between the frames. Part was left in pig form for trimming purposes. Strathcona's tendency to dip her dolphin striker when off the wind has already been noted in these columns, and it was finally discovered that she was five and a half inches by the head. This was remedied by placing the additional ballast well aft.

Strathcona went on the dry dock on Thursday to scrape and tune up for the Lorne cup race on Saturday. This is the first docking the yacht has received since her launching, and she was naturally rather foul. Before launching her bottom was painted with a thin, hard finished preparation of tar, which has some antifouling qualities and, properly treated, takes a very hard, smooth surface. It has been tried in previous Canada's cup defenders and challengers. The first coat left the grain of the wood showing, although the unevenness was more apparent to the eyes than to the fingers. This coat will be rubbed down until very little of it remains. Then another will be applied, to meet with the same fate, and so on. Docking is what the new boat wants, Mr. Jarvis says, and it is probable that her bottom will be scraped and polished half a dozen times in the next four weeks, so that it will have a good finish for the races.

Mr. Jarvis expected to sail his own boat, Merrythought, in the Lorne cup race. It is a club race, and as such Merrythought should be sailed, on account of the pennant for averages at the end of the season. Other competitors with Strathcona entered in the race for this trophy were Canada, Vreda and Yama. The contest was known as a cruising race. Olcott, N. Y., about sixty miles from Toronto, on the south shore, being the objective.

The defender's white topsides and great freeboard make her look a trifle chunky, and her short topmast increases the impression. It is quite possible, however, that this appearance will be entirely eliminated by the time the races take place. It is a fact worth remembering that no Canadian defender or challenger for the Canada's cup has been white. The original Canada had black topsides and a white bottom. Beaver was black, with a silver stripe at the waterline. Invader went away in that guise, although she was blackleaded to the sheer ribbon when she reached Chicago. It is altogether probable that Strathcona will retain her broad aluminum stripe, and dress herself in black enamel. Or she may be potleaded.

The contest promises to be a whole sail one as far as Canadians are concerned. Strathcona's English mainsail, which is her best, has three lines of reef eyelets but no reef points, and Mr. Jarvis says he is not going to put them in. Points will be carried, of course, for emergencies, but they will be kept in a bag and served out to the reefing crew when necessary.

A hollow mast is ready for Strathcona, but it is not likely she will use it. Her center of gravity is a little too low now, and an effort will be made to get it higher, so that she will list more easily in light breezes.

Strathcona's crew for her trials has been chosen, but the final crew has not been picked. It will consist of nine men, only two, and these sailors before the mast, being professionals.

CHARLES H. SNIDER.

Corinthian Y. C.

MARBLEHEAD, MASS.,
Saturday, July 11.

The second championship race of the Corinthian Y. C. was sailed off Marblehead Saturday, July 11, in a light S. E. breeze. At one time during the race the wind backed to the E., but hauled again and held generally about S. E. When the 25-footers started there was some strength to the breeze, but it flattened later to almost a calm.

There were two starters in the 25ft. class, Chewink III. and Great Haste. Chewink III. was over the starting line first, with Great Haste in the weather berth. Chewink III. gained from the start to the finish, having more than

five minutes to spare at the end of the race. In the 22-footers, Opitsah V. was again first across the starting line, and she led all over the course, although Medric put up a good race. They finished only 26 seconds apart. In the 21ft. class, Dabster had things all to herself, as Ruth withdrew. A shift of wind gave the 18-footers a beat to the first mark. The class went over the starting line well bunched, but Arrow pulled away soon after and led all over the course, finishing nearly to seconds to the good. The contest for second place in this class between Myrmidon and Piccadilly was very close, only one second separating them at the finish. The summary:

25-Footers.		Elapsed.
Chewink III., F. G. Macomber, Jr.	1 50 38
Great Haste, T. K. Lothrop, Jr.	1 56 12
22-Footers.		
Opitsah V., S. H. and H. I. Foster	1 57 15
Medric, Herbert White	1 57 41
Handicap Knockabouts.		
Dabster, F. Skinner, Jr.	2 23 11
Ruth, H. S. Wheelock	Withdrew.
18ft. Knockabouts.		
Arrow, E. A. Boardman	2 21 53
Myrmidon, A. P. Loring	2 31 19
Piccadilly, C. H. W. Foster	2 31 20
Chance, R. Boardman	Withdrew.
Moslem, B. D. Barker	Withdrew.
Milillian II., F. G. Woods	Withdrew.
Rattler, A. D. Irving	Withdrew.
Kalmuck, L. Davis	Withdrew.

Penataquit-Corinthian Y. C.

BAY SHORE, LONG ISLAND,
Saturday, July 11.

There were twenty-one starters in the race given by the Penataquit-Corinthian Y. C., on Saturday, July 11. At the time of the start there was a fresh N. W. breeze, but later in the day the wind worked around to the S. W. A hard thunder squall broke just as the boats were finishing, and it made matters very lively and exciting for a time. The boats in class N sailed their first race for the Lighthouse cup. Flight won the race. Electra, the boat that won the cup last year, was entered but did not start. The boats covered a twelve-mile triangle. The summary follows:

Sloops—Class N—Start, 1:05.			Elapsed.	Corrected.
Flight, Horace Havemeyer	2 26 45	2 26 37	
Arrow, F. P. Macy	2 35 30	2 35 30	
Pinkie, Allan Pinkerton	2 41 36	2 41 04	
Special Sloops—Start, 1:10.				
Cornelia, Thomas J. Cousins	2 45 45	2 42 02	
Mindah, C. O. O'Donough	2 51 38	2 51 38	
Restless, B. F. Loomis	Did not finish.		
Sloops—Class P—Start, 1:10.				
Edice, DeLancey T. Smith	2 50 44	2 50 37	
Elma, A. B. Williams	2 52 27	2 52 27	
Ellen, E. B. Bleeken	Did not finish.		
Class Q—Start, 1:15.				
Dolph, W. K. Dick	2 25 00	
Minnow, J. R. Gibb	2 51 02	
Kinkie, C. E. Coddington	2 49 15	
Decision on corrected time reserved.				
Sloop—Class V—Start, 1:20.				
Grace R., J. T. Ruive	2 20 03	2 11 03	
Lizette, R. Mellick	2 26 10	2 16 52	
Cecil F., E. P. Foster	2 20 11	2 20 11	
Sloops—Class X—Start, 1:25.				
Teaser, Wilbur Ketchum	2 20 12	2 19 14	
Junior, W. H. Dalzell	2 23 18	2 23 18	
Class W—Start, 1:30.				
Dorothy, T. E. Hardenberg	2 20 45	
Scudd, J. V. S. Willey	2 58 36	
Helen, W. H. Wray	3 15 00	
Echo, F. E. Ballard	3 44 40	
Decision on corrected time reserved.				

The winners were Flight, Cornelia, Edice, Grace R., Teaser and Dorothy.

Bar Harbor Y. C.

BAR HARBOR, MAINE,
Saturday, July 11.

Nine of the thirteen new one-design Herreshoff boats started in the race sailed on Saturday, July 11. The boats sailed twice over a six mile triangle. A good breeze held throughout the race, and the boats encountered a sharp S. W. squall during the contest. Joker got the best start, but was followed over the line closely by Bat. Joker led nearly all over the first round, but was finally overtaken by Bat. On the second round Bat increased her lead and won easily, beating Astrild three minutes. Joker was the fourth boat to finish. She had trouble with her balloon jib on the last leg of the first round, and this mishap cost her the race. The summary:

Start, 2:35.			Finish.	Elapsed.
Bat, Edgar Scott	4 22 00	4 22 00	1 47 00
Astrild, H. L. Eno	4 25 00	4 25 00	1 50 00
Curlew, R. H. Gallatin	4 28 30	4 28 30	1 53 30
Joker, H. M. Sears	4 31 30	4 31 30	1 56 30
Ben, A. Y. Steward	4 38 45	4 38 45	2 03 45
Scud, A. J. Cassatt	4 39 20	4 39 20	2 04 20
Pappoose III., V. E. Macy	4 40 00	4 40 00	2 05 00
Kawuna, J. B. Trevelyan	4 41 00	4 41 00	2 06 00
Sara, J. M. Sears	4 41 02	4 41 02	2 06 02

Erie Y. C.

ERIE, Pa.—Editor Forest and Stream:—The first race of the season by the Erie Y. C. was sailed on July 4 at 3 o'clock in the afternoon. Under the new starting rules (at least they are new here) they were required to start from the anchorage with all canvas down, anchors either weighed or shipped; most of them were shipped. The course was a triangle about seven miles in length. The 10-knot breeze. The yachts starting were the Iroquois, Mingo, Girvanto, Marvel, Una, Miriam, Imp, Zephyr, Phyllis, Viking, Kingfisher and Julia.

They finished in the order named, all except the Julia, which ran on a sand bar and staid there. Several others did not get started. Some of them might have done better than the ones that did, had they ran. 1 hour 19m. 17s. was the winner's corrected time.

Starters: E. A. Davis, J. B. Boyd, and J. P. Smart.

The next race will be on Saturday, July 11, and every other Saturday through the season after this. For these races there will be three pennants given, one for 25ft. boats, one for 30ft. and one for 35-footers. We have no longer ones here.

CABIA BLANCO.

Rochester Y. C. and Genesee Y. R. A.

CHARLOTTE, LAKE ERIE,
Saturday, July 4.

On the Fourth of July the Rochester Y. C. and the Genesee Yacht Racing Association held special races off Charlotte. The boats covered a six-mile triangular course, each leg being two miles.

Iris made the best time over the course, and Naomi II. finished only a minute behind Iris. Most of the boats were entered in the races of both clubs and the same classes were sent away at the same time. The summaries follow:

ROCHESTER Y. C.			
25-30-ft. Class—Start 10:30.			
	First Leg.	Second Leg.	Finish.
Iris	10 59 00	11 16 35	11 38 54

Newport Special Thirties.

NEWPORT, RHODE ISLAND,
Tuesday, July 7.

A good whole sail S. W. breeze held throughout the race sailed by the 30-footers on Tuesday. The boats covered a triangular course which was laid out in the bay. Barbara was first over the starting line, but Carolina overtook her on the first leg. Vaquero III. worked into first place on the last leg of the course and finished a winner by the narrow margin of 13s. Carolina protested Vaquero III. for fouling her at the start. The protest was sustained, and the race was given to Carolina. The summary:

Start 3:40.			
	Finish.	Elapsed.	
Vaquero III., Payne Whitney	5 18 38	1 38 38	
Carolina, C. L. F. Robinson	5 18 51	1 38 51	
Barbara, Winthrop Rutherford	5 21 01	1 41 51	

Wednesday, July 8.

The 30-footers covered a twelve-mile triangular course in Wednesday's race. The breeze was strong from the S. W. Vaquero III. led over the line and remained ahead until the last leg, which was a beat to windward. Carolina took the lead on this leg and won by less than a minute. The summary:

Start 3:45.			
	Finish.	Elapsed.	
Carolina, C. L. F. Robinson	5 17 54	1 39 54	
Vaquero III., P. Whitney	5 18 43	1 41 43	
Barbara, W. Rutherford	5 21 37	1 44 37	

Friday, July 10.

The sweepstake race sailed on Friday was won handily by Carolina. The course was from Brenton's Cove to a buoy in Coddington Cove, rounding the Jamestown mark going out and returning. The wind was again strong from the S. W. Carolina was first over the line and was never headed. The summary:

Start 3:56.			
	Finish.	Elapsed.	
Carolina, C. L. F. Robinson	5 21 48	1 40 48	
Barbara, Winthrop Rutherford	5 23 17	1 42 17	
Vaquero III., Payne Whitney	5 24 00	1 43 00	

Saturday, July 11.

Only three of the 30-footers came to the line for Saturday's race. There was a good sailing breeze from the S. W. Vaquero III. led over the line, but she got in a luffing match with Carolina, and while this was going on Barbara worked into the lead and finished a winner by over two minutes. The summary:

Start 3:38.			
	Finish.	Elapsed.	
Barbara, W. Rutherford	5 20 01	1 42 01	
Carolina, C. L. F. Robinson	5 22 17	1 44 17	
Vaquero III., Payne Whitney	5 23 46	1 45 46	

Shelter Island Y. C.

SHELTER ISLAND, LONG ISLAND,
Saturday, July 11.

The second race of the Shelter Island Y. C. was sailed on the afternoon of Saturday, July 11, over courses in Deering Harbor. A light westerly wind blew throughout the contest. Kalmia won a signal victory in class N, defeating Oiseau and Senta. Harp won in the competition for class R craft. In sub class R, Ria carried off the laurels. The summaries follow:

Class N—Sloops—Start 2:10.			
	Finish.	Elapsed.	
Kalmia, G. T. Hollister	4 53 34	2 43 34	
Oiseau, H. L. Maxwell	4 54 06	2 44 06	
Senta, O. E. Lohrke	4 55 59	2 45 59	
Class R—Sloops—Start 2:15.			
Harp, J. N. Lunning	4 07 30	1 52 30	
Iris, G. Piel	4 08 51	1 53 51	
Psi, A. O. Bancker	4 09 40	1 54 40	
San Toy, M. Edson	4 10 18	1 55 18	
Snook, W. W. Becker	4 10 09	1 55 09	
Arrow, G. H. Keim	4 15 39	2 00 39	
Sub Class R—Start 2:15.			
Ria	4 20 02	2 05 02	
Belskin, J. L. Hutchison	4 28 06	2 13 06	
Duchess, Carl Pickardt	4 41 01	2 26 01	

Philadelphia-Corinthian Y. C. Cruise.

The following general orders have been issued by Mr. Charles H. Brock, fleet captain of the Philadelphia-Corinthian Y. C.:

The fleet of the Corinthian Y. C. will rendezvous for the annual cruise at Glen Cove, Long Island, N. Y., on the afternoon of Friday, July 24, 1903.

A meeting of captains will be held on board the flagship at 8:30 P. M.

Prizes have been offered for port to port runs for yachts in cruising trim, and when four or more start, a second prize to be awarded. The commodore has offered a cup to the yacht in each class winning on corrected time the greatest number of runs.

Saturday, July 25—Glen Cove to Oyster Bay.

Sunday, July 26—Fleet to remain at anchor at Oyster Bay.

Monday, July 27—Oyster Bay to Morris Cove.

Tuesday, July 28—Morris Cove to Shelter Island.

Wednesday, July 29—Shelter Island to New London.

Thursday, July 30—Fleet to remain at anchor. Gig and dinghy races for yachts' crews, and races for small boats belonging to yachts of the fleet, will be held in the afternoon. Entries to be made to the fleet captain.

Friday, July 31—New London to Jamestown, R. I.

Saturday, August 1—Disband.

Seawanhaka-Corinthian Y. C.

OYSTER BAY, LONG ISLAND SOUND,

Saturday, July 11.

The one-design 15-footers sailed the fourth race for the Center Island cup on Saturday afternoon, July 11. The boats covered a triangular course, the first leg of which was a reach, the second a beat and the third a reach. Fight boats started and Bobs won by 56s. The breeze was light from the south. The summary:

	Finish.	Elapsed.
Bobs, W. A. W. Stewart.....	6 39 54	2 19 54
Cayenne, Colgate Hoyt.....	6 40 50	2 20 50
Wee Wean, R. L. Cuthbert.....	6 41 47	2 21 47
Imp, H. H. Landon.....	6 42 26	2 22 26
Brownie, R. W. Gibson.....	6 44 54	2 24 54
Fly, W. E. Roosevelt.....	6 47 30	2 27 30
Olita, H. C. Rouse.....	6 48 56	6 48 56
Nit, J. R. Burnet & F. D. Pavey.....	Did not finish.	

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Mr. Hollis Burgess reports the following transfers: Chartered (in conjunction with Gardner & Cox), the 125ft. steam yacht Nydia, owned by F. J. Lisman of New York to Charles N. Shaw of Boston.

Chartered, the 45ft. sloop Hesper, owned by Ralph Forbes of Boston to H. A. de Windt of Chicago.

Sold, the 25ft. sloop Margaret, owned by James L. Paine of Boston to Geo. C. Vaughn of Salem, Mass.

Sold, the 24ft. racing sloop Kit, owned by Com. T. H. McDonald of the Bridgeport Y. C., to H. B. Whit-tier of Boston.

Sold, the 21ft. knockabout Gosling, owned by Louis M. Clark of Dorchester, Mass., to Bancel La Farge of Beverly, Mass.

Sold, the 21ft. knockabout Paloma, owned by J. Malcolm Forbes of Boston to Thos. B. Eaton of Worcester, Mass.

Sold, the raceabout Hazard, owned by Chas. O. Dexter of Hamilton, Ont., to Messrs. C. E. and J. P. Loud of Boston.

Sold, the naphtha launch Enid, owned by Chas. O. Miller of Braintree, Mass., to E. L. Woodard of Norfolk, Va.

Sold, an 18ft. gasoline launch, owned by John O. Bicknell of Weymouth, Mass., to E. B. Holmes, of Hull, Mass.

Sold, the 19ft. catboat Ruby, owned by I. H. Packard of Watertown, Mass., to F. G. Jackson of Cambridge, Mass.

The Associated Press of this city have chartered the steam yacht Chetolah for the Cup Races, through the agency of Stanley M. Seaman. She is to be equipped with a Marconi wireless outfit by the Morse Iron Works, So. Brooklyn, N. Y.

The same office has also sold the auxiliary sloop Marion to Mr. J. H. Fernier, Pavonia Y. C., Jersey City, N. J.

The Regatta Committee of the New York Y. C. have issued the following regarding the steam yacht race for the Lysistrata Cup. The event will take place off Newport on July 24:

"The Lysistrata Cup, Newport, R. I., July 24, 1903.

"A \$2,500 cup, with \$2,500 added for the winner in the first competition.

"A challenge cup presented by former Commodore James Gordon Bennett, N. Y. Y. C., for steam yachts belonging to the New York Y. C., and for steam yachts properly enrolled in any foreign yacht club, and limited to yachts above 150 net tons in size, American yacht measurement (net registered tonnage).

"The course will be triangular, sixty nautical miles in length, starting off Brenton's Reef Lightship.

"The signal for the start will be made at half-past one P. M.

"Entries must be made in writing, addressed to the committee, and will be received at the Newport Station up to three P. M., July 23.

"Detailed sailing directions and chart of the course will be issued later."

The steam yacht White Heather, owned by Mr. Harrison I. Drummond, has been chartered through the agency of Messrs. Tams, Lemoine & Crane to Mr. Edmund Randolph.

At a meeting of the New York Y. C. held on June 25, the following were elected members: Arthur Olatt Howard, John C. Tatum, E. P. McMurtry, George B. Post, Jr., Captain Duncan Kennedy, U. S. N.; Walter S. Gurney, Frederick P. Scudder, Lieutenant Charles P. Nelson, U. S. N.; George Lauder, J. Horace Hard-

ing, John Kensett Olyphant, William Howard Barnard, Buckingham Lockwood, James Douglass Sparkman, Henry B. Lothrop, Clarence E. Burke, Lieutenant Spencer S. Wood, U. S. N.; Frank J. Logan, Leonard Jacob, Jr., William Ross Proctor, Frederick W. Herring, Rev. George Alexander Strong, Lieutenant E. W. Kittelle, U. S. N., and Franklin Q. Brown.

Irondequoit, the challenger for the Canada's Cup, arrived at Charlotte on Saturday, July 11. She will be thoroughly overhauled and put in racing trim at once.

Lloyds' Yacht Register.

FOR twenty-six years Lloyds' Register of British and Foreign Shipping has published the Yacht Register, and it is hardly necessary to say that the work has always been superbly done. The register is issued on May 1, and the volume for 1903 is now ready for delivery. It includes, as usual, the most authoritative information, and is invaluable to all yachtsmen as a work of reference. It contains the names, particulars and characters of yachts classed by the Society; also, in an appendix, a list of the different yacht and sailing clubs and illustrations of their respective flags; an illustrated list of the flags of yachts; an index of signal letters; a list of yachts which have had their names changed; a list of builders and designers with the names of yachts built or designed by them (a most valuable feature of the book); an alphabetical list of the names and addresses of yacht owners, with the clubs to which they belong, and much other important information.

The volume is beautifully bound in green and gold, and we cordially commend it to every American yachtsman. The New York office of Lloyds' Register is at 15 Whitehall street, and their telephone number is 1699 Broad.

Hope's Small Yacht Construction and Rigging.

To the amateur builder who may wish to construct his own boat, or make a successful hobby of small yacht building this book will prove a valuable instructor, and no one with reasonably fair skill in the use of tools and average patience and perseverance in taking this book as a guide need long be without an excellent boat—superior, perhaps, to much of the cheap work turned out by small firms. It contains 177 pages in all, with upward of 30 full-page diagrams and designs showing the progress of construction from the laying of the keel to the final rigging of the sails.

The author's introduction is modest in the extreme, and the reader will find that he rather underestimates the value of a work that must prove interesting even to those who may not design building a boat. He says that the designs shown are taken, not so much as being ideal boats in any way, but chiefly as representing popular types of sailing boats and small yachts now in general use, and suitable for an amateur to build.

Printed on excellent paper, with strong linen binding and a cover pocket for carrying plans, maps, or designs, it can without fear of injury be made a companion of the work shop, where its excellent suggestions about the use and care of tools, its pages on materials, and encouraging and useful hints along the lines of general work may help to fill in a restful hour during the progress of construction.—Claude King in Sports Afield.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First, \$50.00.

Second, \$25.00.

Third, \$15.00.

Fourth and Fifth, \$10.00 each.

Sixth to Eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, N. Y., on or before December 1, 1903.

A. C. A. Racing Regulations.

101 CLARK STREET, Brooklyn, July 8.—*Editor Forest and Stream*: Referring to the proposed changes in the racing regulations of the American Canoe Association, I beg to add to my previous letter that these changes will be submitted to the newly elected members of the Racing Board of the A. C. A., and will be passed upon by them, as well as by the members of the Executive Committee. The Eastern, Northern, and Central Divisions have had their meetings, and the latter has elected Mr. H. M. Stewart, of Rochester, as its representative on the Racing Board. The Western Division will doubtless elect its representative at the forthcoming camp at Ballast Island, and the Atlantic Division will do so at Sugar Island in August.

For the information of Atlantic Division members, I quote letter received from Mr. W. S. Elliott, the giver of the Atlantic Division sailing trophy, as follows: "As I understand the sailing rules of the A. C. A. are to undergo some change, I suggest that they be applied to govern the competition for the Elliott trophy, which was originally donated to the Atlantic Division for competition by members of that Division."

This, in my opinion, renders the race in question open to all classes which are eligible to race for the A. C. A. trophy, and other races.

J. K. HAND,

Chairman Regatta Committee.

New York C. C.

BENSONHURST, L. I.,

Saturday, July 11.

The second record sailing events of the New York Canoe Club were held on the afternoon of Saturday, July 11, over courses on Gravesend Bay. The breeze was so light that the canoes were sent over a one and one-half mile journey but once. The feature of the regatta was the large entry in the class for open sailing canoes. The summaries follow:

Decked Canoes—Start, 4:40.		
	Finish.	Elapsed.
W. H. Fales.....	5 25 20	0 43 20
Canoe Yawls—Start, 4:30.		
H. Fales.....	3 29 55	0 59 55
D. B. Goodsell.....	5 40 00	1 10 00
Open Canoes—Start, 4:37.		
H. R. Steven.....	6 23 35	1 46 35
W. Carmalt.....	6 26 18	1 49 18
R. S. Foster.....	6 27 38	1 50 38
F. A. Plummer.....	6 32 03	1 55 03
E. J. Wright.....	6 34 00	1 57 00
W. Yelland.....	6 41 20	2 04 20
F. Speidel.....	6 43 45	2 06 45
R. D. Bayley.....	6 45 45	2 08 45
W. B. Jennings.....	6 51 40	2 14 40
A. M. Pool.....	Withdrew.	

The winners were H. Fales and H. R. Steven. W. H. Fales scored a sailover.

American Canoe Association.

BROOKLYN, N. Y., June 29.—*Editor Forest and Stream*: I beg to inform you that the following were elected life members of the A. C. A. since last publication: E. H. Barney, Springfield, Mass.; Paul Butler, Lowell, Mass.; Irving Rouce, Rochester, N. Y.; B. I. Rouce, Rochester, N. Y.; C. V. Winne, Albany, N. Y.

ROBERT J. WILKIN,

President Board of Governors A. C. A.

A. C. A. Membership.

The following have been proposed for membership to the Eastern Division of the A. C. A.: Thomas J. Darcey, Boston, Mass.; C. M. Baker, Robert T. Little, Jas. B. Fitch, Manchester, N. H.; Geo. W. Creelman, Alfred B. Hill, Lakeville, Conn.

Rifle Range and Gallery.

The International Rifle Contest.

The Palma trophy returns to America. In the great International rifle contest for its possession, between teams representing the United States, Great Britain, Canada, Norway, France, Australia and Natal, held at Bisley, England, July 11, the United States team achieved a decisive victory. The real contest, so far as a test of skill is concerned, narrowed quickly to the teams of the United States, Great Britain and Canada, which, in turn, narrowed down to the United States and Great Britain, the other teams being so far in the rear toward the close that their defeat was a foregone conclusion.

The totals of the different teams are as follows:

United States.....	1,570
Great Britain.....	1,555
Canada.....	1,518
Australia.....	1,501
Natal.....	1,399
France.....	1,240
Norway.....	1,240

Thus, the United States defeated Great Britain, its closest competitor, by 15 points.

The individual scores of the United States team are as follows:

	800yds.	900yds.	1000yds.	Total.
Sergt. J. H. Keough, 6th Mass.....	73	69	64	206
Corp. C. E. Winder, 6th Ohio.....	71	53	59	193
Lt. K. K. V. Casey, 71st N. Y.....	67	68	60	195
Sergt. Geo. Doyle, 71st N. Y.....	66	66	59	191
Lt. Thos. Holcomb, U. S. M. C.....	66	61	67	194
Pr. Geo. Cook, 1st D. C.....	74	63	68	205
Lt. A. E. Wells, 71st N. Y.....	65	59	68	192
Corp. W. B. Short, 7th N. Y.....	69	66	59	194
Totals.....	551	515	504	1,570

The possible, per man, at each range was 75, or 225 at the three ranges of 800, 900 and 1000 yards.

The conditions were as follows: For the championship of the world: open to the riflemen of all countries; each team to consist of eight men; any military rifle; minimum pull of trigger, 4½ pounds; 800, 900 and 1000 yards, 15 shots per man at each range by each contestant; any position without artificial rest.

The teams shot in two divisions, four men completing their scores before the remaining four began.

The weather conditions at the beginning were a clear light, a strong sunlight, and a calm atmosphere; favorable conditions for good work. The American team was first to finish at the 800 yard range, taking one hour and 15 minutes, well within the time limitation of one hour and three-quarters.

At the finish of the competition at 800 yards the British team was in the lead of all, and three points ahead of its closest competitor, the United States team. The scores of each team at 800 yards were: Great Britain, 554; United States, 551; Canada, 536; Australia, 518; Natal, 513; Norway, 447; France, 441.

The individual scores of the members of the United States team were:

Private George Cook.....	74
Sergeant J. H. Keough.....	73
Corporal C. E. Winder.....	71
Corporal W. B. Short.....	69
Lieutenant K. K. V. Casey.....	67
Sergeant George Doyle.....	66
Lieutenant Thos. Holcombe, Jr.....	66
Lieutenant A. E. Wells.....	65

When the competition began at 900 yards the weather conditions

had become more difficult, a puffy wind having set in, hence correct allowances for it were extremely difficult. All the scores fell off in consequence, yet the United States team shot best, and took the lead over the British team at this range by 11 points. Deducting the 3 points lost by the United States team at 800 yards, this left them with 8 points in the lead.

The scores of the teams at the 900-yard range were: America 515, Great Britain 504, Canada 494, Australia 492, Natal 447, Norway 408, France 404.

The individual scores of the United States team were: Keough 69, Casey 68, Doyle 66, Short 66 Cook 63, Winder 63, Holcombe 61, Wells 69.

The aggregate scores for the two ranges were: America 1066, Great Britain 1058, Canada 1030, Australia 1010, Natal 960, Norway 855, and France 845.

At the 1000-yard range the British team felt hopeful that they would retrieve their lost ground. The general interest was keen. The leaders were so close together that the situation was far from decisive. It was a juncture which required perfect team work. Had one man lost his nerve or skill the lapse would easily have brought defeat. But the nerve, the skill, the guns and the ammunition were all there, working steadily and accurately according to their wont and their reputation.

The teams at the last range drew lots for position, hence any possibility of collusion between shooters and scorers was entirely guarded against. The United States team was on the extreme right next to the Norway team, and on its left successively were the French, Natal and England. The summary of the scores at this range are presented hereinbefore.

The French marksmen explained that they never before had shot on a 1000 yard range and had contested more with a purpose to learn than an expectation to win. In the afternoon there was a large assemblage of spectators, many of whom were distinguished. Ambassador Choate was accompanied by Capt. Stockton, the Naval Attache of the Embassy, Mrs. Choate and Sir Aubrey Fletcher, president of the Army Rifle Association.

The target was that of the National Rifle Association. Its dimensions were 12x6 ft. Bullseye, 3 ft. in diameter. Center, 4½ ft. in diameter. Inner, 6 ft. square, surrounding the bullseye and center. Outer, the remainder of the target, that is to say, the two ends, each 3x6 ft. An inner shot is sometimes designated as a magpie. The values of the different parts of the target are as follows: Bullseye, 5; center, 4; inner or magpie, 3; outer, 2. Thus the maximum possible in 15 shots is 75.

After the conclusion of the match The Palma trophy was presented by Maj.-Gen. Lord Cheylesmore to the American team in the presence of their friends, and he congratulated them freely and heartily on their grand pluck, skill and success. He hoped that an English team would be sent to the United States next year, and that then the attempt would be made to recover it. The sending of the team next year was later definitely and accordingly decided upon.

The victory was celebrated by a banquet, at which the Duke of Cambridge, President of the Army Rifle Association, presided. There was the most cordial fraternizing amongst the guests. The victors were toasted, their rifles and ammunition were praised, and their marksmanship was superlative. In replying for the American team Col. Leslie C. Bruce admitted that it required the best eight men in the United States to win the victory. He expressed his thanks and appreciation of fairness and courtesies extended.

Thus ended another international competition, resulting in success to American skill, firearms, ammunition, and discipline.

With the reawakened interest in long range rifle shooting, with the knowledge that the most earnest effort is essential to the possession of the trophy, and with the excellent team material available in the United States for this great international contest, the capture of it in the future will be a task of greater difficulty than it ever has been in the past.

Last year, 1902, the Palma trophy was contested for at Ottawa, Canada, between three teams, with results as follows: British team, 1,459; American team, 1,447; Canadian team, 1,373.

The history of the Palma trophy holds a conspicuous place in matters of international competition of which the United States are a part. Yet, considering its importance there have been but few contests for it.

The first contest took place at Creedmoor in 1876, Centennial year. Then Scotland, Ireland, Australia, Canada and the United States competed for its possession. The American team was victorious with a total of 3,126 points. The other contestants scored as follows: Ireland, 3,104; Scotland, 3,063; Australia, 3,062; Canada, 2,923. Thirty shots per man at each range then was a condition.

The riflemen of Great Britain made a determined effort to capture it in 1877, at Creedmoor, but were defeated by the score of 3,334 to 3,242. There were in 1878 some differences of opinion concerning the trophy between the team of 1877 and the directors of the National Rifle Association, to determine which the team shot a walkover match, rather hurried in its preliminary arrangements and abrupt in its conclusion. A storm interrupted the walkover. C. E. Dwight had three shots at the 1000 yards unfinished owing to a disabled rifle, and H. T. Rockwell had 14 unfinished owing to the interposition of the severe storm. The Palma trophy then for many years remained in possession of the N. R. A. unchallenged. After a time it was deposited in the Museum of Military Service at Governor's Island, where it remained till the recent American-Spanish war. It was then stored in New York City. In 1900 the United States team had another walkover, thirty shots per man. Score, 2,755. In 1901, at Sea Girt, teams of the United States and Canada contested for it under changed conditions. The scores, 15 shots per man, were: Canada, 1,522; United States, 1,494.

Franco-American Revolver Match.

As mentioned in FOREST AND STREAM last week the complete scores of the French team were tardy in arriving. The complete scores are herewith presented:

M. Louvier, Paris, 496 points; M. Recocq, Paris, 502; M. Fen-gray, Paris, 509; M. Sartori, Paris, 462; M. Balme, Paris, 469; M. Caurette, Ham, 502; M. Dufloy, Marseilles, 541; M. Molinie Paget, Dieppe, 562; Captain Chauchat, Versailles, 524; Commandant Py, Saint Omer, 542; Captain Moreaux, Rennes, 629; Comte de Castellajae, Libourne, 547; Adjudant Paroche, Rennes, 466; M. Keller Korian, Lyons, 522; M. Depassis, Lyons, 503; total 7,640.

The totals were: Americans, 7,859; French, 7,640. Thus the American team won by a margin of 249 points.

Cincinnati Rifle Association.

CINCINNATI, O.—At the annual election on July 5, the officers of the preceding year were re-elected unanimously. The list follows: President, C. H. Roberts; Vice-President, J. Strickmeier; Secretary, A. Drube; Treasurer, H. H. Uckotter; Captain, Mat. Gindele; Lieutenant, L. O. Odell.

At the regular meeting of this Association on June 21, the following scores were made. As the majority of the shooters were attending the St. Louis tournament, the attendance was slim:

Roberts223 217 215 212 206
Strickmeier219 218 217 215 215

At the July 5 meeting a larger number participated, M. Gindele being champion for the day with 224. Mr. Payne was supposed to score 235, according to the dream of one of the members, but it failed to materialize. Conditions, 200yds., offhand, German ring target:

	224	215	214	211	211	Honor.
Gindele	224	215	214	211	211	61
Payne	222	217	216	212	210	65
Roberts	222	213	213	208	203	57
Nestler	217	211	210	208	205	60
Lux	219	200	198	198	196	65
Hofman	215	219	208	205	201	57
Odell	207	206	206	196	192	49
Bruns	205	204	195	192	185	53
Freitag	202	200	199	198	193	56
Hofer	200	196	196	188	187	50
Trounstone	197	194	180	168	167	46
Drube	197	187	186	161

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

July 15.—Charlottesville, Va.—Shoot of the University of Virginia. G. L. Bruftey, Sec'y.

July 18.—Chicago, Ill., Gun Club's tournament. A. A. Walters, Sec'y.

July 20-22.—Winnipeg, Can.—Seventh annual trapshooting tournament of the Winnipeg Industrial Exhibition Association. F. W. Heubach, Gen'l Mgr.

*July 21-22.—Beaver Falls, Pa., Gun Club's tournament. W. R. Keefer, Sec'y.

July 22.—Carlstadt, N. J.—Live-bird shoot on Riverside Shooting grounds. Hackensack River Bridge and Paterson Plank Road. L. H. Schortemeier, Sec'y, 201 Pearl street, New York.

July 22-23.—Indianapolis, Ind.—Limited Gun Club midsummer amateur target tournament. Bert B. Adams, Sec'y.

July 28-29.—Shamokin, Pa.—Shamokin Gun Club target tournament. S. C. Yocum, Sec'y.

July 28-29.—Charlotte, N. C., Gun Club two-day target tournament. A. Burwell, Jr., Sec'y.

July 30-Aug. 1.—La Crosse, Wis.—The Interstate Association's tournament, under the auspices of the La Crosse and Viroqua gun clubs. John M. Moore, sec'y.

Aug. 5-6.—Marshalltown, Ia., Gun Club two-day tournament.

Aug. 5-6.—Millport, Pa.—Oswayo Valley Rod and Gun Club's two-day tournament. M. S. Dodge, Sec'y.

*Aug. 5-6.—Brownsville, Pa., Rod and Gun Club's tournament.

Aug. 12-13.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selember, Sec'y.

Aug. 12-15.—Toronto, Ont.—Annual tournament of the Dominion Trapshooting and Game Protective Association. A. W. Throop, Sec'y-Treas., Ottawa, Can.

Aug. 18-20.—Grand Rapids, Mich.—Second annual target tournament of the Consolidated Sportsmen's Association of Grand Rapids; \$1,000 added. A. B. Richmond, Sec'y.

Aug. 19-20.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selember, Sec'y.

Aug. 18-21.—Ocean City, Md.—J. R. Malone's ninth annual summer tournament; open to all; \$100 added money. J. R. Malone, manager, 2671 Pennsylvania avenue, Baltimore.

*Aug. 19-20.—Millvale, Pa., Gun Club's tournament. Wm. Bussler, Sec'y.

Aug. 26-27.—New Bethlehem, Pa.—Crescent Gun Club's annual tournament. Dr. R. E. Dinger, Mgr.

Aug. 25-28.—Lake Okoboji, Ia.—Annual Indian tournament. Frank C. Riehl, Chief Scribe.

*Sept. 1-2.—Irwin, Pa., Gun Club's tournament. John Withero, Sec'y.

Saturdays.—Chicago.—Garfield Gun Club; grounds W. Fifty-second avenue and Monroe street. Dr. J. W. Meek, Sec'y.

*Member of Western Pennsylvania Trapshooters' League. Chas. G. Grubb, Sec'y, 607 Wood street, Pittsburg.

**Members Southern Trapshooters' Game and Fish Protective Association. J. J. Bradfield, Sec'y, Vicksburg, Miss.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Marshalltown, Ia., Gun Club has fixed upon August 5 and 6 for a two-days' tournament.

Messrs. Whitney and Milner have fixed upon Oct. 1-2 for a tournament at Des Moines, Ia.

Mr. C. G. Blandford informs us that the Ossining Gun Club, of which he is captain, will hold its annual shoot on Labor Day.

The next annual shoot of the Arkansas State Sportsmen's Association will be held at Little Rock. Non-residents may shoot for targets only.

The Dover, N. H., Sportsmen's Association have announced Sept. 30 as the date for their annual field day. Mr. D. W. Hallam is the secretary.

The Secretary, E. J. Loughlin, writes us that "the Riverside Gun Club of Utica, N. Y., claims the date Sept. 7, Labor Day, for an all-day target tournament."

At the North Dakota Sportsmen's Association tournament, July 6 and 7, Mr. C. Parker, of Minot, won the State championship. Minot was fixed upon for the next year's State tournament.

Mr. Chas. G. Grubb, Pittsburg, Pa., writes us as follows: "Kindly take notice that the tournament advertised to take place July 21 and 22, at Beaver Falls, Pa., has been canceled and will either be held later in th season or not at all."

Mr. Dale Bumstead, of Denver, Colo., representative of the Lafin & Rand Powder Co., was a visitor in New York last week. He journeyed homeward last Saturday, after passing a few pleasant hours with two of Lafin & Rand's demure young men, Messrs. J. T. Skelly and W. J. Lyon.

Secretary M. S. Dodge, of Millport, Pa., writes us that "the Oswayo Valley Rod and Gun Club will hold a two-day tournament at inanimate targets, Aug. 5 and 6. The programme consists of 185 targets each day, with \$18.50 entrance money. Thirty dollars will be given in average money each day."

At the Interstate Association tournament, given under the auspices of the Huntsville, Ala., Gun Club, July 8 and 9, of the professionals, Mr. Chas. G. Spencer, 172 out of 185, was high gun on the first day. Baker with 164, was second, and Heikes and Lawrence tied on 163 for third. The amateur high averages were: Baker 88.8, Frazer 85.9, Newman 83.8. On the second day Heikes was first with 177, Baker second, 172; Spencer third, 169. For the two days, Spencer 341, Heikes 340, Baker 336.

The programme of the two-day tournament, to be held at Shamokin, Pa., on July 28 and 29, provides fifteen events each day, two of which are extra on the first day and one on the second day. All the events are at 10 and 15 targets, alternately, excepting No. 7, on the first day, which is a team contest at 25 targets. Targets, 2 cents. A magautrap will be used. Manufacturers' agents, targets only. Guns and ammunition forwarded to Dr. A. B. Longshore will be delivered free on the ground. Mr. S. C. Yocum is the secretary.

Mr. James R. Malone, 2671 Pennsylvania avenue, Baltimore, Md., has fixed upon August 18-21 for his ninth annual summer tournament, open to all. Added money, \$100. Concerning it Mr. Malone informs us as follows: "Two days will be devoted to target shooting, one day to live-bird shooting, and one day to beach-bird shooting. A yachting party has been arranged for a trip to Chincoteague Island, about 30 miles below Ocean City, where there is ample opportunity to enjoy bay bird shooting—yellowleg plover, eurlaw, willet and other species of bay birds.

The programme of the Limited Gun Club midsummer amateur target tournament, fixed to take place on July 22-23, at Indianapolis, Ind., provides twelve events each day, a total of 200 targets, \$20 entrance, subdivided into 10, 15 and 20 target events; \$1, \$1.50 and \$2 entrance. Targets, 2 cents. Moneys divided 40, 30, 20 and 10. Manufacturers' agents invited to shoot for targets only. Make shipments to the secretary, B. B. Adams, care Lehman's Transfer Co. Shooting commences at 9 o'clock. Lunch served on the grounds. A feature of each day will be the contest between C. O. Le Compte, of Eminence, Ky., and H. M. Clark, of Wabash, Ind.

The Nashville American states "it has been decided by the Hermitage Gun Club that on the third Saturday in July there will be a prize shoot in which all gun clubs in this neighborhood will be invited to participate. Among the clubs to be invited are those of Gallatin, Franklin, Ewell Station, Bowling Green, Huntsville, Columbia and Hopkinsville. Numerous merchandise prizes are to be offered for the winners, and in addition a loving cup will be offered by the Hermitage Gun Club for the marksman making the highest score. It is the intention to make this a notable shoot, as it will bring together many of Tennessee's most skillful marksmen."

The programme of the Charlotte, N. C., Gun Club tournament, fixed to take place on July 28 and 29, at Latta Park, has like events each day, five at 15, five at 20 and one at 25 targets, entrance based on ten cents per target. Added money each day, \$100 targets 2 cents. Manufacturers' agents may shoot for targets only. Moneys divided on the percentage system, 40, 30, 20 and 10 per cent. A silver trophy will be presented to high average man each day. Guns and ammunition, prepaid and marked in owner's name, forwarded to A. Burwell, Jr., Secretary, Charlotte, N. C., will be delivered on the grounds free of charge. Shooting will commence at 9 o'clock each day. Two magautraps will serve for a battery. The members of the handicap committee are: Col. Thomas Martin, Bluffton, S. C.; Dr. J. S. Johnson, Raleigh, N. C.; Dr. F. C. Wilson, Savannah, Ga.; Messrs. F. Stearns, Richmond, Va.; and D. H. McCullough, Charlotte, N. C. The following is of special importance to visitors: "Special railroad rates, one and one-third fare on the certificate plan, from all points south of the Potomac and Ohio Rivers, and east of the Mississippi river, including Washington, Cincinnati and St. Louis. Write Secretary A. Burwell, Jr., advising him of your intention to be present at the tournament and he will send you certificate to use; otherwise see that agent from whom you purchase ticket issues you the customary certificate." Shooters attending this tournament can easily make it convenient to attend the target and live-bird shoot at Anderson, S. C., first week in August.

BERNARD WATERS.

The Wanderers have arranged dates as follows: Rutherford, N. J., July 11; Brooklyn, July, 18; Frog Inn, on Jamaica Bay, July 25; South Side Gun Club, of Newark, N. J., Aug. 1. All will be for the L. C. Smith gun, except the Frog Inn shoot.

The programme of the Interstate Association's trapshooting tournament, given for the Rainmakers' Gun Club, Aug. 12 and 13, at Ottawa, Ill., is now ready for distribution. The events for each day are alike, alternately 15 and 20 targets, \$1.50 and \$2 entrance. Lunch and shells obtainable on the grounds. Targets 2 cents. Practice day, Aug. 11. Shooting will commence at 9 o'clock. The Interstate Association secretary-manager will manage the tournament. The secretary is Mr. Charles Scherzer. Guns and ammunition, prepaid and marked in owner's name forwarded to Jos. L. Boissenin, Ottawa, Ill., will be delivered on the shooting grounds free of charge. Purses divided 40, 30, 20 and 10 per cent. Ottawa is on the lines of the C., B. & Q., and C., R. I. & P., eighty-two miles west of Chicago.

S. T. S. G. and F. P. A. Tournament.

DURING the Memphis, Tenn., tournament, July 3 and 4, Mr. A. B. Pickett, of the Daily Scimitar, made a proposition to present to Mr. Frank, for the Memphis Club, a valuable and handsome silver cup, to be known as the Scimitar cup, and to be shot for by amateurs. Conditions, 100 targets; entrance, the price of the targets; cup to remain the property of the donors until one contestant wins it three times. To be contested for annually only at the League shoots in Memphis. The holder at the time of the next succeeding shoot to be paid \$25 by the Memphis Gun Club.

The contest was held late in the afternoon, when many had left the grounds; and when others saw that the shoot must be of as brief a nature as possible, in order that the same be finished before darkness, a conditional sweep of \$10 was made up among the shooters, and sixteen men shot in the race. If there had been opportunity there would have been fifty shooters. None of the traveling men shot for targets even, owing to the proximity of darkness. Result: Skannal 92, Fletcher 92, Starr 91, T. Quintral 91, Howard 90, Livingston 89, Rierson 89, Price 87, Canale 85, Mercer 84, Frank 82, Buell 81, Moody 80, Wilson 79, North 76, Ferry 72.

Many were the trials and disappointments. There was Starr, of Paducah, who ran his third 25 straight and had 71 out of 75 to his credit, and then he lost 3 out of 4, and 5 out of the 25, and finished with 91, just one less than the winner. Quintral shot well, after trying the quick style of shooting. During the day he dropped to steady, careful style, and came near winning out. This caused some of the observing to say, "that for some reason these were the targets that required steady, careful aiming, and not the quick, slam-bang." If that was so, most of the contestants were too long finding out the same, for their own good.

When it became good and dark John Skannal and J. Fletcher came up for the final contest, after a tie was made by Fletcher missing his last target. To the surprise of John and all, he made the best score of the day—for him—24 out of 25, while Fletcher could get but 20. Thus Mr. Skannal must be set down as the champion for the year 1903, having won all the cups and prizes put up this year. Had he not had the bad luck to miss 4 targets out of 25 in the team race, he would have assisted his team to capture the team prize, and then all in sight would have gone to Shreveport.

Abe Frank was a glad and tired man when the shoot was all over. I doubt very much if he will attempt to run another shoot, as he did this one, almost single-handed.

There are many good people connected with the club here, but all are business men who have little time to assist in getting up and looking after details of a shooting tournament.

Yet all went away expressing themselves as having had one of the very best times of their lives.

The Memphis boys all say, "Come again; next year we will have a bigger one."

If the shoot had been advertised more and the programmes gotten out earlier, and the dates had been fixed and not changed, no doubt 150 shooters would have been in attendance.

Memphis club grounds can accommodate three or four sets of traps, and no doubt they will be in position next year.

League Meeting.

The annual meeting was held in the parlors of the Gayoso Hotel, at which delegates were present as follows: City Park Gun Club, New Orleans, M. Kauffman; Greenville, Miss., J. B. Duncan; Vicksburg, Miss., Club, J. J. Bradfield; Woodville, Miss., Club, J. J. Bradfield, proxy; Memphis, Tenn., Club, Irby Bennett; Laurel, Miss., Club, S. E. North; Caddo Gun Club, Shreveport, John Skannal.

Election of officers resulted as follows: John A. Skannal, of Shreveport, La., President; J. J. Bradfield, of Vicksburg, Miss., Vice-President; John Jenkins, of Shreveport, La., Secretary and Treasurer. Directors: Irby Bennett, Memphis, Tenn.; R. E. Saucier, New Orleans, La.; J. W. Hays, Vicksburg, Miss.; C. W. Walton, Natchez, Miss.; D. P. Shanahan, Greenville, Miss. Tournament Committee: J. J. Bradfield, Vicksburg; A. H. Frank, Memphis; R. E. Saucier, New Orleans.

Much enthusiasm was shown in the question of promoting target shooting and for the protection of the fish and game that are fast being depleted throughout the South. The Board of Directors was voted full power to act as to the best plan to work upon, and empowered to raise such amount of funds as would be necessary to carry on the work connected therewith.

Tournament committee was given full power to arrange tournaments for the next season.

A hearty vote of thanks was extended to the outgoing officers, P. C. Pepper, president, and J. J. Bradfield, secretary, for their services.

Never in the history of trapshooting can a league point to such a large and enthusiastic gathering of shooters as that of the four meetings of this League, held at New Orleans, Vicksburg, Shreveport and Memphis.

To the betterment and enlargement of the scope of usefulness of the League, and that it may be a power when tackling legislative bodies, all the clubs and game protective societies of the South are invited to join this Southern League and help the good work along. A fee of \$5 per year will be charged. Prompt attendance is desired, and all communications on this subject should be addressed to John Jenkins, Shreveport, La.

Ossining Gun Club.

OSSINING, N. Y., July 11.—A few nice prizes were shot for on the grounds of the Ossining Gun Club to-day. What was lacking in attendance to-day on account of the rain was more than compensated for by interest manifested in novelty competition, and the several prizes divided among three shooters.

Event 1 was at 10 bluerocks, 16yds. rise; event 2 was at 5 bluerocks, 16yds. rise, shooters standing on one leg shooting with one arm only. No. 3, at 16yds., gun lying on platform to the left of the shooter at the word "Pull." No 4, regularly at 21yds. rise. No. 5, shooter seated at 23yds., rise gun in lap, not to be raised till target was in sight. Nos. 5, 6 and 7 were distance handicap prize events.

Blandford 21 and 22yds., Bedell 20 and 21, Hubbell 17 and 16. To-day's prizes were Manhattan watch, solid silver spoon, two China cups and saucers, and a fine pocketknife.

These prize shoots will be held every second and fourth Saturday during the summer months. Members only can shoot for prizes, though visitors are always welcome to shoot along:

Events:	1	2	3	4	5	6	7
Targets:	10	5	5	10	5	15	15
G B Hubbell	7	2	1	8	0	8	10
C G Blandford	9	4	3	8	4	14	12
A Bedell	9	1	0

C. G. B.

Boston Gun Club.

BOSTON, Mass., July 8.—The third last serial prize shoot of the Boston Gun Club was held at Wellington to-day, the fine weather conditions bringing forth a fine attendance, though the two steadies, Woodruff and Bell, failed to put in an appearance, which was much regretted by all. Dr. Gleason was right on his mettle to-day, and showed a clean pair of heels to all on average for the afternoon, though Spencer shot well enough to tie him on the prize match. Frank started in in his old form to-day, breaking straight in first two events, though hurrying to shoot a raft of them later made holes in the break column.

Just one lady shooter was present, and while results at first were a trifle unsatisfactory, a 15 out of 20 made up for that, and now the little 2drs. and 1oz. gun shooter is ready for the next shoot.

Allen and Hatch were welcome shooters, the latter's first appearance on these grounds, and just a few more times would be certain to put him back 2 or 3yds. if he kept up the good work.

Other scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	10	15	5p	10	15	5p	10	10	15	25	15

Amesbury, 16	11	1	1	1	1	1	1	1	1	1	1	22

July 12.—The regular weekly shoot of the Boston Gun Club was held at Wellington to-day, the light attendance probably being due to the close proximity of the holiday. Good shooting, however was in order, Woodruff and Wood leading, though Spencer and Barry were not far behind. Other scores as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	15	5p	15	10	15	5p	10	10	15	10	10

Pine Bluff (Ark.) Tournament.

JULY 7 was the day; very hot was the sun, they all say; not only hot on the shooting grounds, but so hot at night that the visitors could not sleep. Well, it must be hot, you know, when a Kansas man could not sleep—that is, we had Heer with us. The Dallas expert was put on "de bum" also, and a local man well used to surrounding grounds and all climatic conditions won the high average. Yet one young man, Wade, from that unspellable town, came well to the front. There is a tree back-ground here that makes the targets hard to see. A magautrap is used, and a bluerock target of course.

The attendance was small considering that there was \$100 added money. It was found, as might have been expected, that the State shoot coming off at Jonesboro the following day, was the attraction, and that the shooters were going to Jonesboro.

The Pine Bluff club is composed of the best shooters in the State, and they are genial, good souls, and when they hold a shoot on dates somewhat remote from any other tournament there will be a large attendance.

Mr. Coles, of the home club, was high man, with 188 out of 200. Then came the well-known Southern expert with 186, and Bill Heer with 185. None others were in the 90 class. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	15	15	20	15	25	15	15	20	15	20	25	175

Inman	16	23	39

Medal contest, 50 targets: Knott 48, Coles 47, Powell 45, Morgan 45, Wright 45, Clements 44, Inman 42, Proctor 40.

Nebraska Trap.

OMAHA, Neb.—In a gun club shoot down at Lincoln the other day, they think they broke the world's record; but they have another think coming. In a team race, five men, 25 targets, they broke them all. The team was composed of Game Warden Carter, ex-Warden Simpkins, J. C. Hindmarsh, W. Bills, and Dick Linderman.

At the Dickey Bird trap meet, July 4, President George Toozer was high gun, with 118 targets out of 150. Game Warden Carter was second and Dan Bray and Gus Schroeder following. The shoot for the Dickey Bird cup, emblematic of the State's championship, and held by W. D. Townsend, was postponed on account of darkness. On the whole, the shooting was way below the standard, the traps were in bad working order, and the men out of form generally.

ON LONG ISLAND.

Brooklyn Gun Club.

BROOKLYN, L. I., July 11.—Mr. John S. Wright, manager of the Brooklyn Gun Club, has been very busy of late preparing his new grounds for trapshooting.

The grounds and their equipment are a vast improvement on the old grounds. The surface is incomparably more level, the background is much better, a broader platform and more ground afford much more room than there was in the old cramped quarters. Mr. Wright contemplates having every detail in perfect order for his shoot on Saturday of this week, a feature of which will be a visit of the Wanderers. To reach the grounds take Kings County "L" to Crescent street, where vehicles will be in readiness for visitors.

At the shoot to-day, Mr. H. S. Welles was easily the best performer. He made several straight scores:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	10	15	10	15	10	15	10	10	10	15	5p
Welles	10	15	9	15	10	15	9	9	..	12	7
Dryer	6	10	5	10	8	9	5	5	6	10	6
Wright	6	9	7	10	6	12	6	7	..	13	..
Hitchcock	6	9	6	12	6	11	5	7
Waters	10	14	..	13	9
Osterhout	3	4	5	..	5	..	2	5

Pittsfield Rod and Gun Club.

PITTSFIELD, Mass., July 6.—The day of sport which was anticipated by the trapshooters of the League of Berkshire County was fully realized July 4. The weather was fine. Shooters from the different towns were brought out, consisting of teams from Greenfield, North Adams, Dalton and Pittsfield. Adams was the only team of the League that failed to make its appearance, thus barring itself from competing for the Peters loving cup.

North Adams won the first shoot of the series for the Peters cup trophy by 11 points over all competing teams.

The match between North Adams and Pittsfield for loving cup was won by the home team by 4 points.

GEO. W. CLAY.

Arkansas Tournament.

FOR the thirteenth time the Arkansas State Sportsmen's Association has met for the purpose of holding a tournament. This time the town of Jonesboro was selected as the proper place, and though it was the thirteenth gathering, it did not prove an unlucky one, as the attendance was larger than any previous one by far, there being fifty shooters on the opening day.

That all-important matter, the weather, was not altogether the best, being hot and dry for part of the day; then, about noon, there was a heavy rain that caused an adjournment, and made the grounds muddy and nasty underfoot. The shelter provided was very meager, and there was a difficult matter to keep out of the wet.

The club would have prepared beforehand for the wants of the shooters. There should have been a large tent of some kind erected, where they could sit and be comfortable.

After the rain the steam from the wet ground made the atmosphere very hot; and yet this is the weather for cotton, and the rain was much needed.

The arrangements of the traps were fair, there being two sets of traps, set to throw north. The ground is level, and would be a good place to shoot if it was not for the trees for a background. Many low scores were made, and the trouble lies mostly in the background, the dark, low-flying targets, and the excess of speed with which they were thrown.

The best shot for the day was Starr, of Kentucky, who lost but 8 out of 160 shot at. William Heer came next with 147, closely followed by Akard with 146, Abe Frank and H. Dixon, 143; D. G. Timberlake 142, G. B. Timberlake 141, Brady, Powell and Coles 140 each.

At the closing of the Memphis shoot there were a few of the shooters took a trip to Pine Bluff for the shoot there. The three Bluff boys, Faurete, Heer, Proctor and some others, were awfully shy on sleep, having had little for the past two nights. Mr. Faurete especially was knocked out; and thus the shooting of these gentlemen fell away perceptibly.

The Missouri and Kansas contingent were quite well up. Paul Litzke, as secretary, was quite busy.

The office was in charge of G. H. Hillman, the expert accountant, one of the Winchester missionaries. It is a matter of the number of expert office cashiers the Winchester men have in their employ, and how well they understand handling a lot of shooters without the least bit of friction.

Thursday, July 9.

The morning opened up bright and warm, and another hot day as experienced. There was little wind, and the trapping was much better. The scores were an improvement by far over those of the first day.

The points did not pay so well, as there were more in the money. The Memphis delegation, consisting of Joyner, Poston and Girard, came over, and with Frank and Brady, made the hot squad of the day, all getting in the money good and plenty. Frank and Poston each made a score that was out of the money, and that was all for the squad during the day. Frank and Brady each made 147, Joyner 146, Girard 142 and Poston 140.

The Kansas-Missouri combination fell away, Ackard going far below his average. Timberlake only showed up at the top, losing but 12. He has to keep busy to beat out the boy who came strong with 144.

No. 2 squad was a hot one, with Heer 153, Starr 149, Ward 145, Faurete 144 and Coe 139. Yesterday Starr was 5 ahead of Heer, and the race to-day was an exciting one. Heer bumped up against some of the unbreakable kind and lost 3 out of his second cent, and then lost but 2 out of next 100, and closed with but 1 lost for the day. Starr dropped one or two in all save the last of first event, and altogether lost 11, and thus Heer gained 4, and at the end of the second day Starr is one to the good.

The attendance remains good, as there were fifty-four who shot all or part of the events. The scores:

First Day, July 8.

Events:	1	2	3	4	5	6	7	8	9	10	Shot

CONCERNING TECHNICAL LANGUAGE.

THE whole trip was marred, complained a disappointed mountain sheep hunter, by the profanity and vulgarity of the guides. They swore at the horses packed and unpacked, and cursed them on the trail and off of it, by day and by night; and this was exceedingly aggravating to mild-mannered citizens, who, as a rule, are used to no harsher language than that employed by elevated railway guards. The complaint was feelingly made, but there was no good reason for it, because the profanity of the guides might have been suppressed on the start if the employer did not like it. As the head of the expedition he had the option of deciding whether or no the trail should be lined with oaths, and if he elected that it should not be, all he had to do was to say so.

The time to say this is on the start. If the guide is a reasonable man, and most guides are reasonable, he will cheerfully defer to his employer's feeling about profanity, even though he may mentally deride it as foolish squeamishness, and he will readily undertake not to swear more than is absolutely necessary. The packer of a Rocky Mountain pack train and the mild-mannered tenderfoot from the East may differ as to the necessity of swearing at all; and however well-intentioned the packer may be, there is always a likelihood that in the course of the trip some exigency will arise which will appear to him to demand the use of certain technical terms. The employer, under such circumstances, if he, too, be a reasonable man, will look upon this occasional strong language evoked by the strenuousness of circumstances as something quite different in its nature from the continuous, needless and frivolous profanity in which many navigators of pack trains are accustomed to indulge. For common and constant swearing on the trail and in camp there is absolutely no excuse, the employer is under no obligation whatever to bear with it, and he may put an end to it before it has had a beginning.

LEADING A DOUBLE LIFE.

ONE and one make two. The man who leads a double life gets twice as much out of life. That is the mathematics of it. The principle is demonstrated in thousands of examples.

As a peculiar searcher out of men's lives the FOREST AND STREAM has cognizance of a host of individuals whose leading of a double life is not fully appreciated by their fellows, and indeed in some instances is hardly suspected. They are the average men who make up the community, toilers in various branches of work, engaged in trades, professions and business. The world knows them as workers, the FOREST AND STREAM knows them as players; for their double life is that of the outdoor world, the stubble, the trout stream, the bass lake, the quail cover, the moose country.

While they may be of many callings and stations in the life that is seen of all men, in the double life, that is to say, the play life, they find themselves more nearly on a level. In camp the distinctions which prevail in home surroundings are largely ignored. As men get back to nature they draw more closely together. The artificial gradations and distinctions are forgotten, just as the most conventional man of affairs at home may in the woods be the one who looks most like a tramp.

To repeat the proposition, he who leads a double life gets a double portion of the good there is in life. Be his hobby the rod or the gun, the paddle or the tiller, he has in it a resource which yields rich returns.

The two lives are not to be measured and compared by the relative proportions of time devoted to each. One may apply himself to work for all but a scanty fortnight or week, yet shall the brief play spell, counting anticipation and retrospection, make up much also of the months not actually surrendered to it.

The business or professional man who is most devoted to his work and most strenuous in his prosecution of it is very likely to be the most absorbed in his sport when he turns to that, the most eager and devoted fisherman on the stream, the most tireless cruiser, the most persevering hunter. The qualities of industry, application, singleness of purpose, energy, enthusiasm and perseverance, which make for success in the home life, are also present and active and controlling in the double life—the play life. These are the compelling forces which make one tote duffle on a carry until he drops from sheer inability to go another step; which make one buck against

the tide until the point has been rounded at the expenditure of the last ounce of pull in the rower's arms.

ENGINEERING AND FISHING.

OUR frequent contributor, Mr. J. A. L. Waddell, of Kansas City, Mo., is known to the readers of our angling columns as a successful tarpon fisherman and angler for other big game fish. Mr. Waddell is one of the most distinguished bridge engineers of the United States, and has undertaken enterprises also in Mexico, Cuba, Canada and Japan; for his work in Japan he has been decorated by the Mikado. Engaged in important work in bridge building in various parts of the country, he enjoys the rare good fortune of finding opportunities of indulging in his favorite recreation in connection with his professional duties. His engineering enterprises in Mexico have borne fruit for tarpon fishermen in the series of articles on tarpon fishing written out of his experiences there. On the way to and from British Columbia, Mr. Waddell has found opportunity to test the rainbow trout; and while on professional visits to Nova Scotia he has drawn attention to the possibilities of the sport of tuna fishing in Atlantic waters. Mr. Waddell is the author of several authoritative works on bridge engineering, and, as might be expected, his fishing papers are intensely practical. They have less of the poetry of angling and more of the useful, instructive and definite description of tackle and modes of fishing.

It need not be added that Mr. Waddell is a strong advocate of the value of field sports from a purely business and professional point of view. He believes in play as a necessary complement of work; and not only does he practice the doctrine, but on occasion he preaches it and urges it upon the younger men in the profession. We have before us an address delivered by Mr. Waddell to the graduating class at this year's commencement of the Rose Polytechnic School. The burden of the address is to celebrate industry, application, study and work as the essentials of professional advancement and success; but with all these the value of recreation from toil is not forgotten. One of the concluding paragraphs may well be quoted as having application to other professions than that of the engineer:

By this time you all have probably come to the conclusion that you have been listening for the last half hour or more to an old fogey, who thinks that there is nothing in life worthy of consideration but work, work, work, and who can talk on nothing but technical subjects. If this be so, I by no means blame you, for you would seem to have reason on your side; nevertheless, you would be entirely in the wrong, because I am a firm believer in legitimate relaxation of every kind, and in a man's getting all the pleasure he can out of life. Perhaps, too, I could talk of things that are far from technical, such as hunting the great game of the Rocky Mountains, canoeing on lake and stream, the shooting of rapids, travels in foreign countries, gunning for wildfowl in the marshes, sports afield with dogs and gun, fly-fishing for trout in the streams of the far North, and struggling with the gallant tarpon on the waters of the Gulf of Mexico; but it was not to discuss such subjects as these that your president brought me here, so I shall desist, only remarking that the more you mix these things and other sports and amusements in with your work, the better will it be for you both physically and mentally, the longer will you live, the more will you accomplish, the more satisfactory will be the results of your work, the better men and citizens will you become, and the more interesting and agreeable will you prove to all with whom you are thrown in contact.

WAR and hunting occupied a large part of the life of early man, and much of the literature of the earliest times is devoted to these two subjects. Examples of this occur so frequently that it is hardly necessary to specify those which are more familiar, but it is interesting to note that the very earliest written chronicles had to do with subjects which concern FOREST AND STREAM. The British Museum has recently published the "Annals of the Kings of Assyria." These are translations of the cuneiform texts and have to do with the lives of the Assyrian monarchs, some of whom lived more than a thousand years before the birth of Christ. They are largely records of wars and victories, and of the renewing of the lands laid waste by the incursions of enemies, but incidentally there are stories of hunting. For example, we are told that Tiglath-pileser I., one of the first of the Assyrian kings to reach the Mediterranean, went sailing for a pleasure trip from Arvad, in a Phœnician ship, and during his sail slew a great dolphin. The reigning monarch of Egypt at that time, who may be supposed to have been one of the immediate successors of Rameses III. of the twentieth dynasty, sent to this same Tiglath-pileser I. a crocodile

and also a great animal called *pagutu*, which seemed to be unidentified. We may suppose that these animals may have been sent alive, or if dead, they must have been embalmed for the long journey with the art for which the Egyptians were so famous.

CERTAIN sportsmen of Memphis, Tenn., who own club houses in Arkansas, have undertaken to test the validity of the new Arkansas non-resident shooting and fishing law, which, by depriving them of the use of their property for the purpose to which it is devoted, has virtually confiscated it. In a suit brought by Mr. W. B. Mallory, of Memphis, recently decided, Judge Allen Hughes, of the Circuit Court at Marion, held that the non-resident prohibition is unconstitutional. He said: "The right to acquire, hold, and enjoy real property in this State is one of the privileges guaranteed to the citizens of any State by Article 4, Section 2 of the Constitution of the United States, which provides that the citizens of each State shall be entitled to all the privileges and immunities of citizens in the several States, as well as the provisions of the fourteenth amendment, which guarantees to all persons within the State the equal protection of the laws."

The real estate principle here involved introduces an element more complicated than the simple right of hunting and fishing. The cited provision of the Constitution has frequently been brought forward as applicable to the overthrow of non-resident shooting and fishing laws, but this interpretation of it has not received the sanction of the courts. The point that to forbid the non-resident owners of a shooting lodge to shoot is thus to render his property valueless to him, is one which, we believe, has hitherto not been passed upon.

A WASHINGTON woman was sitting in her yard at home one day last fall, when a wolf, which had escaped from the National Zoological Gardens, jumped over the fence and bit her. She has now brought suit for damages in \$300 against Dr. Baker, of the Smithsonian Institution, who is the curator of the Zoo. The case will be tried in the District Superior Court. It would appear that Dr. Baker had a good defense in the simple plea that the wolf was not his, and he was not responsible for it. The familiar principle in cases like this is that when a wild animal escapes from the control of one holding it in confinement, it thereupon at once ceases to belong to him; resumes its status as *feræ naturæ*, and is the property of no one until recaptured, when it becomes his who takes it. At the time when this wolf bit this woman, it was not the property of this man. As a wild animal at large its ownership was in the State; that is to say, in the District of Columbia; and the woman's suit should be brought against the District authorities. Dr. Baker's defense is better than an alibi.

AMONG the innovations in the Adirondacks this year is a traveling gospel wagon, carrying an evangelist, an organ and a stock of song books and Bibles into the isolated sections. The outfit is sent into the woods by the Baptist organizations, and the plan of campaign extends through the summer and autumn into the winter. Outdoor meetings will be held in remote places, and sportsmen camping in the vicinity will be given a cordial invitation to attend. The Adirondack enterprise is not unlike the traveling gospel wagons sent out into the mountains of the South from Berea College.

How vitally the interests of Adirondack hotels are connected with the forests, and what forest fires mean to those interests, is well illustrated by the action of hotel men this year who have been at much expense to disseminate published statements that the stories of fires were exaggerated, and that the scenery and forests about them were unscarred. The destruction of the surrounding forest would be a hotel calamity little short of the burning of the hotel itself; indeed, in some cases the owner, if given his choice, would lose the building rather than the woods; one could be replaced, the other not.

THE reports that certain of the North Woods fires were of incendiary origin have been proved true in court. At Glens Falls last week two men accused of having set fire to the Adirondack forests in May, were convicted and sent to prison, one to Dannemora for not more than four years, and the other to the Elmira Reformatory.

The Sportsman Tourist.

Climbing Mount Aetna.

We print herewith the third letter descriptive of Mount Aetna, from the pen of Maj. Albert Woodcock, then United States Consul, Catania, Sicily. Letters descriptive of earlier ascents were published in our issues of May 30 and June 27. These accounts are all the more valued and interesting because possessing the qualities of familiar correspondence.

THIS is your birthday. In remembrance I will write you about my last ascent of Mount Aetna. At 3 o'clock A. M. of August 14 last (1886), a large carriage, drawn by two stout horses, with a company of excursionists, left Catania to make the ascent of the volcano and the descent into Val del Bove. The party consisted of Mr. Wallace S. Jones, U. S. Consul of Messina, and his sister, Miss Jones; Mr. Peter Aelig and Mr. Ritter, Swiss gentlemen (merchants of Catania); Mr. Charles R. Worthington, an English gentleman, and the writer.

A hammock beneath the carriage and a boot at the rear contained blankets, rugs, overcoats and rations for a two days' campaign. The party was a merry one. They were enthusiastic and elated at the thought of climbing into the heavens above the clouds. The horses seemed to catch the spirit of the party and ascended the slope rapidly. We were soon looking down upon Catania with its thousands of lights, and upon the beautiful sea.

The moon was at its full. Its silvery light flashed and sparkled upon the sea. It flooded the valleys. It made more beautiful the orange groves. It robbed the great rocks and lava ridges by the wayside of their hideousness and gave them pleasing and romantic forms. As we ascended the air grew fresher and more bracing. It was uncomfortably warm in Catania when we left. We were ascending through a highly cultivated region. Orchards of orange, lemon, almond and fig and vineyards of grape grow luxuriantly upon the slopes. The Fichi d' India (prickly pear), like grim sentinels, stood out upon the rocks and cliffs. Beautiful villas of the Catanese nobility nestled upon the hillsides. The whole landscape, subdued and softened by the light of the full moon, presented a scene of inexpressible loveliness. In an hour and a half we had ascended to Gravina, an unimportant village of low, lava-constructed houses. Two miles higher up we reached the quaint old town of Mascalucia. Perched high up on the side of Mount Aetna, it commands fine views of the sea and landscape below. One of its old churches, San Antonio, was erected in 1300.

There twilight commenced to steal upon us, and the morning star that had glowed with unusual brilliancy above the Calabrian peaks, began to pale. Still higher up we reached the lava village of Torredi Grifo. We were now above the orange belt. In this high altitude in winter are heavy frosts and frequent snows. The vine, however, flourishes luxuriantly. We now entered upon a barren waste of lava bed, which marks the eruption of 1527. A tough wiry shrub of a bright green color was scattered over the dreary waste. It is called broom (*Genista ctenensis*). It is rich in carbon and produces an intense heat when burned.

We arrived at Nicolosi, 2,265 feet above the sea, at 6 o'clock A. M. The eastern sky was flecked with gold, and the mountains seemed islands in a golden sea, as the sun showed his radiant face above their peaks. Nicolosi is an earthquake-riven town, and has several times been shaken to the ground. The lava flood of May last approached within a thousand feet of it. It there stands a black, hideous mass, still hot and sending off sulphurous vapors. We rested at Nicolosi for an hour, refreshing ourselves with cold coffee, bread and cheese.

Signori Orazio Silvestri, professor of chemistry, geology and mineralogy of the Royal University of Catania, is a ripe scholar, and has won an honorable name among scientists. He has made Aetna a study, and has given to the world his scientific researches of this wonderful volcano and its eruptions in several valuable works. Andrea, the servant of Professor Silvestri, had preceded us the day before, and had made all arrangements for our cavalcade. Casa Inglese (English House), at the foot of the great cone, the resting place of excursionists, had lately been injured by an earthquake, and was undergoing repairs, so that it could not be occupied. The professor courteously tendered us the use of the observatory, and also his servant Andrea, an athletic, intelligent, young Sicilian. Andrea had made many excursions to Mt. Aetna with the professor, and was well posted. He soon paraded before us our steeds and guides. These consisted of nine mules, two guides and three muleteers. In the chief guide, Antonio Mazzalia, I recognized my old guide of 1884. On that excursion I was ascending in the night. Antonio approached too close to the rear of my mule, who kicked viciously with both hind feet, striking him in the breast and laying him out upon the sharp lava rocks. You will remember that I wrote you at the time that his head was badly cut and bled profusely; that he was picked up partially insensible; that we were obliged to leave him at Casa del Bosco, where on our return we found him able to ride back to Nicolosi. He said that *il Diavolo* had been disgraced by being condemned to hard labor in the lava quarries, but that he was glad to state that the mule was not dead. I was sorry, for barring his vicious qualities, *il Diavolo* was a noble animal. Antonio, a splendid and most faithful guide, is stalwart in frame, a little over six feet high, and knows much about Mt. Aetna, to which he seems devotedly attached. Vincenzo Carbonaro, his assistant, is also faithful, reliable and an intelligent guide. Our rations and duffle were packed on three mules. The other six were formed in line before us. The order was given:

"Prepare to mount! Mount!" and we mounted and away we went on a trot, Miss Jones leading. The populace about us were calling on the saints to bless the signori and signorina, and the dogs joined in with a barking chorus. The direct road of ascent is covered

by the lava flood of May last from twenty to a hundred feet deep. We were obliged to make a detour around this hideous field of black desolation. We flanked Mont Rossi (the Red mountains) on the south. These are twin mountains that were thrown up by the eruption of 1669. From them came the great river of lava that flooded the country, destroyed 14 villages, and rolled into the sea by the Catania Lighthouse, destroying a portion of that city. It covered a surface of forty square miles. The Monti Rossi have altitude of 3,110 feet above the sea. A large number of cones are clustered about upon the slopes of the great volcano. This is a wonderful and interesting feature of Mount Aetna. Nearly all of these cones are the extinct volcanic craters of the past ages, and range in altitude from 200 to 899 feet above their base. Their number is estimated at 300. We counted 30 of them between us, and the great cone of the volcano.

Soon after leaving the Red Mountains, we came to a spur of the lava bed of May last. It was insufferably hot. Our mules quickened their pace in crossing it. We had left the cultivated region at Nicolosi and were now entering the wooded belt. The trees were mostly of a young growth of chestnuts. Wood being in great demand, the trees are cut before they reach the ordinary size. In this same wooded region, however, on the west side of Mount Aetna, there are several monarchs of the forest that have escaped the woodman's ax. They are said to be the oldest trees living, and are without doubt 1,000 years old. They are named respectively, *Il Castagno di cento Cavalli* (the chestnut of 100 horses), *La Nave* (The ship), *L'Imperio* (The empire), and *Il Castagno della Galea* (the chestnut of Galea). The first mentioned derives its name from the incident that one of the queens of Arragon, with her troop of 100 horsemen, found shelter beneath its branches from an Aetna storm. The accumulated soil of centuries has submerged its trunk, its branches above the surface, each being a large tree. In 1884 myself and six others found shelter from a rain storm in the hollow of one of these branches. A road passes through them. The trunk of *Il Castagno di cento Cavalli* is said to be 180 feet in circumference, and the diameter over 50 feet. The circumference of the others averages about 75 feet. They are gnarled, ragged and gray and begin to show signs of approaching dissolution. The Government protects them.

Our ascent was very slow and tiresome to the mules. The last May eruption had covered the ground with volcanic sand. The trees seemed to rise from a black sandy desert, there being no green thing visible but their ramage. We reached Casa del Bosco (House of the Woods) at 10 o'clock A. M., tired and voraciously hungry. We were now at an altitude of 4,216 feet above the sea. Casa del Bosco is the last resting place before the final climb to the summit. It is a low one-story building with two rooms, in one of which is a large, open fireplace. We had the deal table of the Casa set beneath the wide spreading boughs of a chestnut. Our seats had been constructed from the crotches of trees and were beautifully rustic. Our friends of the Alps (Aellig and Ritter), and Worthington (my English chum), set the table with fine taste and elegance, Chickens, boiled ham, tongue, eggs, cheese, bread, fruit, coffee, vino del bosco and ice to cool our drinks were before us. What a meal for an epicure! We set to with a will. Food never tasted better. Birds twittered in the trees above us. Zephyrs made music on their Aetolian harps. The joke went around, and mirth prevailed. According to ancient writers, this region is the home of the Cyclops giants, and here the beautiful wood nymphs are wont to move with sprightly grace in the joyous dance in these sequestered bowers, while the god Pan pipes his pastoral lays. We, however, saw no Cyclops, no Pan, no nymphs save the American one, who sat with us at the table.

Our breakfast over, the mules having munched their grain and taken in draught at the cistern, we mounted at 12 o'clock, and were away again on the climb. In our winding way upward we passed many of the mountain craters, among which were San Iso, Rinazza, Elici Concilio, Sona, Ardizza, Grasso, Capriolo and Nero. We were now at an altitude of 6,000 feet. The views of sea and landscape were indescribably grand. The rich valley of the Simeto lay like a great chart outstretched at our feet. The valley, in the time of the Cæsars, was the granary of Imperial Rome. We looked down upon a vast number of villages that dotted the valley. Aderno, Paterno and Motta, with their old Norman castles, seemed unusually near. Centuripe (a town founded centuries before Christ), upon a high mountain crest beyond the valley, was sharply defined against the sky. We could see the river Simeto meandering on its way through the valley, a shining, silver thread from its source to its mouth. We looked down into the great black throat of the new crater Gemmellaro, that was thrown up in May last. The new lava fields lie below us, stretching away from Gemmellaro to Nicolosi. They presented a horrid scene of rough, blackened desolation about five miles in length. The superincumbent lava is from 20 to 100 feet thick. This new crater, when in its most active eruption, vomited forth incandescent lava at the rate of 131 to 196 cubic feet per second. Near the crater the great stream of liquid lava flowed at the rate of 150 to 200 feet each minute.

The ascent now became steeper and more difficult. We wound around the east side of Mount Castello and ascended between Monti Agnuolo and Frumento. We were above the habitable zone. All appearances of vegetation had ceased. No bird fluttered by us, no cricket chirped. There were no signs of animal or insect life. All about us was black desolation. Sun-lit clouds were hanging upon the crests below us. Our way was over black volcanic sand and loose boulders of lava. We were soon upon Piano del Lago (the plains of the lake). Piano del Lago was formerly a lake fed by the melting snows of the great cone. Lava floods have filled it, and it has ceased to be a lake. Our mules acted as if they wished to lie down, but thwak! thwak!! thwak!!! went the whips of the drivers. Poor mules! I felt sorry for them. They are certainly the most patient, the most enduring and the

most abused of the horse kind. Casa Inglese seemed very near, but O how far away. We finally reached it at half past 3 P. M. Our mules were puffing and panting, and we were tired enough.

Casa Inglese is 9,652 feet above the sea. It is situated at the base of the great cone. It was erected in 1811 by some officers of the British Army. The English at that time occupied Sicily. Napoleon was in possession of Italy, and was in the height of his glory. It is a low, one-story building, constructed of lava rock. It stands east and west. In one of the three rooms is a fireplace. This building is the refuge of excursionists to Aetna. Its furniture consists of a deal table, a few chairs, and several rough board berths, similar to those in a ship. A little straw in each berth comprises the bed. Brydone, an Irish traveler, who visited Aetna 110 years ago, in his sprightly book, exclaimed:

"What a glorious situation for an observatory!" The observatory has become a reality. It is a low two-story building surmounted by a dome. It is built of lava rocks, the walls being of unusual thickness, to withstand the frequent shocks of earthquake. It is joined to Casa Inglese, the latter being a lean-to on the south to the former. A telescope and all other instruments requisite for making observations in astronomy, meteorology, etc., have been purchased and will soon be mounted in the building. Owing to the kindness of Professor Silvestri (as before stated) we were in possession of the observatory. Here we found beds, bedding, table, chairs, etc., designed for the use of the scientists. These, for the time being, were ours, and we were supremely comfortable.

After an hour's rest our company mustered for the ascent of the great cone. It towered into the heavens 1,200 feet above us, its sides being very steep.

"But Aetna with his voice of fear
In weltering chaos thunders near;
Now pitchy clouds he belches forth
Of cinders red and vapors swarth;
And from his caverns lifts on high
Live balls of flame that lick the sky;
Now with more dire convulsion flings
Dispolled rocks, his heart's rent string,
And lava torrents hurls to day
A burning gulf of fiery spray."

We crossed several great cracks or fissures in the ground, made by the late earthquake, that injured Casa Inglese. We climbed upward diagonally across the western slope of the crater, which is less steep. Our friends of the Alps and my chum Charley made a bold strike for the highest point of the crater, climbing up straightaway on all fours. This was too ignoble a position for American Consuls and an American lady to assume, so we parted company. An immense snow field was in the way, rendered dangerous by melting. This we flanked. Volcanic sand, scoria, ashes and loose boulders made the ascent very difficult and wearisome. Every step we would slide back, losing a third or half of the step made.

We finally reached the north rim of the crater. O! what a wonderful scene burst upon our vision! The grand old sea and the Calabrian peaks lie outstretched before us. Sun-lit clouds in great billows were floating below us. These, though wonderfully beautiful, dyed in the rich colors of the declining sun, shut off the greater portion of the island from our view. On my visit to Aetna in May, 1884, the atmosphere was much clearer. We could see the greater part of the island. The entire east coast was outstretched below us. The billows of the sea breaking upon the rocky coast, gave it a silver edging. Two cities and a vast number of villages and hamlets incrustated the seashore, dotted the valleys and nestled on the hillsides. The Sicilian mountain chains rose about us in great irregular ridges, crest peeping over crest. Stromboli to the north (seemingly but a stone's throw away), protruded his rocky head and shoulders above the sea. This little giant appeared to be striving to outdo his great monarch Aetna. He was throwing a dense column of black smoke thousands of feet into the heavens. Adjacent was the little island volcano throwing upward white puffs of clouds. Mount Aetna at the same time was shooting upward an immense column of sulphurous steam, rendering it impossible to see much of the interior of the crater. An inky black cloud hung below us at the west. From it came zig-zag chains of lightning flashes and thunder peals. We looked down upon the storm. It was raining below us. We were in the sunshine above.

When the heavens are free of clouds, from the rim of the crater the whole island with its innumerable mountain peaks is visible. With a glass the waves of the sea may be seen breaking in foam upon the rocky coast of the entire island. Malta is visible in the south, Stromboli and the Lipari Islands to the north, the Aegadian Islands to the west, and the three great seas of the Mediterranean, the Ionian, the African and the Tyrrhian. Brydon says:

"Description must ever fall short, for no imagination has dared to form an idea of so glorious, and so magnificent a scene. Neither is there upon the surface of this globe any one point that unites so many awful and most sublime objects." We threaded our way along the narrow rim, crossing several white bands consisting of ammonia salts. Sulphurous acid gas more or less impregnated the atmosphere. The crater is oval in form, its rim, as before stated, is about three miles in circumference. Since the eruption of last May the crater has been generally quiescent. No smoke was issuing from it. At certain points of the rim and interior sides, small jets of sulphurous steam were issuing. We crawled up to the edge of the rim, lie down and with heads extended over it gazed down into (what many of the superstitious people here believe to be) the mouth of hell.

Upon the highest point of the rim to the west, were our friends beckoning to us. They looked like pigmies. We sauntered back toward the west to see the sun set. The ground was warm to our feet. Mr. Jones took a seat upon a boulder, and I upon another. He declared that his was red hot. Mine was uncomfortably warm. A little jet of steam issuing from a hole

not half an inch in diameter by my side, struck my hand, nearly scalding it. Miss Jones defied the fatigue that prompted the Consul and myself to accept the hot seats tendered us by Aetna and remained standing. The sun was low down in the west. He seemed to swim in a sea of glory. A stratus of clouds lie low in the heavens shutting off all view from the west. The stratus did not resemble clouds, but looked like a vast sea flecked with gold by the setting sun. As the sun neared the western horizon, it cast a great purple shadow of Aetna against the eastern sky. It was triangular shaped and seemed to hang vertically in the heavens. For a time the rising moon shone with its silver light in the very apex of the purple pyramid. It was the strangest and most beautiful scene my eyes ever beheld. Mr. Jones and I held the fort upon our bowlders until the sun disappeared. Then came the descent, which was easy enough. For every three steps made we gained one by sliding. We were but half an hour in making the descent. While descending the Consul and myself engaged in a snowball battle. He, though reared in a country where they have no snow, was the victor.

When assembled about the dinner table in the evening, tired and weary though we were, each one was full of stories about the wonders of Aetna. Our dinner dispatched, we were soon in bed, dreaming of climbing inaccessible heights, or falling into yawning sulphurous gulfs, that is to say, I suppose the others of the party so dreamed, but I slept like a log, and was perfectly unconscious until 3 o'clock A. M. of Aug. 15, when the Alpine horn sounded reveille.

ALBERT WOODCOCK.

Natural History.

Our Batrachians and Reptiles.—V.

PERHAPS it began with the sad experience of our earliest ancestors with the serpent in the Garden of Eden, but however much dependence we can put in that story, it is certain that from time immemorial snakes have played an important part in the affairs of mankind. Among all peoples and in all times they have been regarded with horror or veneration. They have formed the basis of hundreds of myths and fables and have left their impress on literature and art. At the present day it is only among savage races that they are worshipped and given credit for great wisdom and cunning, but among civilized people they are surrounded by a wall of misconception and superstition through which the naturalist tries almost in vain to break.

The reason for these exaggerated ideas can readily be understood. The method of locomotion, the manner of securing and swallowing the prey, and the whole appearance of the snakes is unusual and almost unique among vertebrate animals. They are usually silent, but may give vent to a startling blowing or hissing sound, and their lidless eyes seem always to be on the alert. Their colors, although often brilliant, are such as to harmonize in the most perfect manner with their surroundings. Their movements are often exceedingly rapid and are apparently controlled by an intelligence too subtle for our comprehension. Add to these the facts that a goodly number of snakes are venomous, and that the dangerous ones are often distinguished from the harmless ones with some difficulty, and it is easy to see that all snakes have come to be regarded with suspicion and horror.

To the minds of most people this condition of affairs does not seem to be undesirable, nevertheless it is unreasonable, for a careful study of the serpent fauna of the world has shown that the great majority of these animals are not only harmless, but useful, and as exterminators of vermin deserve our protection. In the United States about 170 species of snakes are known to occur. Of these, perhaps 20, including two coral snakes, the copperhead, the water moccasin, and twelve kinds of rattlesnakes are known to be venomous. The remaining 150 are non-venomous, and, as far as their bite is concerned, are to be regarded as harmless.

With the exception of thirteen species all of our harmless snakes belong to a single family known to zoologists as the *Colubridæ*. The members of this group are characterized by having both jaws fully provided with teeth which are sharp, recurved, and conical, but not in any case specially enlarged and grooved or perforated (as are the fangs of all venomous species). The top and sides of the head are covered with large shields, the back is protected by medium sized, overlapping scales, and the belly, from the throat to the vent is covered with broad, band-like plates. The tail is conical and tapering, and the plates which cover its lower surface are, almost always, arranged in two alternating rows. Within the family the genera and species are distinguished by the modifications of the above characters. The arrangement and number of the head shields, the number of rows of scales around the body, the number of plates on the belly, and lastly by the color and size.

So far as the habits and habits are concerned these animals present the greatest variety. The little worm snakes seem to spend almost the whole of their time beneath the stones and decaying vegetation of the forests, while the beautiful green grass snakes are very perfectly fitted for a life among the growing vegetation, and are often found coiled up in some low tree or are seen slipping about among its leaves. In the large blacksnakes, house snakes, and garter snakes we find species which move about a good deal in the daylight, pursuing their prey wherever it may happen to be and relying upon their own swiftness to carry them out of danger. The water snakes, as their name indicates, live in the neighborhood of water, where they find the frogs and fish which constitute their food and into which they can retreat on the approach of an enemy.

Of these snakes probably the best known, certainly the most frequently mentioned in the newspaper stories, is the blacksnake (*Bascanion constrictor*). It is one of our largest species, and perhaps the swiftest and most graceful. It is a long, slender animal, with a distinctly

marked head, and a slender, whip-like tail, which constitutes about one-fourth of the entire length. In color it varies among the adults according to locality, from a lustrous black to lead color or yellowish olive, the darker varieties being found in the Eastern States and the yellowish ones in the Southwest. The young differ greatly from the adults. With them the ground color is grayish or greenish-brown relieved by a series of brown, black-bordered blotches on the back and numerous small, scattered specks on the sides and the head. Their color beneath is greenish-white, with three or four dark specks on each scale. They begin to assume the appearance of the adult when about 18 inches in length.

It cannot be denied that the blacksnake is a bold and saucy animal, full of curiosity, and not at all reluctant to fight viciously if cornered. The reports of its powers,

Fig. 1.—The Blacksnake (*Bascanion constrictor*).

however, are so often grossly exaggerated that it has come to be much more feared than it deserves to be. The common belief that it will pursue a fleeing person who has aroused its anger may be based on fact, but the stories of its having caused death by squeezing have never been authenticated. Its antipathy to the rattlesnake is vouched for by several competent observers, and they all aver that in a fair fight the blacksnake is more than a match for its venomous adversary. Dr. Elliott Coues, in describing such an encounter, says that the blacksnake threw several coils of its body behind the rattlesnake's head and several more further back and then, by a powerful muscular effort, tore the rattler in two. A family living in Mississippi once saw a blacksnake come crawling up the steps of their veranda, as if in search of some-

Fig. 2.—The Hognose Snake (*Heterodon platyrhinos*).

thing. Curious to know what it was after, they did not disturb it, but followed it quietly. The reptile went from room to room examining all the corners. At length it reached one of the bedrooms, and almost immediately there was heard the humming of a rattlesnake, which had by some means entered the house and secreted itself under the bed. Without a moment's hesitation a fight began, which did not end until the rattlesnake lay dead on the floor. It is needless to say that the blacksnake was allowed to go about its business with the best wishes of those who witnessed the encounter. Prof. A. E. Verrill, of Yale University, states that one of his students once caught a large blacksnake, which, on being choked, vomited a copperhead two feet long, and a few minutes later a large frog was disgorged.

The ordinary food of this creature consists largely of small mammals, such as rats, mice, and ground squirrels, but it is also a great destroyer of birds, climbing to their

Fig. 3.—The Watersnake (*Natrix fasciata*).

nests and swallowing eggs or the young. The wild antics of the parent birds when their home is invaded has probably given rise to the notion that this snake has the power to charm the animals which it wishes to devour, and thus to deprive them of the power to escape.

The ability to swallow morsels of the most disproportionate size is as markedly a characteristic of the blacksnake as it is of any other species. This is made possible by the extremely loose structure of the jaws, all the bones being held together by ligaments instead of firm sutures, so that when occasion arises the gap of the mouth can be stretched far beyond its ordinary size. The teeth are like recurved hooks, and by reaching forward alternately with the lower and upper jaws the prey is worked down the snake's throat. No previous lubrication is necessary, the idea that the snake first covers its victim with saliva being erroneous.

On the approach of cold weather the blacksnake begins to search for some secure hiding place in which to lie torpid during the winter months, and as sometimes many

individuals select the same place, entwining together for warmth, "balls of snakes" are formed, the finding and destruction of which are widely published in the newspapers.

Sometime during the summer, the exact time being unknown, the eggs are laid. These are about an inch and a half long and are covered with a white, tough parchment-like skin. When first hatched the young are nearly a foot in length. It is not known whether they are cared for by the parent or are left to shift for themselves.

On the whole the blacksnake is a useful reptile, and by those who are able to let their knowledge of its value outweigh their antipathy to snakes in general, is encouraged to remain about the premises. The presence of a single one in a stable or corn crib will do more toward ridding the place of rats and mice than will half a dozen cats.

One of the most interesting members of this group of harmless snakes, and a very common one in the Eastern States, is the hog-nose snake. It is also known locally as the dry land moccasin, blowing viper and spreading adder, all three names referring to its supposed venomous qualities. It is a snake of medium size, rarely exceeding three feet in length, and in color varies from almost uniform black in some specimens, to light yellowish-brown in others. The lighter colored individuals are always strongly marked with dark spots and irregular bars. It may always be easily recognized, however, by its nose, which bears a large scale, triangularly pointed and up-curved, so as to give the head a most peculiar appearance when seen either from above or in profile.

When this snake is undisturbed it does not differ greatly in its general appearance from several other species, except that its body is rather short and clumsy, but let it be suddenly surprised by another animal and it begins a performance which one has but to witness to understand why it has been given its local names. It will flatten out its body until it is twice or thrice the ordinary width, and with violent blowings and hissings throw itself into a coil ready to strike. If the enemy is not frightened away by this demonstration the snake will lunge forward and appear to make every effort to bite.

It seems to work itself into a frenzy and no animal could appear more dangerous, but if the investigator has courage enough to continue his experiments he will discover that this snake is the greatest "bluffer" in the animal kingdom. The author has repeatedly tried to get the hog-nose to bite him, but so far has been unsuccessful. The mad lunges seem to be delivered with a closed mouth, and even if a finger is purposely forced in among the teeth, the snake will not close the jaws.

As a last resort the animal pretends to be dead, rolls over on its back, becomes nearly rigid, and with open mouth and protruding tongue lies motionless. It is amusing to notice that if turned right side up again it will quickly turn over, seeming to realize that a really dead snake must lie on its back. It will remain in this condition as long as danger threatens, but as soon as safety seems assured will slyly creep away. This habit of feigning death has been observed many times, but it is possible that it is not practiced by every individual. Out of a lot of eighteen young, just hatched, three were observed to perform this act with all the ability of the adults, but the others could not be induced to try it.

The hog-nose snake is most often found in dry and dusty fields, but is at times discovered in the neighborhood of the water. It feeds on frogs, toads, insects and probably various small mammals. We do not know as yet what use is made of the curious scale on the snout, but the theory has been advanced that it is employed in rooting up the ground in search of food. The eggs are laid during the spring or summer and hatch in the early fall. Various observers differ greatly in recording the number of eggs which may be laid, some testifying to over 80 and others to less than 25. Others state that the snake gives birth to living young, but this is to be doubted. When the young emerge from the eggs they are about 8 inches long and for a time they seem to be cared for by the adults. It is reported that when danger threatens such a brood the mother will seek to protect her babies by letting them run down her throat, an act seemingly very improbable, but one which in the case of certain other snakes at least, is now accepted as quite well authenticated.

Even at the risk of tiring the reader, the author cannot close this brief account of the harmless snakes without mention of the group of watersnakes belonging to the genus *Natrix*. About twelve species are known from the United States, most of them occurring in the eastern and southern half of the country in the neighborhood of water. They are rather thick bodied and clumsy snakes, and are usually more or less blotched or striped with blackish on a ground color of dark brown. In several of the species the head is rather large, flattish, and quite well marked off from the body. They are vicious animals and when discovered and attacked on land flatten out their bodies and do not hesitate to bite. Their appearance and habits are so similar to the true water moccasin (*Agkistrodon piscivorus*) that the name "moccasin" has come to be very generally applied to them, a fact which has undoubtedly led to much confusion among those who are not familiar enough with snakes to detect the mistake. As the next chapter will be devoted exclusively to the venomous snakes, it is not necessary here to enter into discussion of the differences between the harmless watersnake and the dangerous water moccasin, but it cannot be out of place to say that the great majority of water moccasin stories in the newspapers are, beyond the shadow of a doubt, based on the watersnake.

In addition to the family *Colubridæ* three other families of undoubted harmless snakes are represented in our country. In the extreme south and southwest an occasional specimen of blind snake (family *Glauconidæ*) is collected. They are all burrowing species of small size and have the eyes almost completely hidden by the head shields. The boas (family *Boidæ*), so well known from the great boa constrictor and anaconda of the tropics, are represented in our fauna by two species which occur in the States along the Mexican border. They attain a length of four or five feet and may be known by the absence of the large head shields and by the vertical pupil of the eye.

Two species of blunt-tailed snakes (family *Charinidæ*),

are found, one in Southern California and Arizona, and the other from Central California to Washington. They are snakes of medium size and may be recognized by their short blunt tail and vertical pupil.

Still another family, which may be known as the groove-toothed snakes (family *Dipsadidae*), should perhaps be included here as in spite of the fact that they are provided with enlarged grooved teeth, and are closely related to species which are known to be venomous, they themselves are apparently harmless. Six species of this group are known to occur in the Southern and South-western States.

In the foregoing account it has not been possible to more than touch upon the commonly accepted superstitions regarding the harmless snakes; a volume might be written on this subject alone, but it is the belief of the author that if these creatures are carefully observed, enough can be learned to convince any one that they have been greatly misunderstood and grossly maligned. Most snakes are harmless, many are extremely useful, and because there are in the world some venomous snakes the innocent ones should not be made to suffer. Our efforts should be to separate the dangerous from the harmless kinds, to exterminate the ones and to secure to the others the life and freedom which are as much their birthright as they are our own.

Some Midsummer Notes.

MIDSUMMER, as all picnickers and campers-out know, is an excellent time for studying the nature and habits of insects and creeping things. All creation now seems to be on the go. Midges fall into the lemonade, ants run over the sandwiches, flies fight for their share of the sweets. Crawling creatures of a hundred varieties, all equally loathsome, take the measure of our garments. But few persons stop long enough to observe carefully the appearance and habits of these small intruders; the only feeling is one of hostility to their presence, and a desire to get rid of them. Yet the humblest fly or the most disgusting worm is a creature worth observing—wonderful in construction, often exquisite in color, and evidently designed to fill some purpose in the economy of nature.

Recently I noticed a little ant running along the ground carrying a crumb of bread much larger and heavier than itself. Its strength, in proportion to its size, was immense. It was, I should think, at least as though a man of 120 pounds' weight should attempt to carry a barrel of flour through a thicket of trees and underbrush. Yet in spite of the bulk and weight of its burden, the tiny creature proceeded with great rapidity and apparent ease. All sorts of obstacles were in its way, pebbles and bits of sticks, which must have seemed formidable to a creature so minute, but over these or around them it made its way without hesitation. Thoreau's Indian Joe carrying his canoe through the Maine woods was nothing to this achievement.

At one point in its path lay a pebble as great in bulk as a boy's marble; it was many times higher than the creature's head, and was insurmountable. Around this huge boulder the ant was compelled to make its way; but on the other side of the rock an enemy lay in wait—another ant. As soon as the first ant came into sight this second ant rushed upon it and attempted to take its precious burden from it. It was a regular attempt at a "hold-up," such as we used to read in books were practiced by Claude Duval and Sixteen-String Jack on Hounslow Heath and Shooter's Hill, but which now, alas! are everyday affairs in every part of our own country. The laborious ant at once dropped his burden, but not to run away; he promptly engaged tooth and nail with the footpad. The contest was long and doubtful, but I had the satisfaction of seeing the villain put to flight, when the ant took up his crumb again and resumed his way. I had no time to watch him further, but I presume he got safe home with his burden. I measured the ground that the creature had gone over, and I found he had traveled about 15 feet inside of five minutes. To do this I calculated he had taken at least a thousand strides, and was about the same thing as if a man should walk through the thicket with his barrel of flour at the rate of 12 miles an hour. It was a wonderful exhibition of physical power in so small a creature.

Caterpillars are not usually thought to be attractive, especially the hairless variety; but I was interested one day for a few minutes in one of the latter. I noticed one letting himself down from a moderate height by means of a thread, which he was spinning as he descended. When he approached the ground I took hold of the thread near the creature and held it aloft; he continued to spin his thread and descend; again I lifted him up, and he kept on spinning for a while, when he stopped. He had evidently exhausted the material of which he made the thread. I found that in all he had spun a length of 15 or 16 feet at the rate of about 5 feet in a minute. This seems to me a very rapid rate of production, if, indeed, anything in the way of production were done more than to allow the mass of gluten within the caterpillar to be drawn out by the weight of the descending body.

Perhaps no one has ever determined the physical strength of an insect as shown by the length of time that it may continue on the wing, yet I made a little observation one afternoon that interested me. I was in a skiff fishing on Lake Michigan just off the mouth of Black River, a quarter of a mile from the shore, when I noticed a small yellow butterfly winging its way across the water. It came almost straight toward me. It passed close by my boat, and I thought it meant to stop with me, but it went on, and I wondered how far it could fly. However, it went but a few rods further when its flight became feeble, and soon it fell upon the surface, only to be snapped up by a hungry fish. I presume the insect had been fluttering about all that summer day, but resting much of the time on the flowers. I doubt if it could fly a mile at one effort.

Game Bag and Gun.

The Antelope's Sight.

In your paper of June 6 you express a hope that those who have made observations about antelope will give their opinions as to the power of scent possessed by those animals.

Judging from my own experience, and that published by other sportsmen, I believe that the species of antelope which have for ages lived on open plains, have acquired the habit of trusting for safety to their eyes, and either have feeble powers of smell or else pay no attention to the scent of their enemies.

The species which live either in thick jungles or on mountains where the inequalities of the ground enable their enemies to creep close to them, possess a good power of scenting—but also depend greatly upon sight, their vision being remarkably acute.

When stalking the black buck antelope (*A. bezoartica*) I am certain, from the experience of some years, that no trouble need be taken by the hunter to prevent them smelling him, but in places where they have often been shot at, everyone must be taken to avoid being seen, even when they are hundreds of yards distant.

I have observed the same facts with regard to the *Gazella bennetti*. Although the writer of "A Manual of Indian Sport" states that gazelles have a "very keen sense of smell," I have lain behind a bush or rock within 100 yards of a herd, when a gentle breeze was blowing directly toward them, and they have taken no notice whatever. On the other hand, I have seen them watching me from a distance of 700 or 800 yards, and they have run away the instant I have turned in their direction.

The four-horned antelope (*Tetraceras quadricornis*) always lives in thick jungle, and has, I believe, a good sense of smell as well as sight, but trusts very much to evade his enemies by lying hidden, and is usually killed by snapshots when rushing through bushes within 20 or 30 yards.

The nilgao (*Portax pictus*) has excellent sight, and in places where he is hunted, becomes very wary. I cannot speak from experience as to his power of smelling, because at the time when I shot some I imagined that it was like that of the deer tribe, so was always careful to approach up wind. Probably it is good, for Sir Samuel Baker states that he found them more difficult to stalk than Sambhur deer, which will scent a man half a mile away.

Mr. Baillie Grohman, who has had great experience in hunting chamois, describes them as having remarkably acute smell as well as sight. During the late discussion in FOREST AND STREAM about protective coloring, I do not think that attention was drawn to the fact of this being chiefly adapted to the times and places where it is most needed. The cheetah deer, for instance, (*Axis maculatus*) is easily seen in open places, where he can also see and smell his enemies; but when feeding, as is his common habit, in bushy jungle, the coat blends so exactly with the bright light upon the leaves, and the dark shadows under them, that I have looked intently from a distance of about thirty yards, at a place where I knew two or three deer were standing, and have been unable to distinguish them from the foliage until they ran away.

When resting during the heat of the day these animals usually lie down in grass so thick and tall that they cannot be seen, even from the back of an elephant, until almost trodden upon.

The zebra generally frequents open plains where protective coloring is not needed in the day time, but is in danger chiefly at night, when approaching pools of water to drink.

Mr. Francis Galton, in the account of his journey to Damaraland, says: "No more conspicuous animal can well be conceived, according to common ideas, than a zebra, but on a bright starlight night the breathing of one may be heard close by you and yet you will be positively unable to see the animal. If the black stripes were more numerous, he would be seen as a black mass; if the white, as a white one; but their proportion is such as exactly to match the pale tint which arid ground possesses by moonlight."

It would naturally be thought that such a large animal as a giraffe can be easily seen, but Gordon Cumming stated that they are "invariably met with among venerable forests, where innumerable blasted and weather-beaten trunks occur," and adds that he frequently could not distinguish them without the help of a telescope; both his savage attendants and himself being liable to mistake a trunk of a dead tree for a giraffe, or vice versa.

Siberian Arms.

It would greatly interest the numerous readers of FOREST AND STREAM, who are devoted to woodcraft, if your correspondent, L. Lodian, would kindly add to his very instructive descriptions of Siberia, some account of the guns and methods of trapping employed by the hunters of that great country. The rifles used there during the first half of the nineteenth century appear to have resembled, in many respects, those of the early backwoodsmen in America, being heavy in the barrel, but still smaller in the bore, owing to the high cost of ammunition and difficulty of carrying sufficient for a long residence in the forests. I have read of fur-hunters at the annual fair of Nijni Novgorod, whose rifles carried balls weighing only 400 to the pound. In a book called "Recollections of Siberia in 1840-41," by an Englishman named Cottrell, the following description is given: "The common rifle barrels are made at Tobolsk, are very heavy and have a very small bore. The grooves are round, instead of perpendicular, and the ball, which is cut instead of cast, is forced in, and the edges rounded off in ramming down. The lock is large and awkward-looking, the springs on the outside, that of the cock clumsy and not tempered. The whole machine works so slowly that you may see the trigger stop and move on again during the progress of the cock toward the pan. The charge does not contain 50 grains of powder. In the event of a spring breaking, the chasseur readily replaces it by one of wood, generally of larch, which answers his purpose equally well, and he is thus independent of the gunmaker. With all these imperfections, as we have said be-

fore, they rarely or never miss, and always hit an animal whose fur is precious through the muzzle. Rifles of this sort cost here twenty-five roubles; powder is five roubles a pound, and lead is also dear."

Within a few years afterward the flint lock was replaced in Siberia, by the percussion, the rifles maintaining their high character for accuracy. An English artist named Atkinson, who had traveled there, wrote a work called "Oriental and Western Siberia," published in 1858. He there states "The barrels are bored out of the solid metal and rifled with five grooves, having one and a quarter turn in the length of the barrel; they are usually made very heavy. The stocks are of birchwood, the locks obtained from Nijni Novgorod and are exceedingly rough; nevertheless this is a most deadly weapon. No rifle made by Purdey will carry its ball with more certainty than these. Each is sold for 31s. 8d. Two were manufactured especially for me by order of the director, with more care than is usually bestowed on them, and the barrels were made lighter and better stocked. One was a small bore, carrying balls, 64 to the pound; this was for feathered game and small animals; the other was a large bore, carrying 32 to the pound, for deer, stags, elks, wolves, bears or even the tiger. With both of these I could shoot with perfect accuracy, and I seldom failed procuring game for a dinner when once within range of bird or beast. These rifles cost complete, with cases and all the necessary apparatus, £4 15s.

Doubtless, breechloaders have long since been adopted, but as the necessity for economizing ammunition must still exist among the fur-hunters, a few details about the size of bore and charges of powder and lead would be interesting and also of service to those who intend exploring wild countries. Dr. Nansen, during his expedition toward the North Pole, used composite guns, having a .20 bore shot barrel and .36 rifle, which proved very effective.

J. J. MEYRICK.

DEVONSHIRE, England.

Preserves and Wild Lands.

Editor Forest and Stream:

The observations and contentions of Didymus and Mr. Raymond S. Spears, and the editorial in FOREST AND STREAM of July 4 about the game preserve deal with some matters that ought to be settled after while.

The property right in land cannot be questioned or meddled with without attacking the most fundamental privileges upheld by common law and the sentiments of civilized society. There cannot be much disagreement between doctors upon this subject, and FOREST AND STREAM's editorial, to be sound, had necessarily to trim the logic of two of its popular contributors.

An individual, a club, a company, or a corporation, without any doubt, may own property. The ownership of land can no more be questioned or interfered with than any most simple and clear right of man under the laws most universally sanctioned by society.

If an individual, a club or a corporation obtains legal title to a mountain or any other lot of land, trespassers upon that property are, and should be, subject to the same provisions that protect men in the occupation and use of any other private possession.

Men buy, fence, improve, and occupy wild land with the object of securing for their own whatever they find upon it of value. They often seek title to it for no other advantages than its natural features. It is often secured legitimately and honestly for its woods and streams, and for whatever exists in them, particularly the fish and game. In this land of freedom there is no law limiting the acquisition of property.

I agree with Didymus that no man or set of men should own more than 5,000 acres of wild, or any other kind of land, for that matter. I further agree with him, if he thinks so, that no man, or set of men, should own the railroads or more than a million dollars or so. If the latter provision could be arranged and legally enforced we would all have access to almost any place of recreation in the world.

With our constitutional rights and privileges as they are now, and as they have been since 1776, I am in favor of all the private preserves of wild land, and all the Government reservation of such land possible. When there is a better method of protecting some of the natural wilderness, and the fish and game of our country, I will be in favor of that.

In the region I am most familiar with, I have noticed that the wild land (and much of it is as wild as any in this country) is very much in need of private preservation or some other kind. With the vandalism of skin and pot-hunters and fishers, prospectors, miners, lumber and mill men, stockmen and campers upon Government lands, there is left upon them little susceptible of removal or destruction. A domain open to everybody is denuded of everything of value upon it just in proportion to the number of people that find it profitable to raid it. An area of wild or public land is denuded of its timber, its waters, and, of course, of its fish and game, just as soon as enough people have access to it.

State game, fish and forest protection, in thickly settled localities, may retard, but it does not prevent, the ultimate denudation of all the accessible public land and the diversion of all available waters. In thinly settled and remote localities game, fish and forest protection is rarely effected by State officials. California has a fish and game commission appointed by the Governor. Once in a while, it is alleged, it accomplishes the transplanting of some fish, or that it achieves the arrest of some conspicuous violator of the game laws in the cities. None of the waters of the State ever yield new fish, or an increased supply of native fishes, as far as is generally known; except that the lower portion of the Sacramento River and its sloughs have been enlivened with worthless carp and diminutive catfish not native to those waters.

The best streams in this region are diverted, dammed and dynamited whenever and wherever people find it profitable or convenient to do these things. A few weeks ago men were arrested for "dynamiting" fish in the Sacramento River near Redding. According to the local press the culprits were discharged from custody because the State had no funds at the disposal of the county for their prosecution.

The longest stream of this county has forty miles of its length cut off from the Sacramento into which it empties, by a dam that diverts all its waters in the late

summer months to a Chinese vegetable garden. The dam is impassable for fish at all seasons, clearly illegal, and a public nuisance, but it has been maintained for twenty years or more.

In this county of Shasta thousands of acres of timber and are burned over every summer by fires set by vandals of one kind or another, square miles of forest have been and are being denuded by smelting operations. Mining claims are located, the timber upon them cut and sold, and then the claims abandoned and others taken for the same purpose. There is no local power or any other to protest or prevent. If a few millionaires had some reserves in this region and fortified them against trespassers and vandals, I believe they would be a comparative blessing, and that the next generation would be thankful that they existed.

As I write a forest fire is burning in this vicinity. It has already burned for several miles over wild public lands. It is supposed to have started at a coal pit upon a mining claim. It followed a ridge along which there runs a ditch belonging to a mine that has been idle for years. Fearing a flume might take fire, a ditch-tender "backfired" and "let it get away," as is usually the case in the woods. It is safe to say that the fire has burned timber of more value than the two mines and all the flumes in the county, and it will doubtless continue burning for weeks, possibly for months. But forest fires in California on public lands attract little notice or attention. Nobody loses but the people.

As soon as a system of forest reservation was proposed for the Pacific Coast a small army of men that want everything wide open and free for all began active opposition to the measure. Stockmen want all the land wide open and free. Prospectors and mineral land locators want it open. All the small towns and communities want what the stockmen and miners want. A number of counties sent their attorneys to Washington at the expense of their citizens to work and protest against Government reserves. The mosquito fleet of country newspapers heralded the cry that the land was being reserved for timber grabbers, railroads and lumbermen.

As to private preserves and property rights in wild lands and woods, the man or men owning them should be commended for preserving some wilderness and its fish and game if they can. From my "point of view" they are entitled to their property, and I know of no reason why they should be delighted to have the public prey upon it any more than the people of our cities and towns delight in entertaining visiting strangers freely and without charge. There are things of value in a city street. Let a vandal help himself to a loaf of bread or a flower from a dooryard and he will at once realize the sacredness of private ownership. Are bread and flowers any more susceptible to ownership than land? If Didymus and Mr. Spears are too poor to own wild land and pine for want, some others of us, poor mortals that we are, may say we are too poor to own anything else! If we do have rightful, legal possession of wild land we hope and believe we are entitled to it. We grieve to pay taxes and build fences on public property.

From my "point of view" I am almost ready to begin to believe I think that it will be well to give the millionaires all the land. If we could only get them stuck with a few square miles of it for each one of them it would keep them so busy that others of us might get some of the other things they have. I will swap several hundred acres of mine for a yacht, and will let some of them fish and hunt and chop trees if they will let me in on tame city preserves. This is a fair proposal.

I believe sportsmen and lovers of the wilds are sometimes retrogressive in their tendencies, for they want to get back to conditions that no longer exist. They ought to be glad to hear of all sorts of game preserves and protection, parks, clubs, forest reserves, and anything but wide open public land. If there were more private reserves in the vicinity of our cities many people would be thankful if they could walk or ride through them, even though trespass signs were plentiful along the way. If that great cornfield, Illinois, had a wilderness of a hundred square miles in the middle of it full of bears and Indians it would be almost as beneficial to people as Chicago.

And so, with regret for the retrogressive tendencies of Didymus and Mr. Spears, I send you this breeze from the Sierras.

CHARLES L. PAIGE.

SHASTA, Cal., July.

Still Heathen.

DR. EUGENE P. DUNLAP, the oldest missionary in service in Siam, has recently visited the Province of Nakawn. The people were still heathen, as the following incident will show: A tiger had killed a buffalo and left his half eaten carcass in the jungle. The natives feared to slay the tiger, lest his spirit should punish them. So, as they said, "they made the tiger commit suicide." A path was cut to the jungle where lay the half eaten body. Stakes were driven on either side of the path, and two old-fashioned flint muskets were securely fastened to the stakes with the muzzles pointing across the path. A tight cord was drawn across from musket to musket and tied to the triggers. In the morning there was a dead tiger, and the natives cut his flesh for food to make them strong and to use as a preventive against smallpox, and crushed his bones to secure a powder as efficacious as the best patent medicine so freely advertised by the press in this land. The veteran missionary pleaded with the people to renounce such follies, but in vain.—New York Observer.

Blue Mountain Park.

MEMBERS of the family of the late Austin Corbin, of New York, have decided to practice forestry on the Blue Mountain Forest Park, near Newport, in Sullivan county, N. H., and have asked that a working plan for the management of the timber lands be prepared by the Bureau of Forestry. Alfred Akerman, an instructor in the Yale Forest School, with eight men, will be employed on the work during the summer.

The Blue Mountain Forest Park contains 25,000 acres, and is stocked with a variety of wild animals, including what is said to be the largest herd of pure-bred buffalo in this country. There are 128 head of the animals. Besides the buffalo, the park contains wild boar from Germany, elk, moose, and deer of several kinds.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

On the New Jersey Coast.

ASBURY PARK, N. J., July 17.—*Editor Forest and Stream:* It is extremely doubtful if the New Jersey coast has ever had so poor a season for striped bass as the present one; and it is regarded as practically over with the ending of June. While in ordinary seasons a few fish are taken from time to time during August and September, still June is always the prolific month, and with the craft little endeavor is made after that month, save when heavy easterly weather is on. I think twenty fish will cover the entire number taken at all the favorite points, which is a most remarkably poor showing.

One of 31¼ pounds is the record fish, to the credit of Uncle Billy Brumaker, who deserves the prize, as it is safe to assert that he has fished a day for each pound of fish.

Kingfish are fairly plentiful, and are fine in size—much above the average—but are biting but little, except early in the morning.

Weakfish are beginning to take the hook, and bite almost exclusively at night. As yet, however, they are quite small, the larger ones are not yet feeding inshore.

A cheering indication of what we have in store is the myriads of sand eels crowding in along the beach. If they continue with us we know that all varieties of fish will soon be present, as they are the bait fish par excellence, and are eagerly sought by all our fishes. Plaice, too, are unusually scarce, and those that do favor us with their presence are very small. In the streams where last year, and, in fact, for many years, I have taken 20 to 30 at a tide of the finest size, a couple, or, at most, 4 small fish, are the usual result. Why this is so, it is difficult to understand. Their food is abundant and tidal conditions are good; but the fish are absent. A most remarkable thing in relation to the weakfish has come to light, of the thousands that I have taken from the ocean and the different waters of this and other States, I never before took spawn-bearing fish. Of a catch I made a few evenings since 3 contained spawn. While the ova was far from mature, still it was well advanced in growth, and a friend, who was with me, tells me that two of his fish were in the same condition. It is just another "new thing" under the sun. Blackfish are unusually abundant, and some very large ones of 10 to 18 pounds have been taken from the beach south of Long Branch, at the outlet of Pakannasse Lake. They are hard, heavy fighters, but are not a strictly game fish. Some schools of bluefish have appeared along the beach at remote intervals, but not close enough in to be within the reach of rod and reel. The boatmen, however, have secured some, and they readily sell for 15 cents per pound when fresh from the water.

LEONARD HULIT.

Chat and Criticism.

CHARLESTOWN, N. H., July 14.—*Editor Forest and Stream:* The hot weather precludes physical exercise and reduces the mental activity to the amount necessary to read the papers, and make comments on their contents, and the last number of FOREST AND STREAM affords me an opportunity to "put in my oar" in one or two of the verbal contests which its contributors are always inviting.

In the first place the mysterious monster, to which your Seattle correspondent calls our attention, has, nothing mysterious about him, he is simply the well-known "thrasher," otherwise the fox shark *Carcharias vulpes*, mentioned in all books on ichthyology, and often by Arctic navigators. I read of him 70 years ago, I think in "Scoresby's Voyages," and have often seen him described. His tail is about half his whole length, and the upper lobe of it is very thick and heavy, and he uses this as a club, with which to attack the whales.

The second point which strikes me is the grammatical error in the title of the very interesting article heading, "Visits With Apes and Monkeys." You can pay a visit to an ape or monkey, or one of them might go with you to visit some other person, but visit means to go to see, and not examination or conversation, for the latter of which it has been often used lately by western writers, and the corruption is, I think, a "Chicagoism," as I note writers of that enterprising city speak of visiting with a person when they simply mean talking with them. The Latin origin of the word merely means "to see," as a doctor visits his patient, or a general the army posts under his command, but the preposition with is wrong.

The third point which has struck me lately, is the discussion now going on in your columns relating to game preserves, and here I am much inclined to take the side of the preserve owners. It is all very fine to rave about monopoly and exclusiveness, but we have got to remember that this continent is not very different from the rest of the world, and that the laws and customs which time has brought about in other countries, must be adopted here, as the growth of population and civilization fill up the once waste lands. When this country was first settled by the whites it was mainly an unbroken forest, and deer, turkeys, grouse and other game abounded everywhere, they formed the chief supply of animal food to the newcomers, and every one was free to kill them at his pleasure.

As the country became settled, the game was exterminated, and protective laws were passed, more than 100 years ago, but the habit still remained among the mass of the people, of shooting and fishing at their will, regardless of place or time.

The rapid disappearance of the game has led to more stringent laws in the last century, governing the times at which game may be taken, and the continued increase

of population, renders it necessary to put some restriction on places as well.

The old maxim, that "every man's house is his castle," covers the right to protect and preserve his property, and it is coming to be understood that the game raised on a man's land is as much his property as any of his other crops. The right of everybody to kill game everywhere has become extinct, as the land came into private ownership, and while it may seem undemocratic or unrepugnant, for any one person to own or control 20,000 or 30,000 acres of land, it must be considered that it is in most cases land unsuited for profitable agriculture, while eminently fitted for the shelter and support of wild animals, and that the "overflow" of those preserved on it will naturally stock quite a large neighborhood with sufficient game for reasonable sport.

I quite agree with Mr. Avis in his answer to Mr. Spears, and I do not agree with Mr. Spears that his woodsmen have any rights at all, beyond the property they own. It is merely the survival of the free and easy customs of the days when nobody owned the land, and it was, of course, open to all. Time and growth have changed the conditions, and altered the question, and the sooner we make up our minds to the inevitable the better for all concerned. While, as the learned judge says in the decision in the case you print, the game on the land of any man cannot be considered as his property until he reduces it to his possession, and it may leave his property at its will, for that of some one else, by fencing his land, he reduces that to his possession, with the game on it, as long as it remains there, and any entrance on that property in pursuit of it, is clearly an act of trespass, and may be so treated.

Now to another question. Your correspondent, Mr. Shurter, identifies the bloodhound with the old Talbot, in which I do not agree with him. I may be wrong, but I have always understood the Talbot to be the old English mastiff, and that the family of that name, which bore his semblance on their escutcheon, were so named from their tenacity "to grip and hold on" in the old fighting days of the Plantagenet Kings of England. Which came first and gave the name, I cannot say, "whether dog wagged the tail or the tail wagged the dog." Perhaps your Washington correspondent, Mr. Henry Talbot, may throw some light on this question.

Finally, and to close my growlings for this, I will go back a few months to a letter from Mr. Lodian, in which he claims that he discovered the process of making silk worm gut, and that he was sent to Spain by Mr. Marston for that purpose. Now he may have picked up a few minor details, as to the strength of the vinegar used, or the length of time of the immersion, but I have known generally how the gut was prepared ever since I first used it, nearly 70 years ago. I do not remember whether I got the information from Sir Humphrey Davy's "Salmonia," or Dr. Ure's dictionary of Arts and Manufactures, but I knew that the worm, when ripe and ready to spin, was immersed for a time in strong vinegar, then broken open, the silk bag taken out, and stretched on a board to dry, and the first gut I ever used, in the hank, as imported, showed the spiral curls at each end, where it had been wound round the pins, which kept it in place. Enough for to-day!

VON W.

Sacramento Trout.

SAN FRANCISCO, Cal.—*Editor Forest and Stream:* Last year I gave you a short account of my annual outing on the upper Sacramento River at La Moine, Shasta county. I again visited this lovely spot and my stay of ten days was replete with similar scenes. The grand old river was just as enticing, the rainbow and brown trout were as plentiful, and my short vacation came to an end too soon.

On my arrival I was met at the station by familiar faces. The genial landlord, Cliff Coggins, welcomed me most heartily, and the housekeeper, Mrs. Anderson, who loves to cater to the hungry fishermen, gave me a right royal good handshake and bade me welcome. I must not forget to mention Tom Kemper, known as "Missouri Tom," who is a character in himself, a whole-souled fellow, always ready to act as your guide. When he is engaged by other anglers he will honestly tell you the best pools and riffles and the flies he finds most successful. He is an all-right good fellow and knows the river like a book from Delta to Sims.

The best fly-fishing on this river is to be had from 5 to 8:30 evening, while fishermen who use a spoon, may have good fishing morning, noon and night. It is well, however, to rest in midday, and it is generally the time which anglers devote to writing to their wives, friends and sweethearts—and sportsmen always have some one to wish them luck and a safe return.

The manager of the lumber camp frequently invites his guests to go up to Camp No. 1, six miles distant, which is a most enjoyable trip. It is most interesting to see the monster logs shoot down the hill side, half a mile in half a minute. The active lumbermen handle the logs as they drop into the pond, and when a jam occurs it is wonderful to see how quickly they break it.

Colonel W. Kelichor was my fishing companion for my first trip, a sportsman of the old school, a thorough gentleman, and an angler of long and large experience. When leaving the hotel I was informed that the Onion Patch Pool was alive with quinnat salmon. I therefore took my casting rod along, hoping to hook on to a salmon, which I did on the second cast, and he proved to be a monster in size, the largest fish I ever hooked. My 7-ounce rod was worked as it never had been worked before, and for an hour and a half, under the careful supervision of the Colonel, I enjoyed the grandest sport it was ever my good fortune to get. The fish broke water a dozen times, and at no time during the first hour did he let up once, and I had from one to two hundred feet of line out. All things come to an end, and I got him, as I thought, completely under control, and was about to bring him to gaff when he gave one final effort to get away, and within ten feet of the shore threw himself on a rock and the hook broke. He had the utmost difficulty to get out of the shallow water back to the deep pool again. I might have attempted to take him with my hands, he was in such a weakened condition, but he put up such a great fight that I took my hat off to him and

said good-by. The Colonel was heart-broken at the loss of such a fighter as this fish had proven himself to be. He evidently communicated to his mates his miraculous escape, as I did not get another strike from a salmon in that pool. I had, however, excellent sport during the rest of my stay, principally fly-fishing, the trout ranging from a half pounder to one and three-quarters and one six pounder.

Slate Creek, which empties into the Sacramento River at this point, is a very prolific little stream and an ideal home for trout, with its high bluffs and immense boulders studded here and there continuously from its headwaters to its outlet. In the early part of the season when the Sacramento River is high and at times somewhat discolored, this creek affords excellent sport to the sturdy young angler, who cares not for the many impediments which beset him. A good creel is always obtainable. It is very swift and the fish taken are of good size, strong and great fighters.

There are always amusing incidents occurring when out on fishing trips, one of which will bear chronicling. A lady angler, wife of a well-known fisherman, was whipping in a sportsmanlike manner the rattle at the head of the Onion Patch Pool (by the way this particular pool was reserved for women and old men, being of easy access and only five minutes' walk from the hotel), when suddenly she stopped, and from where I stood, probably a hundred yards off, I saw that she had hooked a fish of goodly proportions, the largest she said she had ever hooked, and she has landed many a fish. But in this particular instance she unfortunately lost her usual presence of mind and essayed to hold the fish without allowing him to make a dash for liberty; of course her tackle gave way, and when I reached her she was in tears. Between her sobs she remarked, "If Will had only been here I would not have lost the fish." Will is one of our most successful fishermen with either spoon or fly; he is a great worker and never fails to fill his basket. Will and his wife spend their vacations at La Moine, and the many baskets of fish which he ships to his friends in the city testify to his prowess as an angler.

La Moine bids fair to become one of the principal resorts in California for anglers who want good fishing and good accommodations.

My stay was most pleasurable, and I again look forward to a similar outing in 1904.

JAMES WATT.

Fish and Fishing.

Salmon Fishermen Returning.

MANY of the American and Canadian salmon fishermen who were early upon their rivers have returned home, and notwithstanding the indifferent opening of the season most of them report satisfactory sport. There are still many fishermen on their streams at present writing, and the parties who take the second half of the fishing in certain waters have only recently gone into camp.

Messrs. Ivers Adams and Walter M. Brackett are still, at this date, upon their rivers, the Moisie and Ste. Marguerite, respectively, where the sport is yet at its height. The Restigouche and Cascapedia Salmon Clubs report a number of members still upon the pools. Some of them will go to Lake St. John for the ouananiche fishing, before returning home, and others will stay over for a time at Murray Bay, but the majority return directly home from the rivers. Mr. R. E. Plumb has already gone from the Natashquan, where his party enjoyed good sport, and the Messrs. Adams, Jr., of Boston, and Mr. Sampson, who was their guest, from the Moisie. Mr. Morton Paton of New York passed through Quebec on the 7th inst., from the Trinity, which he fished in company with Messrs. Edson Fitch and Vesey Boswell. This party has 109 fish to its record for the season. The sea trout were rather late this season at Trinity, so that the fishing for them was scarcely at its best when the party left the river. Trinity Bay offers about the best sea trout fishing to be found anywhere.

The Godbout is being fished by Messrs. John Manuel and nephew of Ottawa and Col. Whitehead and Mr. Law of Montreal. This remarkable river had yielded 348 salmon to four rods this year up to the 10th inst., and is still being fished. I recalled some of the remarkable scores made on the Godbout, when reading the boast made a few days ago by an English sportsman in Chambers' Journal. In this publication Mr. W. A. Sommerville reports the killing of 53 salmon by him in one week on the Corrib River in Galway. I was conversing with Mr. Napoleon Comeau, the well-known occasional correspondent of FOREST AND STREAM the other day, on the subject of scores, and he referred me to the fact that some years ago he had made the record catch of 57 salmon in one day on the Godbout. In three days of that season nearly 400 fish were killed by three rods in the river. Of course this fishing was merely to establish a record. The river is now practically swarming with fish. The early run this season made a good average in size. The present run yields an average of about ten pounds.

Speaking of numbers it is interesting to note that the yield of the nets at the mouth of the Moisie for one day this season was eight hundred fish. These nets have been so judiciously employed for the last half century or so that the angling in the Moisie now is as good as ever it was, thus illustrating what may be accomplished by a wise understanding between angling and netting interests and the close observance of prudent legislation, coupled with some scientific knowledge of the subject. It should be noted, too, that the Messrs. Holliday, who succeeded to their father's interests in the netting privilege of the Moisie many years ago, still maintain a hatchery on the river. I am forwarding this letter from the establishment at the mouth of the Moisie, which I hope to ascend to-day, returning with some practical experience at the "Anglers' Camp," eighteen miles up the river.

I find that besides shipping enormous quantities of fresh salmon from this and other North Shore streams to the American and Canadian markets, the Messrs. Holliday send large quantities of the split and salted

fish to Europe where the salt is partially extracted and the fish smoked ready for consumption. The process of preparing the fish for this market is a very interesting one, and Captain Sands of Denmark, an old ship captain, who has charge of it, tells me that the product of Scotch, Norwegian and other European rivers is now very far from sufficient to supply the German and Danish demands for salmon, and that the Copenhagen firm represented by him imports immense quantities of Pacific Coast as well as Atlantic Coast salmon for their European trade.

The Hollidays are not limited to the Moisie for their supply of salmon, but employ the iron coasting steamship "King Edward" in collecting the supply of fish netted at the mouths of the other North Shore streams. As this ship also carries the anglers who fish these northern waters, it may readily be imagined that its atmosphere is laden to overflowing with fishing stories. Its commander, Captain Picken, has sailed in every sea and has a good fund of his own.

Fishing for Swordfish.

One of Captain Picken's most interesting experiences was fishing for swordfish off the coast of Peru. The small craft used are birch-bark canoes, very much like those used by the North American Indians, but of larger size. The canoemen are also of Aztec or Indian origin. The fishing tackle consists of a harpoon four feet long, attached to about 130 fathoms of line. The fish float lazily on the surface of the warm placid water, apparently asleep, for the canoemen approach quite close to them before hurling the harpoon into them. Then the excitement begins. The fish darts down, but finding no relief, commences a series of wild rushes and giddy gyrations, now switching the boat sharply around and around, and now towing it with frightful velocity. Some hours are frequently occupied in killing one of these fish. That described by Captain Picken measured 19 feet in length.

The captain had naturally heard a great deal from the American anglers traveling on his ship of the sport afforded by the Lake St. John ouananiche, some of which seemed very much more incredible to him than many of his own stories. Yet none of them are unfamiliar to frequenters of those northern waters. So much stranger do the experiences of others appear to us than those of our own!

Messrs. Bayard Dominick and Dr. Smith and son of New York have gone home after enjoying excellent sport on the Mistassini, notwithstanding that they arrived on the river very late. This Mistassini, which is a salmon river on the north shore of the St. Lawrence, must not be confounded with the famous ouananiche river of the same name flowing into Lake St. John.

Pollution of Rivers.

There is very much cause for alarm in Canada over the subject of river pollution. The increased demand for pulp has led to a very large increase in the number of saw and pulp mills in the backwoods of the Dominion, and these are, very unfortunately, erected in many cases upon the banks of some of the best salmon and trout streams, and with an utter disregard of the law prohibiting the pollution of rivers. I know of salmon rivers which have been completely ruined in this manner. As an illustration of the extent to which this evil has grown, it is only necessary to refer to the last annual report of the late Mr. L. Z. Joncas, Government Superintendent of Fish and Game, addressed to the Minister at the head of the department. He states that upon the occasion of an official trip into the country north of Montreal for the purpose of observing how the law was obeyed, he found a very alarming state of things with reference to the future of the fisheries in that part of the Province. During the trip he visited thirty-nine mills and found that not only was there not a single one with a fishway, as required by law, but that all the mill owners deliberately threw the sawdust and other refuse from their mills into the discharges of the lakes and into the rivers, a condition of affairs which is bound to work the total ruin of the fisheries unless the proper remedy is at once applied.

[We have in hand and shall publish in our next issue a valuable report on certain investigations into the effects of sawdust on fish.]

Fishing Stories.

The present season's crop of fishing stories in this country promises to be outdone by that from the other side of the water. The Mr. Sommerville, whose experience in the Corrib River has been already referred to, tells of two salmon rising to him at the same time, and claims that he hooked them both.

An angler who was fishing the Avon, near Tomintoul, with a trout fly recently, says that he hooked a trout about three inches long which was instantly killed by a grilse of four pounds. Feeling an unexpected strain, and not aware of the incident, he worked gently to the side, and secured the grilse in his landing-net. Then the grilse let go its hold of the trout, which was still on the hook.

I was shown at Moisie, yesterday, a salmon fly with part of a broken cast attached, which had been taken out of a net in which salmon were captured, and was told that on previous occasions a salmon fly has been found attached to the mouth of netted salmon, all of which tends to prove that even so apparently slight an injury as a hook in the mouth sends the fish straight back to its hospital in salt water.

Last night I watched Mr. Holliday's men taking the salmon out of a net. Almost the third part of a fish of over twenty pounds weight was missing. It had been bitten clean away by a seal, while entangled in the meshes of the net.

E. T. D. CHAMBERS.

A consignment of 20,000 rainbow trout ova are en voyage from the hatchery of Mr. Moreton Frewen, Inishannon, County Cork, to Japan for exhibition at the Japan exhibition at Tokio in the coming summer. The ova were fertilized and then spread on muslin troughs covered with two inches of damp moss, the whole being hermetically sealed in a can. By the time the can completes its voyage, some 11,000 miles, the ova will be almost hatched out.—London Fishing Gazette.

Canoe and Camp Life Along the Delaware River.

XVII.—A Side Trip to a Trout Stream.—Fly-Casting a Saw Creek, Pennsylvania.

I'm just a jolly little trout!
Darting, flashing, leaping out
From my home beneath the bank,
Where the ferns grow tall and rank!
Ripples, shadows, dance and play
Through my pool both night and day.
King am I in this my nook;
Joyous in my forest brook.

—Soliloquy of the Brook Trout.

It is the mountain to the sea
That makes a messenger of me;
And lest I loiter on the way,
And lose what I am sent to say,
It sets my music to a song,
And bids me sing it all day long.
Farewell, for here the stream is slow,
And I have many a mile to go.

—Monologue of the Trout Brook.

My comrade has at last grown weary of the river. He sits here under the shadow of Mt. Minsi, and looks listlessly at the marvelous play of light through and under all the lines of silver palaces made by drifting cloud-masses, and at their shadows over the league-long hill-ranges, and their reflections in the deep, still water just where the Delaware breaks through the Water Gap. Yet he sees nothing, and voices his lack of interest:

"All very well; but I have had this sort of thing for

UNFENCED NATURE.

many weeks. I would not care to hear the finest orchestra forever. I am ashamed to fish any more for these bass. Had more than my share a month ago. I must go to town, or get further away from folks. Want it tamer or wilder."

"Where are your eyes and ears, man? All these wooded hills freshly washed, and a rainbow with one end vivid, and—"

"Ain't wild enough to suit me. Reef that smile; that widow is in Boston now; so I'm not going back to Narrowsburg. Going to town, unless you will go to Saw Creek with me at daylight to-morrow."

Useless to argue when his mind is "sot!" I know that the long-continued dry weather means only half the usual volume of water in the trout stream from which I brought away nearly two hundred beauties two years ago. The fish will see us and hide; the season is far advanced, the water too warm, and the trout are at the mouths of the spring rivulets. But I realize that the stream and its woods are singularly wild and attractive. And I should miss my comrade.

Five o'clock the next morning finds us leaving the Gap in a double-seated surrey behind fast steppers provided by host Johnson, of the Glenwood House at the Gap.

AFTER LUNCHEON.

We pass through that famous region of high hills and winding river, and on to Shoemaker, about twelve miles from the Gap. There we turn to the left, cross the Big Bushkill River, drive four miles into woods, and are at the Decker cottage on the bank of Saw Creek. Here is where the whippoorwill, male and female, sat on the fence two years ago and the female sang the well-known notes for five minutes, as mentioned in a former number of this series. The stream is roaring down through the woods, not ten rods back of the house. The feverish longing to hasten the jointing of the rods and the actual casting of flies, is strong upon us. We drive a half mile

READY FOR THE CAST.

further, to where "Bill" Counterman, the best fly-fisherman along this stream, sits on the doorstep of his tiny mountain dwelling, and regards us with a sarcastic grin. "Howdy! Ye don't say ye kum fur fish? No use; no water; they see ye!"

Then he talks of the land-owners along the creek having told him to keep off fishermen, to warn them of direful things if they cast flies here. For the first wish with him is to impress visitors with a sense of his importance. He has fished this brook, man and boy, during forty years of actual residence on its banks.

After what he considers a due amount of persuasion, he is induced, as he meant to be from the start, to fish for us, so we may not return to the Gap with not even one trout; for with his long, special knowledge of the haunts of the trout here, he can catch three of them while even a skillful angler who is a stranger to the stream, would get one.

He is shown our fly-books; and after finding fault with all the flies, and saying it is foolishness to use even the gray-drake and fox, which he praised at the same season two years ago, he selects a dozen of the best, and uses them in preference to his own, which he had announced were "specially made for me in Bosting, and the only fly 'at takes trout hyar."

This man is indeed a character, and we give him a picture. His hard, often almost destitute mountain life, has not shaken his courage, his faith in himself, his garrulous egotism. In his tiny house I have seen ten dollars' worth of fried trout piled high on his table to feed his nine children and himself and wife. He cuts hoop-poles and cord-wood in fall and winter, hauling them to Stroudsburg, twelve miles distant, and starting at four o'clock the coldest mornings. He raises a few bushels of buckwheat from a stony field. But his principal income is from summer trout-fishing for men who cannot catch trout themselves, or wish more trout than they are likely to get.

WATER-BREAK MADE BY A TROUT THAT HAS MISSED THE FLY.

A mixture of shrewdness and backwoods philosophy, easy in old clothes and rubber wading boots, full of reminiscence, knowing every rock along this stony and difficult brook, drawing a very long bow, and making a brave fight for himself and a great family, he is a picturesque backwoodsman, and a study for the most expert fly-casters. He fishes with one fly, and nearly always up stream.

"Fly acts more nat'ral; an' ther mud an' stuff ye stir up ain't goin' down under yer flies an' scarin' ther fish."

Long, long plodding through wildest woods where the boulders stick up through brown of fallen leaves and pine-needles and among laurel and rhododendron bushes, and we are at the cabin built by a fisherman of Philadel-

phia, who, with Mr. E. D. Hemingway, of that city, owns a fishing privilege along a mile or two of the stream. Here is a picture of our party at the cabin.

Flies were cast in vain. The writer lost four beauties during the day because they were hooked where it was impossible to secure them. Scarcely a foot of that whole rocky bed but has its pitfalls and difficulties of boulders, and submerged, fractured, sharp-edged rock—upended, sidewise, sloping—presenting a most treacherous and generally unseen foothold. Every step must be taken carefully—felt for. You go over a flat-rock three feet under the rushing water, feel its edge, and cautiously step off into water a foot deeper, where sloping edges of more rocks invite slipping and possible fracture of an ankle, and where the green water-algae add to the danger of a bad fall. And yet to wade in that stream is a great pleasure, for it is very beautiful, and contains exceptionally large trout. You do not know what moment you may be fastened to a large one, and have your work cut out for you. Glance at the accompanying illustration of just one vista along that brook, and you will understand. At the right stage of water it affords excellent trout fishing. Each pool and rapid is a picture. There is a delicious sense of real wildness. A single morning wade there will show you dozens of real wild birds, and not a single sparrow.

One of the Philadelphians who owns fishing rights there, is a rare combination of hard-headed business sense and enthusiastic nature-love. It is a great pleasure to hear him tell of his life along Saw Creek. He calls it "up there." I give the substance of one such talk; but I cannot reproduce the face and eyes lighted up with his love of it all:

"The camp-fire up there is a solace and a joy—the ally of dreams. The quails and thrushes and grouse all take you by surprise; swallows swimming in the wind, or a thornbush in blossom around a bend and holding nests of bluebirds and warblers. There the three joy-calls of the whippoorwill, and the 'passion of midsummer' in the throbbing boom of the nightjar, come unexpectedly in the

"BILL" COUNTERMAN.

windless, moonlighted silence. The whole thing is to me a kind of wild love-rainbow on a background of green. I know those brook-voices mighty well—sturdy at the falls, low-voiced medleys of song on rapids; and the woods are a harp of sighing under brave mountain winds. I wonder if you will understand when I say the stream's beauty and music are cousins to the beauty of the west wind in the emerald haze of the woods. I am a dreamer up there; but dreams are quite as much realities as rocks. I have known that whole region from boyhood. My early summers and springs were sweet with it; and they are lived over again when I get there. Those pines and hemlocks are my brothers and sisters. I know every note of the water. Even over in Philadelphia I sometimes hear it calling to me. Just last week I was up there in a glorious day; and the stream was one winding, moving dazzle, and dancing leaf-shadows. In that water and its music is the beauty of sorrow, the beauty of love and of life in the forest, the beauty of wildness, and of faith, and of wanderings and cadences of the harp, and there is friendship in the wind and wild flowers, and in the very pathless ways of the wild bees.

"That, sir, is what I call seeing. Now let me tell you about taking a blind man up there, a chap with eyes that could not see, and a heart that did not know. I had often told him what good times I had up there, even when I did not get a single trout. He is a prominent business man in a great city, a bank director, and with a keen eye for a dollar; but he cannot see a wild flower.

"Well, I drove that man up Saw Creek, all the way to the cabin. He had an idea that to catch trout, one merely had to sit on the bank and the trout would come and hook themselves; and that you could fill a creel that way in twenty minutes. I left him sitting on the bank, and went off to try for a fish or two, and came back with three small trout, and told him. His disgust at the poor fishing was immense. We had an excellent luncheon in that glorious, wild dining-room, after which he wanted to 'go home.'

"I went into the cabin and found that he had written in pencil over the doorway 'Nothing in Inferno can equal Saw Creek.' And I came out and looked across the valley to the mountain range where I had often been so happy with my gun and bird-dog. There was a fine summer wind, and the woods over there were roaring with pleasure, and cloud-shadows and sunshine were playing hide and seek over miles on miles of that long hillside. And I heard a red squirrel chickareeing on

top of the cabin, and went around and looked up at him; and he just jerked his tail and body, and said to me: 'Old man, you and I understand this thing up here; but that fellow is not one of us!' And before I thought I answered back right out loud: 'Right you are, little chap! and when I come up here next week he will not be along; but I shall bring you a quart of chestnuts, and I hope you will lunch with me!' And that fellow looked at me as if he thought I was crazy, and asked: 'What are you talking to?' And I drove that blind man out, and on the road I stopped where a quail was whistling on the fence; and this fellow asked: 'What are you stopping for, and what is that making a noise?' And over in Philadelphia at a club, he drank his coffee and smoked, and used his napkin and finger-bowl, and said to me: 'I look back on that god-forsaken country and wonder what under the heavens takes you there!' And I remembered the fifteen inch trout that I hooked in rapid water; the one that ran between my legs; and what a royal fight he gave me, and how handsome he was! I recalled the pool shown you now in this picture. See the ripple there—the splash in the water where a trout rose and missed my fly? And I mentally asked that city clubman: 'Which is the more god-forsaken, this club, or that stream and forest?' He will not go there with me again, for I now understand and shall remember that a fine adjunct on a pleasant trip up there is a congenial companion who is not blind and deaf."

Our party spent the day on the stream, and three rods secured only fourteen trout. But we caught and brought away much that we could not show, and that will attract us to the stream again. I want a photograph of the trespass sign three miles above, staring out from a thicket right beside the brook:

"No fishinher
Tresperzpersikotid."

There are about five miles of good fishing water that is open to the public below that sign. Dark flies like the brown-hackle, gray-drake and fox are the favorites.

How the pen lingers, trying to escape the closing of this series. The very last entries are made in our fishing journal.

Next week the final article of this series will mention some of the Indian history and tradition of the Delaware Valley. L. F. BROWN.

The Nepigon, Its Beauty and Its Trout.

O priceless memories! peerless days!
Pinioned with flowers; O forest life!
Oft will my lyre in gladness raise
Song to those shades with rapture rife,
Far from the world's wild, weary strife!
—Street.

THE halo of romance and mystery that once upon a time hovered about the North Shore of Lake Superior, has vanished before the dawn of civilization.

The whistle of the steamer re-echoes now from its lofty cliffs and caverns, once sacred to the voices of the winds and waves. The charm of Silver Island has faded away like the mirage of the lost islets, since it has been despoiled of its hidden treasure. Giant waves from off the angry lake still seek refuge within the cavern of the Grand Portal and clash against its rocky dome, mingling their thunderous reverberations with the awful voice of the storm. The Pictured Rocks, that often conceal their treacherous features beneath a veil of fog, the shroud of many a gallant sailor and his craft, still retain all their pristine beauty. But gone forever is the wild weird charm that once enveloped them. That dread demon of the Chippewas, Keeweenaw, who thrusts his giant arm seventy miles out into Gitchee Gammee, has been shorn of his mystery and copper. Relics of a hoary past have been unearthed, showing that elfins or mound builders delved beneath its surface ages ago. The air throbs to the music of falling waters. Pre-eminent among its beautiful cascades is Silver, that leaps from a dizzy precipice into the willing embrace of Superior. Lovely trout still disport in its fairy caverns, safe from the prying eyes of the Indian netter, who robs the north shore of its finny treasures, to tickle the palates of the gourmands of the Lake cities. Fly-fishing in the rivers and off the rocks is not what it used to be, despite the efforts of interested parties to re-vamp its waning glories.

Among the multitude of streams and rivers that empty into the lake are many that contain trout. Take the Steel, Jack Pine, Michipioten, the Indian water way to Hudson's Bay, all were once the chosen haunt of great speckled trout. To-day not one of them can live up to its past reputation. But there is one river that still presents a defiant front to the destructive forces that have swept into oblivion many a lovely trout water; this is the noble Nepigon, the peer of them all. The speckled trout of this incomparable river attain such monstrous proportions as to completely overshadow the product of such waters as the Steel, Mink, Gravel and others. Long ago when the Canadian Pacific was but as the vague dream of an enthusiast, when an occasional steamer or sailing craft was the only link that bound the North Shore to civilization, a few choice angling spiritss drifted in to Red Rock, then a lonely Hudson's Bay post at the mouth of the river.

As the few scattered rain drops heralded the storm, so these early pioneers proved to be the forerunners of a mighty host. How they must have reveled in this region of enchanting delights. The Nepigon, like an untutored child of nature, was easily beguiled of its treasures. The wildest dreams of the angler could be realized in those halcyon days when every pool and rapids was thronged with huge primitive trout that sprang aloft, again and again, in their eagerness to seize the gaudy cheat. The pool near the railroad bridge, now silent and deserted, was the chosen resort of a select coterie of anglers, whose hearts sang with boyish delight as they cast their flies upon its troubled waters and landed trout that rivaled the giants of the Rangeleys. The fame of the wonderful river soon spread like wild fire throughout Canada and the States, causing many to make the pilgrimage to the Promised Land, eager to secure the cream of the sport. At that

time the Rangeleys and many of the old-time resorts were on the wane. This helped recruit the ranks of the elect and deplete the lower river. This led many adventurous anglers to desert the old places, and seek happier regions above. Anglers from far and near now began to invade this fly-fishers' paradise. They fell upon the choicest places, between Lake Helen and the landing, and lo! they were not. The river above Alexandria Bay still continued to honor the drafts made upon it, while the rapids far below chanted the sad refrain of departed glory. The resources of the noble river were soon to be severely taxed, like a sinuous serpent; the railroad entered this Eden of trout, bringing an overwhelming army of anglers in its train. All that saved it now from utter annihilation was its two mighty feeders, Lakes Nepigon and Superior. The merciless flogging the river now received from the forest of rods that were turned loose upon it soon began to have effect. The larger trout gradually became suspicious of the clever imitations of insect life that drifted about on the surface. The fly-fishing was now at its best, from an expert's point of view. The smaller fish of two pounds or better could still be taken in reasonable numbers, but to deceive one of these giants of the flood with the mocking imitation of a dying insect was a feat that any angler could refer to with honorable pride. Comparatively few can do the trick at this late day. These cold northern waters are apt to warm up a trifle under the ardent gaze of that fiery luminary, who reigns triumphant during the brief Canadian summer, scorching sportsmen and vegetation alike. Occasional showers offset his fervid rays and cool the waters to a delightful temperature, presenting the watchful angler with golden opportunities to score the last half of June, and from August 10 to September 15 represent the pick of the season. The sportsman who comes here in July must chance it on passing showers for fish to fill up his creel. It is an off month everywhere for trout.

Many anglers came utterly unprepared to cope with the changed conditions that confront them, often equipped with tackle that is pie to these monsters of the deep pools and rapids, particularly fly-rods that their owners lack the ingenuity to convert to bait purposes. It is useless to apply to the Indian guides, as most of them know little or nothing about the ways of the scientific angler, and care less. He is the only man that has a fighting chance to conquer these finny giants, not the native fisher, with his primitive methods that worked well enough in the past, when half the catch could be lost, yet enough saved for present needs. There is no such comfortable margin of luck now on the river. Off days occur quite frequently, when for some unknown reason the trout refuse the most tempting offers. Therefore it behooves the expert angler to be ever on the watch and play the game for all it is worth, otherwise he is likely to retire to camp, accompanied by the proverbial fisherman's luck. Scientific angling is the best and only way to success with large trout, so here goes to enlighten the tyro, who is willing to adopt the up-to-date methods that prevail on the Nepigon and other places resorted to by knowing ones.

Tackle that is good enough for the Adirondacks and the greater portion of the Maine woods will not answer here. Split bamboo is elegant material for a rod, but is too costly and frail for the tyro's use, lancewood, Bethabara and greenheart will stand far more rough treatment than split bamboo. I have had considerable experience with Bethabara and strongly recommend it. A fly-rod of this material, weighing from 8 to 9 ounces and about 10½ feet in length, is the thing for the Nepigon, or wherever the trout run large. It should have a spare tip 3 or 4 inches in length to fit into the upper point; this converts your fly-rod into a serviceable bait-rod. You can utilize a broken fly-tip for this purpose, by trimming it down and replacing the ring tip. If the ring is round, heat it a trifle and press it to a pear shape. This will allow the line to slip off instead of catching below the top. A good multiplier is not amiss, but the feather light or expert reel, with back sliding click, will take up line very fast, and can be relied on to meet every emergency. Use fly-hooks, not coarse cheap ones. Cheap hooks, flies and rods are a snare and a delusion on the Nepigon; 4-0 Shaughnessy or 6 Sproat will give you an idea of the size. Salmon leaders and flies will give superb service, but are very expensive. A six-foot leader, mist-colored, adapted for heavy black bass, is strong enough for most situations. Have several sizes of ringed sinkers. The most useful is about the size of a .32 caliber bullet. Split shot often come handy. A good way to rig up is to fasten one end of the sinker to the reel line, the other ring to a three-foot leader, or you can divide a six-foot leader and attach the ends to the ringed sinker; it's practically the same. In either case use swivel sinkers or snelled hooks, swivels for trolling are likely to strip, avoid them; the best plan is to use flatted or knobbed hooks. Four or five half hitches of gut well soaked in warm water, make a fastening that defies removal, and is easily renewed when the gut gets worn at the head of the hook. Flies tied in the old style are apt to strip, particularly if old. When worn by frequent casting the gut cannot be replaced. I tie my own flies on flatted hooks. It is impossible to strip them; they are tied to use with a sliding loop. Worn gut can be cut out and loop renewed in one minute, insuring a sound leader. I have used this fastening on the Nepigon, in the Big Fish Lake region and other parts of eastern and northwest Maine. It never fails. It will send in a full account of it if sufficient interest is manifested. A tapered or level fly-line rather heavy, of braided silk or linen, at least 50 yards, better 65; and a large ringed landing net, say 30 inches deep, with a mesh fine enough to entertain minnows. A creel is handy, but not indispensable, as your guide will take care of your catch.

Now for a brief chat about flies, dark ones are of little use on account of the depth of water. Large, light-colored flies are more apt to be seen—variations of yellow, green and red, with plenty of white or light yellow in the wings. Parmachenee-belle, royal-coachman, orange and white moths are all good examples. Small flies are best for brook fishing. Flies on flatted hooks are not on sale, the next best are flies on needle-eyed hooks.

The would-be angler is now pretty well equipped with everything necessary save experience; he will get that fast enough when he appears on the river, especially the bit-tr sweet variety. The reader who desires to know more about this romantic region, its beauty and its trout, will

find much to interest him in a trip I made to the Nepigon last season, about the middle of August.

At the little Nepigon station I met the genial fishery overseer, William McKirdy. The village boasts of two stores, a country hotel and a church. McKirdy furnishes complete outfits. I found Joe Salt, the head guide, busy packing up. After making a few purchases, including license, we departed for the landing, followed by the curious gaze of the natives. Here we found the canoe in charge of the younger guide. It was getting toward sunset when the birch glided out on to Lake Helen. The next morning we entered the sluggish current of the river. Clearings show up on both banks. At frequent intervals a few half-breed families have settled down, striving to wrest a rather precarious living by raising hay, potatoes, and a few hardy vegetables from the stony soil. We passed by a very comfortable cabin deserted by its owner on account of its lonely situation. Frequently the troubled waters suggested trout, but probably harbored pike and togue. As we drew near Alexandria Bay, a lovely cascade sprang from the dense forest on the left bank, laughing in silvery tones as it leaped from rock to rock. The brook above contains trout; its source is a pond stocked with black bass; it is seldom visited, and no doubt harbors some heavy weights. As the sweet voice of this wild woods beauty died away in the distance, the white water of Long Rapids shot into view, finding a resting place on the broad bosom of Alexandria Bay. This beautiful bay and rapids are embalmed in the blessed memory that hovers about the good old Nepigon days. The swift water between Lake Jessie and the bay holds many a three-pounder, but the giants that used to disport in Long Rapids have vanished forever. The pool at the foot of the upper rapids is one of the best stands on the river for fly-fishing; it holds many trout of two pounds or better. Cameron's Pool, a little further down, is a "has been" now, but was once a famous rallying place for the old timers. The little rivulet that races across the portage road shelters many trout.

Here the guides deposited the canoe and camp stuff and awaited the coming of the team. It would be a charming place to camp for a few days, and pry into the secrets of the brook, late in the season, when insect life is on the wane. I shall never forget the old angler that I met by the brook side; he used a cane to prop his failing strength; time had withered his countenance but failed to touch the boyish heart. He crowed forth a hilarious welcome to Pat, the eccentric driver of the carry team, as he rushed down the steep incline, surrounded by a halo of black flies. This merry disciple of Walton was one of a little band of anglers who interested me greatly, as, with one exception, they were all graybeards. They assured me of a good time ahead, provided I did not encounter a run of hard luck. Black flies swarmed in multitudinous numbers on the carry; it is a fly purgatory in August, and no mistake. Pat must exist in a chronic state of martyrdom most of the season. Let us draw a veil over the scene.

Early next morning our canoe glided out on to the placid surface of the lake that mirrored only the passing clouds and voyageurs. This is one of five sister lakes that, like a string of pearls, connect Lake Nepigon with Lake Superior. Here the tortured waters of the chute gains a brief respite before joining in the wild strife below. Immense pike lurk in its depths, occasionally leaving them to foray in the troubled waters where trout abound. Comparatively few anglers take advantage of the good run of smaller sized fish that abound in Long Rapids, and the Narrows that connect Lake Jessie with Lake Maria. Many-knights of the fly rod go further and fare worse. This haven of dreamy rest and peace is soon exchanged for the turbulent strife of contending waters. At Split Rock the mad flight of the river is checked between lofty cliffs of basalt. This portage and island a short distance above are trilling, but every carry necessitates unloading the birch to the ribs. The guides then carry it across and bestow it with the greatest care in the water. Sometimes evergreen boughs are placed at the landing to prevent chafing. Leaks are a constant source of trouble, particularly with old canoes. The carries are the life of the river; here people of every grade of society are encountered. The blasé frequenter of fashionable resorts joins forces with the bored millionaire in the search for a new sensation. Here the young tyro, to whom mere existence is a joy, rubs elbows with old veterans wise in fish lore, who often condescend to give points to the tenderfoot that stand him in good stead when he flashes his maiden rod on the pools above. I was fortunate in making the acquaintance of an old timer on one of these thoroughfares who had camped on the river in the palmy days of fly-fishing. He drew a mournful contrast between the present and the past, and lamented the decadence of fly-fishing at Virgin Falls. The experienced anglers could be easily singled out from among the motley crowd who jostled one another for precedence on the river, by the way they handled their tools; many of them had grown gray in the pursuit. The fly-rod often worked wonders in such hands, bringing captive to the net many a trout of such noble proportions as to be worthy of the attentions of the half-breed artists. The knowing ones work the best places for all they are worth by using both flies and minnows. Occasionally an inveterate fly crank puts in an appearance. These followers of old Izaak (a long way off) detest the ways of the bait-fisher, and spurn his advice. They are often appropriately rewarded with a light creel and a heavy heart.

A few miles above Island Portage we drew near to a famous collection of pools, among which Hamilton's is prominent. Avoiding the wild output from Hamilton's Pool, we fetched up at the foot of Pine Portage, and pitched out tent about midway on the carry, where the river broadens out into an immense pool that holds many a goodly trout. Here I whiled away many a happy hour casting into some whirling eddy, or where, amidst thunder and foam, lurked giant trout. Flies that would have scored in northeast Maine failed to draw except among the smaller sizes. At times I spiced my life with excitement and danger by running the wild Robinson Rapids; with a good head of water on it roars like some monster, threatening to crush the frail birch between its rocky jaws, while great masses of water leap upward from impact with the rocks and fall with a thunderous slap, like the tails of a thousand beavers. The canoe soon feels the

mighty suction of the torrent and quickens its pace. The Indians gaze about with an air of grim confidence, and carefully take their bearings, knowing that sharp rocks lie in wait ambushed in foam or masked beneath the treacherous surface. A broken paddle staff or a marked deviation from the slippery route is to court destruction to the birch and its occupants. The canoe hesitates tremblingly on the verge, then, abandoning itself to the irresistible force of the current, like an arrow shot from the bow flies down the watery slope, the shouts of the guides smothered in the appalling din of clashing forces. I often took these risky chances to gain a coveted fly-pocket between the upper and lower rapids. Here in this sheltered spot I cast the gaudy fly, but failed to meet with any marked success, while scarce a hand's breadth away the lower rapids tossed their white arms aloft, the only exit to the pool below. Stately forests of pine and hardwood encroached on the river, softening the hard contours of rocks, resplendent in the warm glow of the setting sun. They present a smiling contrast to the grim face of the granite cliffs.

Life at Pine Portage is a merry round of piscatorial pleasure, and backwoods comfort. The wrinkled front of care relaxes before the boyish pranks and jests that are wafted about the camp-fire, often as irresponsible as the sparks that fly upward. Here all are boys again, though many have heads as white as foam. Occasionally a smart Alec struts upon the scene, thereby adding to the gaiety of the situation. He speedily becomes the butt of the camp, and a victim to all sorts of practical jokes on land and water. He jeers at scientific bait-fishing and gazes with contempt on the whippy fly-rod and delicate leader; he proposes to use strong tackle and accomplish his purpose as the Irishman played on the fiddle—by main strength. Deaf to well meant advice, but primed with brazen assurance, fooled by conceit, he embarks for some happy haunt of the anglers, armed with a rod about as resilient as a poker, amid the ill-concealed merriment of the elect, who see his finish. His braided line is fine and strong, the hook about the right size, the rig will pass muster in rough water, and would render good service in master hands, barring the rod. Presently his guide points out a likely spot. Ker-slosh! goes minnow and sinker, and quickly disappears beneath the surface. The bait is fresh and tempting and soon attracts the attention of a magnificent fish. There is a slight pull on the tautened line, his strike is quickly responded to by a jerk that nearly plucks the rod from his grasp and sends the line flying back in his face, minus the business end of the hook. He gazes at the faithless steel with a rueful cast of countenance and soon hitches fast another. But 'tis not a cheap one. He braces up and makes another bid for piscatorial honors and finds an easy mark in a two-pounder. This hard-hooked lightweight is quickly disposed of. A larger one that would have fallen an easy victim to the fly-rod, jerked loose. This beggarly showing caused him no little alarm, as twilight was about due. The evening's entertainment was wound up by an encounter between this know-it-all and an old hook jaw. The minnow in its travels invaded the territory of an old battle-scarred vet, wise in fly lore, but ready to immolate himself on a hook deftly concealed in minnow or angle-worm. After a careful inspection he closed with the tempting offer, and promptly put up the fight of his life. Warned by past failures, the excited fisherman made an effort to ease off his furious rushes by surrendering line. But playing a monstrous trout is an art in itself that requires considerable practice and skill. The old fellow got any quantity of slack line and dead pull, but it availed him not. Jerks and wild plunges that lashed the water into foam failed to free him from his tormentor. He now allowed himself to be towed within a few yards of the waiting net; the fisherman smiles in anticipatory triumph, and grasps his reel firmly, not gingerly like an experienced angler. It looks to be all over, except the shouting. But there's many a slip betwixt the net and the fish. Suddenly, without an instant's warning, six pounds of fin and fury cleaves the air, his mad flight arrested by the rigid rod and line, a cruel jerk that rends delicate ligaments, sends the hook flying from his lacerated jaw; he strikes the surface and before the horrified gaze of the chump disappears with a sound like a rock cast into the water. Darkness precludes any further attempts. Mournfully the fisherman returns to camp to receive the mock condolences of some, sour looks from others, whose sport he has helped spoil by his crude methods.

This flight of fancy is founded on fact, as witness the following: One of my Indians fastened to four trout at Long Rapids and lost them all by jerking off, despite the assistance of a steel fly-rod. Instead of giving line he depended on the spring of the rod. They were hooked well and good, and could probably all have been saved if properly played. Occasionally a big one is hooked hard on strong tackle, his capture then becomes a certainty unless the hook breaks or tears out. But many escape with torn and lacerated mouths and bodies to become so suspicious and cunning as often to balk the best efforts of the most skillful anglers. This cruel and wasteful method of angling should be prohibited, as it often reduces the sport to a minimum on many of the best pools. The angler that flies to the other extreme and banks on a featherweight rod and cobweb leader will have his hopes and tackle demolished at one fell swoop.

Crowds of men, women and children, along with guides loaded down with camp paraphernalia, come and go at Pine Portage, the liveliest place on the river. The amount of baggage and style that some parties unload on the Nepigon is ridiculous. The chill air of exclusiveness that pervades the camp repels comradery. These worthies soon discover that the worship of Mammon and that of woodland beauty are incompatible. Their gold helps smooth their path, but fails to gain them access to the inner court of nature; eyes they have, and they see not; ears, and they hear not; the sweet song of the rivulet receives no encore. Beautiful wild flowers that peep shyly out at them from the crevices of the rocks exist unnoticed or else are trampled remorselessly beneath their feet in their aimless wanderings. They preempt the best pools, and between them and their army of guides kill and mutilate any quantity of trout. They often spoil the joy of the true angler without adding to their own. The novelty of the situation soon evaporates. They linger for a while in a state of elegant boredom, and then depart to more congenial climes. This class of pleasure seekers

and drones is most heartily detested by the faithful followers of old Izaak, among whom may be numbered many of the shining lights of art, literature and science. These wise men avoid the pretentious resorts of fashion and folly, and repair to camp beneath the woodland's shade, where they revel in flannel, trout, and the care-free life of the forest, to emerge in a month or so ruddy with health and vigor.

W. C. SQUIER.

[TO BE CONCLUDED.]

CHICAGO AND THE WEST.

Fishing on the Michigan Pine.

CHICAGO, Ill., July 18.—Mr. Wm. T. Church, who was of a party of Chicago anglers who last week made a camping trip on the Pine River of Michigan, is kind enough to send me the following account of the proceedings. Others of the party show confirmatory enthusiasm, and the feeling seems to be among the Chicago visitors that this beautiful river is one very much worth revisiting. It is a typical Michigan sand-bottomed stream with deep water and big fish, and regarding it, Mr. Church goes on to say:

"Ten miles from the station of Tustin, under the leadership of John Waddell, ably seconded by Col. E. C. Fox and Mr. Shelby, all of Grand Rapids, the party went into camp on the banks of as beautiful a trout stream as ever flowed. That so large a number of anglers could find fishing waters within reach of a fixed camp may occasion surprise. But the Pine River is so tortuous in its windings that many miles of water may be fished within walking distance of any chosen point. By dividing the party one-half to the waters up stream and the other down stream from camp, and having the fishermen enter the river at different points, each found ample space.

"The fontinalis predominate in this stream; a very few grayling are still found there; and the rainbows, which have been introduced, are taken in varying numbers on every day. During the first three days of the outing the fish were rising slowly under a bright, clear sky and warm sun. Enough fell to every rod, however, to more than supply the camp, and on the fourth day some very fine catches were made. Up-stream, from the camp, the river flows through green timber, over-arching the waters so as to almost exclude the sun, then through a broad meadow, where the fly may be cast from either bank. The bottom is sandy, with but few gravelly riffles, and with many clay holes. These latter are of a peculiar formation. The hard, white, slippery clay, which supports the sandhills, has been laid bare, and by the action of the waters dug out, leaving deep, shelving pools, favorite hiding places for the old lunkers, but full of danger to the wading fly-caster. Mr. Chadwick, of the Chicago contingent, had the idea that he could go through these holes with his waders on, and had opportunity to demonstrate his ability. A sloping boulder at the upper edge of one hole pitched him head first into a deep blue pool framed in smooth white clay. He did not tarry to measure its depth, but clutching his rod and net ploughed through the cold current 75 feet to shallow water. When overtaken by his fishing partner, he was bailing out his waders, and calling for something warmer than sunshine.

"Our camp was located near a bridge in a little used road. For seven miles down stream the river is one succession of rocky riffles and sandy-bottomed pools. There are no long runs, but bend follows bend with a high sand bluff on one side and a low wooded point on the other. At the July stage of the water this portion of the river is ideal.

The river is fed by springs and spring brooks from its source to its mouth. In places groups of three to six large springs may be found. Good camping sites abound. Running the river in a light boat is exciting and pleasurable. Throughout its entire course the water is sufficiently free to afford easy casting. The large fish are there to invite patience and skill, while some of the smaller fontinalis are colored as brilliantly as Mexican opals. A few of this species have learned from the rainbow to leap from the water as well as to fight in it.

"The writer's experience on this river began in 1896, when with a single companion he drifted it from Luther to its mouth. These days on its head waters have confirmed the impressions then formed that spite of its rapids and dangerous holes it is a delightful stream for fly-fishing.

"The members of the Chicago Fly-Casting Club, who had the good fortune to enjoy the late trip, were Fred. N. Peet, H. G. Hascall, I. H. Bellows, A. C. Smith, Chas. Antoine, C. H. Chadwick and Wm. T. Church. Mr. Hascall was so much pleased with the stream that he chose to remain after the camp broke up, and he is there for a large part of his vacation. John Waddell has again shown himself a master in conducting a party as well as in the tournament, and on the stream. It is a pleasure to record of him that he had the largest catch, the largest individual trout and the biggest bunch of gratitude of any man of the party."

Mr. Waddell's largest fontinalis was 13½ pounds, others had several fish over 1 pound. All these trout are of bright green back color, and very silvery beneath. In these cold waters they fight very hard. The Chicago men think the Pine of Michigan a very sporting water.

Chicago Bass Fishers.

Among good catches of recent date is that made by Mr. H. Bush, Chas. Sweeter and their friends, Messrs. Hull and Brooks, who took 100 bass in their late trip to Burlington, Wis. They did not fish in Brown Lake, which is near that town, but visited Wind Lake and Long Lake. Wind Lake is a sandy-shored proposition, without much cover for bass, and they did not do much in this water, but caught most of their fish in Long Lake. They describe their treatment at their Burlington stopping place as very kind, and intend to go back there at an early date. This Long Lake near

Burlington, Wis., is not to be confused with Long Lake, Ill., which is another water much patronized by Chicago bass fishermen.

On his last week end trip Mr. W. J. Benson, of this city, fishing in the old and very much hammered water known as Cedar Lake, near Lake Villa, Ill., caught the big-mouths on the run, and landed 26 fine ones during one afternoon. This is one of the best individual catches of the season.

Mr. Chas. Lawrence of this city, with one friend, this week fished Como Lake, on the Chicago & Northwestern Railroad, and in one-half day's fishing they took an even 50 bass between them. Theirs was one of the most fortunate boats on any bass water in this vicinity during the present summer.

Mr. S. O. Wade, of Chillicothe, Ill., fishing with some friends on the Illinois River last week, took some two or three dozen nice bass, and Mr. Wade says that that part of the country is much overlooked by Chicago bass fishermen, who might do very much worse than explore the prolific waters of the Illinois River and its adjacent lakes and bayous.

Mr. H. W. Perce and party of this city leaves this afternoon for Long Lake, Ill., where they have a tip which they think is going to be interesting.

Mr. H. A. Bowman, also of Chicago, leaves to-day with a friend or two for Fox Lake, Ill., for two or three days' fishing.

Tarpon Talk.

There are apparently few Chicago anglers who know a great deal about tarpon fishing, hence considerable interest attached to the mounted specimens of tarpon brought to town this week by Messrs. Oswald Von Lengerke and C. H. Lester, whose trip to Aransas Pass received earlier mention in these columns. Both of these fish show a small dark hole through the lower jaw, where the hook bit through. Mr. Von Lengerke, speaking to-day of his experience in tarpon fishing, said that it was nearly always the case that a fish striking with the point of the hook against the bony part of the upper jaw would be pretty sure to get away. The lower jaw hold is much the safest of any, and a fish hooked in this jaw with the point and barb going on through, is pretty safe to be landed. Mr. Von Lengerke showed several hooks of the strongest bronze twisted, broken and bent by the jaws of this giant herring. The upper jaw of the tarpon is very blunt and is covered by the strong and projecting lower jaw. A man who hits one of these big fellows on a trolling line and hooks him fair, has got his own business cut out for him. The fish brought up by Mr. Lester and Mr. Von Lengerke are not record fish in the sense of being extraordinarily large. I think they were not weighed, but they approach the 6-foot mark, and both fish are very thick, stocky and well shaped, there being a great difference in the specimens taken in the Aransas Pass country. Mr. Von Lengerke thinks that this sport is bound to meet with greater and greater favor among Western fishers and is anxious to try it again himself.

Light and Dark Muscallunge Waters.

Judge H. W. Lincoln, of Ottawa, Ill., is a muscallunge fisher of wide experience, and every season takes an extended trip to some part of Wisconsin. In conversation with Judge Lincoln this week he mentioned a few points on muscallunge fishing which I do not hear commonly spoken of among our anglers.

"I go very much into the Minocqua country of Wisconsin for my muscallunge fishing," said he, "and as you know, this is not very far from the Flambeau Indian Reservation. Now the Indians do not fish for bass very much, nor do they angle even by trolling for muscallunge to any great extent. Their favorite way of taking the muscallunge is with the spear, and as they have practiced this little game for a generation or so up there, they have thinned out these fish in a great many of the better lakes. I don't need to point out that in a clear-water lake a spearsman can work to a great deal better advantage than in a dark or stained water. As you know, a great many of these Wisconsin waters are nearly copper color with the stain of the tamarack roots. The Turtle Lake waters, for instance, are very dark. At the same time a great many muscallunge are taken in the Turtle Lake country. Now when I want to get a muscallunge, I don't go to one of the sandy or clear lakes. I hunt up a dark-water lake, and here, when the weather conditions are right, I nearly always succeed in taking a good muscallunge. Last year I found a little lake about thirty miles from the railroad, and was lucky enough to take a 34-pound muscallunge there, with several others over 20 pounds. If you want to get muscallunge don't go to the clear-water lakes, and, of course, don't go to the much-fished waters and to those which are easily accessible from the railroads."

"It is the same way in regard to bass fishing," said Judge Lincoln, though not for the same reason. "If you want to get small-mouth bass don't go to the dark or stained waters. Keep to the bright lakes, those with sandy bottoms. Here is where you will get your fly-fishing for small-mouth bass. As an instance, I would mention Swamp Lake, some dozen miles or so northwest of Minocqua, where I have had very good fishing for small-mouth bass. On the other hand, if I wanted to take big-mouth bass I would stick to the dark-colored waters with mud bottoms, and water lilies and the like growing around the edges. For myself I troll for bass with a little single hook spoon and a bait. Some of my friends cast for muscallunge with a sucker or other large bait, but my own fishing has been mostly done by trolling."

There is much of apparent reason in what Judge Lincoln says, and in any case his advice is the expression of an angler of many years' experience. This distinction between the bright and stained waters might save a man quite a trip over a wilderness road into a country with which one's guide is not fully acquainted.

After 'Lunge.

Mr. John O'Neill, of the City Hall, and a party of

his veteran friends, leave to-morrow for another muscallunge trip in the vicinity of Minocqua, Wis. This is the same party with whom Mayor Harrison frequently goes for muscallunge, but I understand the Mayor is not to be with them on this trip. They nearly always have good luck with the 'lunge.

Back From Vacation.

I presume there are few busier men in this country or in the entire world than Mr. James J. Hill, president of the Great Northern Railroad and a national figure in many other great enterprises. In spite of his many colossal interests Mr. Hill finds time to take his vacation every summer like any good American, and even makes it longer than the conventional two weeks. Yesterday he returned from a stay of a month on the New England and Northeastern Canadian coast, where he has been engaged in yachting and fishing. Mr. Hill has a salmon river and knows how to enjoy that and other opportunities for out-door sport.

ASHLAND BLOCK, Chicago, Ill.

That Mysterious Monster.

ST. JOHN'S, Newfoundland.—*Editor Forest and Stream*: Col. H. Barkdull, in *FOREST AND STREAM* of July 11, describes a mysterious monster that he saw attacking a whale near Admiralty Island, Alaska. His description is very like that of the thrasher, familiar to all Newfoundland fishermen. It is a common sight on this coast to see a whale attacked by a thrasher in conjunction with his ally, the swordfish. The latter gets under the whale and keeps him on the surface by prodding him with his formidable "sword," the thrasher meantime thrashes him with a large fan-like fin, and the noise can be heard for miles. If the whale can elude the swordfish and sink beneath the surface he is safe, if not he often perishes from the results of the attack.

This is such a common sight on our coast that I hesitate to advance it as a solution of the mystery surrounding Mr. Barkdull's monster, but from his description I am almost sure it is the same.

However, I advance this explanation till a better one is forthcoming.

NEWFOUNDLANDER.

THE description of "the mysterious monster" might appear to fit that of the thrasher shark (*Alopias vulpes*), but the authorities say that the thrasher does not attack the whale. Says the *Standard Natural History*: "It is a migratory shark, but its migrations are dependent upon the shoals of mackerel, menhaden, herring or other fish on which it feeds. When feeding it uses the long tail in splashing the surface of the water, while it swims in gradually decreasing circles round a shoal of fishes which are thus kept crowded together, falling an easy prey to their enemy. Statements that it has been seen to attack whales and other large cetaceans rest upon erroneous observations."

In the Fisheries and Fishery Industries of the United States, *Natural History of Aquatic Animals*, Dr. G. Brown Goode wrote: "The tales which are current regarding the ferocious attacks of these sharks upon whales are apparently without foundation."

In the same volume is given the following account of the killer whale or orcas; which may be the creature about which Mr. Barkdull wrote:

The killer whales are known the world over by their destructive and savage habits. Although their strength and speed render it almost impossible to capture them, they are of importance to the fisherman as enemies of all large sea animals, often putting them to flight at inconvenient times. The Atlantic species, *Orca gladiator* (Bonnaterre) Gill, was first brought to notice in 1671 in Martens' "Voyage to Spitzbergen." It is often seen on the New England coast in summer, driving before it schools of the blackfish or other small whales; it is a special enemy of the tunny or horse mackerel. Captain Atwood tells of the consternation shown by these enormous fishes when a number of them have gathered in Provincetown Harbor and the killers come in. They are a great annoyance to the Cape Cod people when they are trying to drive a school of blackfish ashore, and on the other hand often drive these ashore when they would not be accessible to the fishermen. They prey largely, too, upon the white whale in northern seas. In the Pacific there are two species at least, the low-finned killer, *Orca atra* Cope, and the high-finned killer, *Orca rectipinna*. The latter, though rarely more than twenty feet long, has an enormous dagger-shaped fin, six feet high, upon its back, which towers above the surface when the animal swims high. In fact the killer whales all have these high back-fins, by which they may be recognized at any distance.

Captain Scammon, in his "Marine Mammals of the Northwestern Coast," gives a long account of their habits, and of their fierce attacks upon the largest whales. The stories of the combats of the swordfish and the thrasher shark upon whales have probably originated in such combats as these, witnessed at a distance and imperfectly understood. Captain Scammon writes: "The attacks of these wolves of the ocean upon their gigantic prey may be likened in some respects to a pack of hounds holding the stricken deer at bay. They cluster about the animal's head, some of their number breaching over it while others seize it by the lips and haul the bleeding monster under water; and when captured, should the mouth be open, they eat out its tongue. We saw an attack made by three killers upon a cow whale and her calf in a lagoon on the coast of Lower California, in the spring of 1858. The whale was of the California gray species, and her young was grown to three times the bulk of the largest killers engaged in the contest, which lasted for an hour or more. They made alternate assaults upon the old whale and her offspring, finally killing the latter, which sunk to the bottom, where the water was five fathoms deep. During the struggle, the mother became nearly exhausted, having received several deep wounds about the throat and lips. As soon as their prize had settled to the bottom, the three orcas descended, bringing up large pieces of flesh in their mouths, which they devoured after coming to the surface. While gorging themselves in this

wise the old whale made her escape, leaving a track of gory water behind."

Instances are given where whales which had been killed by whalers and were being towed to the ship have been forcibly carried away by bands of killers. They are also obnoxious as destroyers of the young fur seal, and often remain for a long time in the vicinity of the seal islands. Eschricht says that thirteen porpoises and fourteen seals were found in the stomach of an Atlantic killer, sixteen feet in length. They are particularly abundant in the bays and sounds of British Columbia and Alaska, in search of seals and porpoises feeding there upon small fish. They even attack the full-grown walrus and rob it of its young.

A Good Catch.

Theresa, N. Y., July 17.—*Editor Forest and Stream:* I saw a good string of fish last Monday, when oarsman Dave Tyler (who had been rowing Mr. Justus O'Hara, of Syracuse, on Indian River and Red Lake) dropped the catch on the sidewalk in front of the Getman House. There were eleven black bass and, I think, seven or eight pickerel (pike). I did not count the latter, as I do not consider them worth counting. Afterward I saw the whole string on the scales and noticed that they weighed 65 pounds. I asked the oarsman to remove the bass from the chain and weigh them separate. He did so, and I saw that they weighed 34 pounds. There were ten large-mouth and one small-mouth, the latter not over two pounds.

I arrived here a week ago last Tuesday evening. The next evening at 8 o'clock a party of six young people (of which I was one) started down the river for Red Lake. It was moonlight, cool and pleasant after the hot day spent in the village. There were three boats. I rowed one, and was the first to enter the lake, and when about the middle we waited twenty minutes for the others, as we did not have the key to the cottage, which is about seven miles from the village by water and about half that distance by land, but ninety-nine times more rough even in a good strong wind.

We spent three delightful days on the lake, and did not know there was any hot weather in New York until we read it in Saturday's paper. We left the cottage at 7 o'clock Saturday evening. As we were about going into the outlet we passed Mr. O'Hara, the angler who caught the bass I saw on Monday, between that time and Monday noon.

Since writing the above, our next door neighbor showed me a catch of 35 brook trout taken this morning at Newton Falls, which is three hours' ride from here by railroad.

J. L. DAVISON.

Wire for Tarpon Snells.

KANSAS CITY, July 6.—*Editor Forest and Stream:* For some time I have been promising your readers to find and notify them concerning an ideal wire for tarpon snells, and now I think I have discovered one. It is phosphor-bronze No. 55 of the brown and short drill gauge. It is half-hard, and it takes eight feet to make one ounce. I have received a supply of this wire and have made one snell. It works nicely under the pliers, and is of just the right weight and diameter. It is said that salt water has no injurious effects upon it, so I think it is exactly what I have been looking for so long.

Unfortunately, I shall be unable to do any tarpon fishing this summer, as my work will take me soon to British Columbia, where, by the way, I expect to repeat my last summer's experience with the rainbow trout and to catch still bigger ones and more of them, as I am now acquainted with the locality. On this account I have sent a snell and some extra wires to my friend, the Rev. Father O'Dwyer, of Kansas City, who is now at Aransas Pass, and have asked him to give the wire a thorough trial and report the result to me. As soon as I hear from him I shall notify you. The only possibility of failure for this wire, in my opinion, is by breakage in the bends, but I do not anticipate this.

J. A. L. WADDELL.

Nebraska Fishermen.

OMAHA, Neb.—United States Judge W. H. Munger and Clerk George H. Thummell are at the Red Squirrel's Nest, Lake Washington, and report fine bass casting. The Judge landed a beauty weighing 6½ pounds, and Thummell one a half pound less. Will Webber has returned from Lake Winnibegoshish and enviroing region, where he has been muscallunge hunting for three weeks. He made a great catch, including a 32-pound great northern pike. Wilber Fawcett and bride are encamped for the summer in the woods on the shores of Webb Lake, Minn., the greatest black bass waters in the country. Mr. Fawcett has leased the deer hunters' log cabin belonging to Guide Edward Kapp, and fitted it up in charming style. He and Mrs. Fawcett will remain in the woods until October, and expect to canoe and tramp over a large portion of that wild country before the leaves begin to fall. In September Judge Charles Ogden and S. G. V. Griswold will be the guests of Mr. and Mrs. Fawcett for several days. W. D. Townsend, the gun store man, has received an order for 45,000 loaded shells for the Big Injun shoot at Lake Okoboji, Wednesday, Thursday and Friday, the last week in August.

SANDY GRISWOLD.

Delaware River Bass Fishing.

AFTER a visit to Narrowsburg, N. Y., in quest of bass, one can easily understand the necessity that caused the New York Legislature a few years ago to pass a law regulating the number of bass to be taken in one day by one boat. My recent experience at Narrowsburg was to put in the time on the water and take care not to break the law. The taking of 24 small-mouthed black bass to the rod, or 36 to the boat, will not work anyone overtime. The bass are there, and they make a pretty fight in that fast, clear water. Riffles, eddies, pools and rapids all yield up these gamy treasures. Fly-rods, bait-rods, boat-rods and bean poles are used, as well as good balance and good sense in shooting the rapids.

Mr. J. G. Guthrie, of the Arlington Hotel, will furnish the angler with bait, boat and guides.

Narrowsburg is in Sullivan county, New York, and is reached by the Erie.

T. E. BATTEN.

The Texas Tarpon Record.

Mr. W. B. Young, of New York, sends us the following scores of tarpon fishing at Tarpon, Texas, for two days, June 20 and 21. As will be noted, the total for the two days taken by Mr. Wainwright makes an extraordinary catch. The scores are:

Saturday, June 20—J. R. Wainwright, Pittsburg, 11; W. B. Leach, Palestine, 5; R. H. Foot, Weatherford, 2; B. M. Rich, Houston, 1; Otto Taub, Houston, 1; E. A. Black, Temple, 8; Mrs. E. A. Black, Temple, 1; Mrs. E. D. Staggs, Palestine, 1; E. D. Staggs, Palestine, 2. Total, 32.

Saturday, June 21—J. R. Wainwright, Pittsburg, 14; E. A. Black, Temple, 7; R. H. Foot, Weatherford, 5; E. D. Staggs, Palestine, 14; W. B. Leach, Palestine, 6; B. M. Rich, Houston, 1; Otto Taub, Houston, 1; H. M. Greene, Dallas, 1; J. E. Cotter, Tarpon, 18. Total, 67.

It is an unwritten law, a gentlemen's agreement, here that all fish shall be beached and then returned alive. The scores here then do not represent fish killed; many of the fish thus taken and released at Tarpon have been tagged with the metal tags supplied by Mr. Young, reading: "Report to FOREST AND STREAM."

Sullivan County Black Bass.

At White Lake, Sullivan county, N. Y., on July 11, Mr. Chas. Monroe took a black bass of 7 pounds 2 ounces. The fish was caught at 10:30 P. M. near the Kauneonga Inn at last end of lake.

The Kennel.

Fixtures.

Oct. 6-9.—Danbury, Conn., Agricultural Society's show.
Nov. 3-6.—New York.—Annual show of Ladies' Kennel Association of America.
Nov. 9.—Fourteenth annual beagle trials of the National Beagle Club of America. Charles R. Stevenson, Sec'y.

The Bloodhound.

THE following excerpts, taken from "Modern Dogs," by Mr. Rawdon B. Lee, the famous English authority on all breeds of dogs, is of special interest in itself, and when considered in connection with the discussion on bloodhounds, which has recently been held in our columns. Mr. Lee states that:

The origin of the bloodhound cannot be traced with any degree of satisfaction, but we believe that no modern breed of dog is so like that progenitor of his that may have lived three or four hundred years ago, as is this well-favored variety. Although repeatedly used as a cross to improve the olfactory organs, and the size and strength of other hounds, especially of the otterhound, he has always had admirers, who kept him for his own sake—because of his handsome and noble appearance, because he was a good watch and guard, and because he bore a vulgar character for ferocity not attained by any other dog.

The name "bloodhound," or sleuth hound, had something to do with this, and he always bore the reputation of being able to find a man, be he thief or otherwise, by scent, and either run him to ground, as it were, or bring him to bay in such a manner as to make his capture speedy. He does this without biting or worrying his "human chase" in the manner writers have often told us he was in the habit of doing.

The natural instinct of this hound is rather to hunt man than beast. As a puppy he may put his nose to the ground and fumble out the line of any pedestrian who has just passed along the road. Other dogs will, as a rule, commence by hunting their master, the bloodhound finds his nose by hunting a stranger. There are old records of his being repeatedly used for the latter purpose, whether the quarry to be found were a murderer or poacher, or maybe only some poor gentleman or nobleman whose politics or religion was not quite in conformity with that of those bigots who happened to be placed over him.

Early in the seventeenth century, when the Moss-troopers (but a polite name for Scottish robbers) invested the border counties of Cumberland, Northumberland and Westmoreland, it was found that the ordinary means of arrest and punishment were insufficient to stop the raids of the thieves, so special provision was made that should, if possible, put an end to their depredations. The Scots were fleet of foot and active, and it was believed that the employment of bloodhounds would strike terror into the hearts of the marauders. The latter were to be pursued "with hot fragrant delect, with red hand (as the Scots termed it), with hound, and horn, and voice." Surely such a hunt as this would be exciting enough, and the hard-visaged borderers would have little compunction in allowing their hounds to give full vent to their savagery.

Dame Juliana Berners, writing in her "Book of St. Albans," published in 1486, does not appear to mention the bloodhound, or sleuth hound, but the Lemor or Lymer is no doubt the same dog, and so called because it ran the line of scent, and not, as it has been asserted, because it was the custom to run it in a leash. Dr. Keyes (1570) mentions them as having lips of large size, and ears of no small length. The learned doctor tells us how these hounds ought to be chained up in the daytime in dark places, so that they become bolder and more courageous in following the felon in the "solitary hours of darkness." He likewise describes them as being run in a leash which is held in the hand of the man in charge of the dogs. This was to enable the huntsman, shall I call him, to be up with the hounds when his services would be required. It seems from the same writer, that, in addition to hunting the footsteps of the felon, these dogs were also trained to hunt the cattle that might have been stolen, a purpose for which he says they were much used on the borders. This may have been so or not, most likely the latter, for a drove of stolen cattle would be easy enough to track without the aid of a keen scenting "slough dog," though he might be able to be of

assistance, should the thief be ambitious to try the strength and powers of his would-be captor.

From that period down to the present time, the bloodhound was mostly kept as a companion, and only occasionally has he been trained to "man-hunting," to the terror of the poacher and the evil-doer. For the latter purpose, he has repeatedly proved of great service, and many stories are told of the extraordinary power a skillful hound may possess, in its faculty for sticking to the old scent, however it may have been crossed and re-crossed by either man or beast. Colonel Huldman mentions the capture of some poachers through the instrumentality of bloodhounds, who hunted the men fully for five miles from the plantation in which they were committing their depredations. Another case is mentioned, where a sheep-stealer was discovered by similar means, though the hound was not laid on the man's track until his scent was at least six hours old. Another hound is said to have hunted for twenty miles a fellow who was suspected of having cut off the ears of one of his former master's horses, and the scoundrel was captured and treated according to his deserts.

Captain Powell, writing in 1892 on the convicts of Florida (London: Gay and Bird), gives some interesting information as to the dogs used there in tracking such criminals as may attempt to escape. He says that, although bloodhounds were first used, they were found quite useless, and at the present time foxhounds were used for man-hunting in all the southern convict camps. These hounds are trained when young to follow the track of a man who is sent to run a few miles through the woods; and there is no difficulty whatever in so training them. Indeed, the author tells us that he has had hounds that were "natural man-hunters." He gives an instance where some puppies he was carrying at the time a convict tried to escape were put on his trail, and followed it until he was captured. Captain Powell corroborates what I have already written, that it is a popular error to suppose that hounds attack a prisoner when they run up upon him. When once the man is brought to bay, they are a great deal too wary to venture close enough to their chase to run the risk of a blow; in fact, they merely act as guides to the men who follow closely on horseback.

Some six years or so ago, at Warwick, in 1886, an attempt was made to hold trials of bloodhounds in connection with the dog show held there. These were, however, a failure, excepting so far as they afforded an inducement to owners of the variety to give a little time and trouble to working their favorites, which hitherto had only been kept for fancy purposes. A little later, similar meetings were held at Dublin, in the grounds of the Alexandra Palace, London, and elsewhere, but in no case could they be called very successful.

I had the good fortune to be present at two particularly interesting gatherings, that took place during the wintry weather of January, 1889, and, maybe, the following particulars, written at the time, give a better idea of the modern capabilities of bloodhounds than could be written now. It must be noted that the hounds mentioned were of the so-called prize strains, were "show dogs" in the modern acceptance of the term, and, excepting perhaps in ferocity, they would no doubt compare favorably with any hounds of the kind that lived fifty, a hundred, or more years ago.

Readers will no doubt be aware that, about 1889 and a little earlier, considerable commotion had been caused in the metropolis by the perpetration of some terrible crimes. The police arrangements were quite futile, and the murderers still remain at large. The attention of the authorities was drawn to the fact, that bloodhounds might be of use to them in such a case. Mr. Hood Wright offered the loan of his hound Hector, but, owing to the fact that he required some indemnity in case his dog was killed or injured, Hector remained at home.

Mr. E. Brough was then communicated with, and he brought from Scarborough to London a couple of his hounds, when they had several "rehearsals" in St. James's Park, where they acquitted themselves to the satisfaction of the Chief Commissioner of Police; but it may be said, that, though repeatedly the line of scent was crossed by a strange foot, without throwing off the hound, when the same was done in the streets and on the pavement, hounds were quite at fault. Indeed, to be useful in tracking criminals in a town, very special training would be needed, and, personally, I believe that bloodhounds, even with that training, would be useless in our large centers for police purposes.

Under fair conditions any bloodhound will, in a few lessons, run the trail of a man a mile or two, or more, whose start may vary from ten minutes or a quarter of an hour, or longer. Some of the more practiced hounds can hunt the scent even though it be an hour old, and we know that a couple of Mr. Brough's bloodhounds, early one summer's morning, hunted for a considerable distance the footsteps of a man who had gone along the road eight hours before.

This is, of course, exceptional, but, with a proper course of training during three or four generations, there is no reason to doubt that bloodhounds would be able to reliably make out the trail of a man who had gone three or four hours previously—so long, of course, as his footsteps have not been crossed and recrossed by others, or foiled in any other way.

That hounds will ever be got to track a criminal, or anyone else, on the cold, damp flags continually passed over by pedestrians, as in the streets of London and other large towns, no one who understands them will believe. Such work they never have done, and never will do; nor do the owners themselves aspire to such excellence for their favorites. In country districts they may be of aid, but in towns, so far as appearances are at present, the apprehension of criminals must be left to the mental sagacity of the official biped.

Bloodhounds might be of use in smelling out any secreted article or a man in hiding; but an equally well-trained retriever, or even terrier or poodle, would do this description of work equally well.

The bloodhound stands alone among all the canine race in his fondness for hunting the footsteps of a

stranger; any dog will hunt those of his master or of someone he knows, and of a stranger, probably, whose shoes are soaked in some stinking preparation to leave a scent behind. The bloodhound requires nothing but the so-called "clean shoe," and, once lay him on the track, he hunts it as a foxhound would the fox, or the harrier or beagle the hare.

To proceed with the following description of man-hunting with bloodhounds:

The storm of Sunday had passed, and how deep the snow lay in the streets and in the country places on the Monday, are now a matter of history. The air was keen and sharp, made so by a brisk north wind which blew on the Monday morning, when we left Euston Station for Boxmoor, where we were to see two couples of Mr. Brough's bloodhounds run in the open country without assistance of any kind, and under any conditions which might prevail at the time. Surely the surroundings could not well have been more unfavorable unless a rapid thaw, immediately following the snow, had made them so. At Boxmoor the country was thoroughly white. The snow lay on the ground to an uniform depth of about eight inches; where it had drifted, occasionally we were almost up to our knees. For a time the sky was fairly bright, but later a blinding shower of snow fell, which happily cleared off in about an hour's time. At our terminus we were joined by Mr. Holmes Pegler, who brought with him a dog hound named Danger, by Maltravers out of Blossom. This hound a few generations back can claim some of the old southern hound blood; but he shows not the slightest trace of this, being a good-looking black and tan animal, though not in the best of form, so far as health is concerned. He had very little preliminary training, and thus afforded fair evidence of what a bloodhound will do under adverse circumstances. Our small party—which included, in addition to the gentlemen already mentioned, three ladies in a sleigh, Dr. Philpot, and Mr. W. K. Taunton—made the best way along the lanes to the Downs, and, ascended them, on to the Sheep Hanger Common. Toward the summit we found ourselves on one side of a pretty valley, which even under its wintry garb looked quite charming, and afforded some idea of the beauty of the locality when summer blooms. However, before quite reaching the hilltop it was decided to give Danger a trial.

A man was selected for the purpose, and the course he had to run was pointed out to him. The thickly lying snow made locomotion very difficult, and as even now there came a recurrence of the storm, a comparatively short start was given. In seven minutes from the time the man had set off, Danger was laid on his track, and, picking up the line in an instant, went away at a quick rate along the hillside. We tried to run with the hound, but to do this in the deep snow and keep Danger in sight was impossible. After following him some 600 yards or so, we had to make our way to the tiny knot of spectators on the hilltop, and once there saw that he had lost the line, after running it well for something less than half a mile. In making a cast around, he unfortunately struck the wind of the spectators, and came back to them. Nor did he seem very persevering in attempting to regain the scent, giving us the idea that in previous trials he had not been allowed to depend upon his own exertions to recover a lost trail.

Mr. Brough's hounds included Barnaby (one of the couple brought to London at the instance of the late Commissioner of Police), and Beeswing, with Belhus and Blueberry, their offspring. The two first named are well-known hounds on the show bench. Barnaby had run at the Warwick trials; the younger animals are fairly good looking, and their work was quite satisfactory. Blueberry was afforded the next trial, a stranger to him acting as the quarry, taking a course down the hill over sundry fences, making one side of a circle, a distance of about a mile. After eight minutes' law the hound was unleashed, and had no difficulty in hitting the line, though snow was falling heavily. She carried it along at a good pace, quite mute, and, a little at a loss at one fence in the hollow, cast well around, refound the line, and, without more ado, ran it up to the man.

At one portion of this trial a laborer crossed the track, but the bitch stuck to her line, and was not thrown out for a moment. Without resting, the two couples of the Scarborough hounds had a quarry provided in Dr. Philpot. For some distance he made his way along the hillside, through scrub and stunted bushes, down to a hedge at the foot of the vale. Here there was a road, and, crossing this and a fence, the quarry made up a bare field to a plantation. Skirting the wood for 300 yards, another fence was reached, across this, along some bare ground, by the side of another hedge, to the foot of the hill where we stood. No better view of such a trial could be had. This course was quite a mile. As the four hounds were to start, they were slipped ten minutes after their quarry had gone. Barnaby, a little slow in commencing, was not long behind, and, with a fresh and cheerful burst of music, the little pack raced along at an extraordinary pace, considering the depth of the snow. A little hesitancy in the bottom, and Barnaby cast forward a little, had "it" again, "his wife and children" flew to his note, and away they rattled up to the plantation.

The old dog's size and strength were useful in this deep going, and he led the way; but scent must have been good, for, without losing it again, they raced down the hill, and fairly caught their man before he re-ascended from the valley. A good trial in every way.

Possibly the prettiest hunt of the day was afforded by Beeswing and Danger, with Master Pegler to be hunted, and a ten minutes' start given him. These hounds did not at the first hit off the line, but, when fairly on the track, went through the scrub, down the hill to the foot road, and over the fence without a check. Some nice work was done in the bare field, especially where the quarry struck off at a sharp angle, and along by the fence of the plantation. They had no difficulty in making out the whole of the course, which we would take to be about three-quarters of a mile.

The final trial was run by the entire two couples and

a half of hounds, and, with fifteen minutes' law to the quarry. Now that the snow had ceased, the pack quickly went along the right line down the hill and over the first fence. In the middle of the second field, some quarter of a mile from the start, Danger seemed at a loss, and, turning back to his owner, who was following as fast as the deep snow would admit, somewhat disconcerted the other hounds, as they turned round to the voice of Mr. Pegler, who called his hound up. Higher up the field Beeswing appeared to be the one that struck the scent again, her voice attracting her kennel companions, who rattled along the correct track up to a hedge which lay to the left. The quarry had skirted this boundary line, and made his way down hill to a couple of hay stacks, or, at any rate, stacks of some kind. He had doubled along the road here, but hounds found him without the slightest difficulty.

As all hunting and shooting men know, scent is one of the mysteries of nature. Here we were out on a day when one might reasonably expect that hounds would be unable to run a hundred yards without a check. Still, all these bloodhounds, with their quarry given from seven to fifteen minutes' start, hit the line, and took it along at a "racing pace," it may be called, when the ten or eight inches of snow are taken into consideration. The keen north wind, too, must have been against scent, and one of the best trials of all was run in a blinding snowstorm. Surely, then, these bloodhounds have olfactory powers of more than average excellence; at any rate, that Monday they proved to us their possession of such. The men who acted as quarry had no knowledge of these hounds, no strongly smelling concoctions were smeared over their boots; and, indeed, they had been standing over the shoe tops in snow during the whole of the time the trials were taking place. So the "clean shoe" must in the end have been sadly water soaked. These bloodhounds did all we expected them to do, even more, and we are quite prepared to see the same hounds, under more favorable circumstances, hunt a man's trail or footsteps, though they be two hours old. Running singly, each hound was mute; together they gave tongue, and their voices were very fine. It may be interesting to state that, in their earlier training, all Mr. Brough's hounds ran silently, whether hunting together or separately; but, working them with a noisy basset, they were tempted or encouraged to throw their voices, as they now do when hunting in company.

The trials arranged by the Kennel Club were advertised to take place on the race course adjoining the Alexandra Palace, on Wednesday morning, at 10:30. As it happened, when that hour was reached, the only one of the three judges present was Colonel Starkie, who a little later was joined by Lord Alfred Fitzroy. Then snow began to fall, few of the stewards were in the dog show, and the prospects seemed to favor an abandonment of the trials altogether. Up to 11:30 o'clock nothing had been decided upon, so Mr. Craven, with his couple of entered hounds, went home. Next it was officially stated that a decision would be come to at twenty minutes to one, when it was resolved to hold the trials. The snow had by this time given place to rain; a cold, chilly wind blew from the southwest; and these combinations, with the addition of the wet, damp ground, upon which old snow lay three inches or more in depth, made the surroundings of these trials as unfavorable as they well could be.

Mr. Lindsay Hogg, in addition to the gentlemen already named, judged, but the duties were almost sinecures. Several tracks had been marked out by small flags, and, although these courses were said to be 600 yards in length, they appeared considerably more—probably that distance straight away, with the run home additional. Each hound was allowed a track of his own, which extended along the race course for several hundred yards on the flat, over sundry lots of railings, winding round in the direction of a small plantation. The hounds had to pass this, and then enter the road on the run home.

The latter portion of the track was along the same line by each man who acted as the quarry, thus making the trials more difficult tests for the hound; though those that ran first must necessarily have had the advantage, as the latter part of the road was less foiled by one or two men than it would have been by half a dozen. Two stakes were provided, the one for the "clean boot," the other for the "not clean boot." The latter in this instance meant that the shoe soles of the man acting as quarry had been rubbed with horse flesh, the only material at hand for the purpose. As a fact, the second stake never ought to have been arranged, and it is by no means to the credit of a bloodhound that he should require such assistance; the status of the trials was thus reduced to the commonplace "hound dog" trials, so popular in the rural districts of the North of England. As matters progressed, the bloodhounds actually hunted the clean boot better than they did the soiled one, and we would suggest that in future, when the "not clean boot" is to be run, terriers rather than bloodhounds should be utilized for the work.

However, in due course one of the keepers out of the show was despatched as quarry, with a start of ten minutes, during which time he traversed more than three-fourths of the course. Then the first hound, Mr. B. C. Knowles's Koodoo, was slipped. He struck the line immediately, but lost it after going about a hundred yards, and, casting round, struck the wind of some of the spectators, and, failing to persevere, was called up.

Mr. W. J. Scott's Hebe III., a smart bitch, likewise picked up the line quickly, and, running it a little too much to windward, was at a loss for a moment. She cast well, and without assistance struck the scent, and kept it until she turned the corner at the plantation and out of sight of the spectators. For a time Hebe tried to regain the lost line, and looked like doing so until catching the wind of a laborer, and rather startling him by making his passing acquaintance. She failed to finish her task.

Mr. R. Hood Wright's well-known Hector II., who had performed well at the trials in the grounds of Warwick Castle two years before, and now nearly eight years old, was, after the stipulated five minutes, put upon the line. He did not start with so much dash as

the bitch had done, carried his head nearer the ground, and ran the exact line the quarry had taken. This he did well, and the manner in which he leaped those railings the man had climbed, and ran under those he had crept through, interested the spectators not a little. There was no mistake as to the correctness of his nose up to the plantation; but here, where the quarry had turned, the hound was at fault. He cast about till striking the line again, and was hard on the track of the man on turning into the road home. This he stuck to until near the goal, when he became somewhat disconcerted, no doubt striking the wind of the crowd as he approached them. His trial was very well run.

Mrs. Danger's Jaff was absent, and Mr. E. Brough's Blueberry strangely refused to run, though what we saw of her work on Monday proves her an excellent bitch, and her owner considered her about his best. Mr. Brough's Barnaby, mentioned earlier on, went quicker along the line the runner had taken than Hector had done, and, like him, cleared or went under the railings according to the mode the quarry had adopted. Just before reaching the plantation Barnaby lost the scent, but cast to the right and left until it was struck again. He, too, was a considerable time out of sight behind the plantation, but on reappearing in the road he was running the line of the man, which he continued much as Mr. Wright's hound had done, failing to quite come up to the winning post for similar reasons.

Dr. Hales Parry's Primate was absent, so the end of the stake was reached, there being four of the nine entries that failed to meet their engagement. The judges awarded the prizes as follows: First, Mr. R. H. Wright's Hector II.; second, Mr. E. Brough's Barnaby; third, Mr. W. J. Scott's Hebe III.; the fourth, of course, being withheld. There was little to choose between the first two, for both ran excellent trials, considering the unfavorable surroundings, and afforded ample proof, even to the incredulous, that the bloodhound will hunt a man without even smelling any part of his person or clothes until laid on the track of his footsteps.

The second stake is of no account whatever, being that already alluded to, where the men acting as quarry had their shoe soles smeared with raw horseflesh. It was, however, thought that three competitors of the five entries would run well, so the time was taken, and Koodoo, who did badly on the "clean boot," now ran a brilliant course at a good pace, going the distance, including a check behind the wood, in five minutes. Hebe III. and Hector II. both began well, but, losing the line at about three-fourths the distance, failed to regain it, and were called up. They were awarded equal seconds, Mr. Knowles's Koodoo taking premier honors.

So much for the bloodhound trials; and now, when writing in 1892, they appear to have been entirely discontinued, at any rate so far as public exhibitions of them are concerned.

Here mention must be made of the pack of bloodhounds, kept about sixteen years ago, by the late Lord Wolverton, who hunted the "carted" deer with them in Dorsetshire and in the Blackmore Vale country. They were sold by him to Lord Carrington, who had them but a single season, during which he showed sport in Buckinghamshire. From here they went into the kennels of Count Couteux de Canteleu, in France, where they have been useful in hunting both wild deer and wild boar.

Prior to this Mr. Selby Lowndes had several couples of bloodhounds, in Whaddon Chase, where occasionally they had a run after deer. One of his hounds, named Gamester, bore a great reputation as a man-hunter, and on more than one occasion was useful in capturing thieves. This hound appears to have been a waif from some other kennel, for he was purchased from a hawk, for ten pounds, the latter using him as a protection, and to run under his van.

Then it is said, bloodhounds have been owned by the verderers in connection with the New Forest in Hampshire, but they were known as Talbots, and most of these hounds were smaller than our modern hounds. Mr. T. Nevil had a small pack at Chillend, near Winchester, dark-colored hounds—black St. Huberts they were called; a well-known writer in Bailey's Magazine, gives a long description of them, which, he says, were descendants of the pack of which William Rufus was master. It was said they would hunt anything, from "the jackal and the lordly stag, to the water-rat and such 'small deer.'" At the present time there is no pack of bloodhounds kept in this country for hunting purposes, still, with the many admirers of the race, there is little fear of the strain being allowed to become of the past.

As already hinted, our bloodhound has, in reality, suffered less from a craze to breed for certain exaggerated features, than some other dogs have done. He is still a fairly powerful and large hound, with great thickness of bone, well sprung ribs and considerable power behind. I rather fancy that, like most large-sized dogs, he fails more in his loins and hind legs than elsewhere, nor does he, as a rule, carry so much muscle as a foxhound. No doubt in head and ears he has much improved since the time he was kept for the public good at the expense of the inhabitants of the Scottish borders.

Mr. Brough, writing in the Century Magazine, about three years ago, goes at considerable length into the training of bloodhounds, which is best done by allowing the hound to hunt the "clean boot," rather than one smeared with blood or anything else. He says:

Hounds work better when entered to one particular scent and kept to that only, Mr. Brough never allows his hounds to hunt anything but the clean boot, but begins to take his pups to exercise on the roads when three or four months old, and a very short time suffices to get them under good command. You can begin scarcely too early to teach pups to hunt the clean boot. For the first few times it is best to let them run some one they know; afterward it does not matter how often the runner is changed. He should caress and make much of the pups and then let them see him start, but get out of their sight as quickly as possible and run in a straight line, say 200 yards up wind on grass-land, and then hide himself. The man who hunts

the pups should know the exact line taken, and take the pups over it, trying to encourage them to hunt until they get to their man, who should reward them with a bit of meat. This may have to be repeated several times before they really get their heads down; but when they have once begun to hunt they improve rapidly and take great delight in the quest. Everything should be made as easy as possible at first and the difficulties increased very gradually. This may be done by having the line crossed by others, by increasing the time before the pups are laid on, or by crossing roads, etc. When the pups get old enough they should be taught to jump boldly and to swim brooks where necessary. When young hounds have begun to run fairly well it will be found very useful to let the runner carry a bundle of sticks two feet or two feet six inches long, pointed at one end and with a piece of white paper in a cleft at the other end. When he makes a turn or crosses a fence he should put one of these sticks down and incline it in the direction he is going to take next. This will give the person hunting the hounds some idea of the correctness of their work, though the best hounds do not always run the nearest to the line. On a good scenting day I have seen hounds running hard fifty yards or more to leeward of the line taken. These sticks should be taken up when done with, or they may be found misleading on some other occasion. The hounds will soon learn to cast themselves or try back if they overrun the line, and should never receive any assistance so long as they continue working on their own account. It is most important that they should become self-reliant. The line should be varied as much as possible. It is not well to run hounds over exactly the same course they have been hunted on some previous occasion. If some hounds are much slower than the rest it is best to hunt them by themselves, or they may get to "score to cry," as the old writers say, instead of patiently working out the line for themselves.

It is a great advantage to get hounds accustomed to strange sights and noises. If a hound is intended to be brought to a pitch of excellence that shall enable him to be used in thoroughfares, he should be brought up in a town and see as much bustle as possible. If he is only intended to be used in open country, with occasional bits of road work, this is not necessary. Bloodhounds give tongue freely when hunting any wild animal, but many hounds run perfectly mute when hunting man. This is, however, very much a matter of breeding. Some strains run man without giving tongue at all; others are very musical.

The Story of a Dog.

MASTER FRISKY, by Clarence Hawks, "the blind poet of New England," is one of those charming nature books of modern structure which are doing good work in teaching kindness to animals, and encouraging us humans to cultivate their acquaintance by interesting us in their lovable traits; for really there is much that is interesting in the brute creation if we can only draw it out. Rudyard Kipling and Seton Thompson have taught us this, and so have numerous other writers of their class and cult.

As long ago as our childhood nurses and mothers would tell us animal stories in baby language; and back of that good Esop of old went so far as to invest those stories with instructive moral points whereby we might build up character on the ideographs presented and be convinced that animals in their wild or domesticated state are something more than mere dumb beasts to be hunted and tortured for sport, eaten for food, worked and overworked, and beaten when incapable. It is the novel sensation of kindled love in the marble heart that makes these books so attractive to old and young, and can invest with glamour the story of an intelligent collie dog.

Master Frisky is an ideal pup, through whose medium we find novelty, as well as pleasure, in extending our acquaintance into the animal kingdom. Under tutelage we can now see new beauties where all was once a barren waste. What we once saw with half an eye we now behold with a stereoscopic view; for Hawks not only describes the antics, caprices and temperaments of his canine friend and his companions, but their social games, predilections, modes of communicating with each other and making their wants known to men by voice and sign, attributing motives, designs and calculation, giving striking instances of heroism, sympathy and self-denial, not only for their own but other species, which disclose a high grade of intelligence. Crowell & Co., of this city, are the publishers of the book, and the price is 50 cents.

It is a blessed thing to have astute animal interpreters, for few of us have learned their language, and most animals are as shy of strangers as the wayside rustic who gazes at a salutation and is dumb: apparently but little above their own intellectual plane.

Indian folk-lore teaches that animals are not lower than man, but different in mental organism and caliber, as well as physical structure, speaking a different language and having different viewpoints. The souls of their deceased ancestors are inanimate in the animals they hunt, and they treat them always with profound respect, as the Siberians do their reindeer, never killing one without apologizing. The Indians wear the symbols of the bear, wolf and beaver as totems from infancy, and use them for tribal designations and for grave watchers and guardians, allotting to them a future place in the immortal life.

CHARLES HALLOCK.

Nebraska Trials.

OMAHA, Neb.—With the approach of Nebraska's second annual meet of the State Field Trial Association, the interest on all hands is intensifying. The trials will open Tuesday, August 18, and continue for three days. The entries have closed and the lists show 300 dogs, from all parts of the country, and including many of the best specimens of valuable bird dogs in the United States. Among these are J. H. McPharlin, of O'Neill, with 20 head; A. B. Caldwell, of Allidonia, Ohio, 11; Nat B. Nesbitt, Chesterville, Miss., 10; W. D. Gilchrist, Courtland, Ala., 20; Asher Cody, Holland, Mich., 20; George McLinn, Mexico, Mo., 10; W. W. Henry, Butler, Mo., 8; E.

R. Shelley, Clair, Mich., 20; W. J. Wilson, Sparta, Ill., 12; E. S. Munger, Clyde, O., 15; Charles Tucker, Staunton Depot, Tenn., 15; J. A. Gude, Bruceville, Ind., 12; Ed. Garr, Louisville, Ky., 12; W. B. Stafford, Trenton, Tenn., 15; Chas. Askins, Marion, Ill., 12; J. H. Johnson, Carlisle, Ind., 15; W. W. Updike, Robinson, Ill., 15; W. E. Utterbach, Nebraska City, 8; W. D. Hardin, Omaha, 4; W. D. Townsend, Omaha, 1; Dr. Summers, Omaha, 10; H. A. Schubillia, Tracey, Minn., 4; Wilber Fawcett, Omaha, 1. The purses will consist of a derby and all-age stake. In each there will be five cash prizes. There will be \$750 in each stake, and they will be divided 30, 25, 20, 15 and 10 per cent., and there will be no division of any of the cash prizes.

The board of governors, Dr. J. E. Summers, Jr.; Sandy Griswold, Mayor Frank E. Moores, Omaha; W. D. Hardin, Council Bluffs; P. J. McManus, O'Neill; W. H. Livingston, Sioux City; J. L. Gray, Fort Collins, Col.; J. F. O'Donnell, O'Neill; H. A. Staunton, O'Neill; Roy Johnson, Peoria, Ill.; T. J. Foley, Omaha, and R. Deb Smith, Anaconda, Mont., are now busy at work perfecting their plans to make Nebraska's second annual field trials the greatest trials on chicken ever held in the United States.

SANDY GRISWOLD.

Points and Flushes.

We acknowledge the receipt of Vol. III of the Field Dog Stud Book, published by the American Field Publishing Co., for Mrs. Dr. N. Rowe, Chicago. It contains registrations from No. 2046 to No. 3905. Besides the registrations, it contains a list of the field trials and the winners, setters, pointers, beagles and fox hounds of 1902. It is well and tastefully bound, typographically excellent and profusely illustrated.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

America's Cup Races, Aug. 20 and alternate days. JULY.

- 22. Inter-Lake Y. A., open, yacht and power races, Put-In-Bay.
- 23. Inter-Lake Y. A., squadron sail and auxiliary race, Put-In-Bay.
- 24. Inter-Lake Y. A., open, Put-In-Bay.
- 24-25. Biloxi, Southern Gulf Coast Y. A., Biloxi, Miss.
- 25. Indian Harbor, club, Greenwich.
- 25. Beverly, cruise, rendezvous Monument Beach.
- 25. Boston, club, Hull.
- 25. Seawanhaka Corinthian, club, Oyster Bay.
- 25. Royal Canadian, L. Y. R. A., skiff races, Toronto.
- 25. Hartford, Y. R. A. of L. I. Sound, special.
- 25. Marine and Field, Y. R. A. of Gravesend Bay.
- 25. Hempstead Harbor, Y. R. A. of L. I. Sound, annual.
- 25. Bridgeport Y. R. A. of L. I. Sound, annual.
- 25. Chicago, club, Lake Michigan.
- 25. Penataquit Corinthian, cruise, rendezvous Bay Shore.
- 27. Atlantic, club, Sea Gate.
- 27-29. New York, Newport series, all classes, Newport.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

- First prize, \$75.00.
- Second prize, \$50.00.
- Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

A Cruise on the Sound.

Story Submitted in "Forest and Stream" Cruising Competition.

BY GERALD CURRAN, NEW YORK CITY.

THIS summer while trying to decide by myself the best and cheapest way of enjoying my vacation, I happened to run across an old friend of mine, Tom —

We both got talking about vacations, and he suggested that if I liked the water so much, why not try a trip on

a Gloucester fishing sloop. This did not strike me at all, in fact fell far short of its mark; but in the end we compromised by deciding to cruise on the Sound for a couple of weeks or longer if we could steal the time.

The next thing to be done was to procure a boat. Now this is no easy task. We both worked like dogs, canvassing every yacht agency and scouring all of the papers for advertisements, even putting one in ourselves. By the tenth of July we had tried everything we could think of, with no tangible results. As a last hope, Tom said he would try in New Haven. If we were going at all we must start by the eighteenth, so he got busy and really succeeded in his attempt. This done, we laid in a stock of goods, wet and dry, and shipped them up to the boat, and on the eighteenth packed our grips and arrived safely in New Haven.

The boat was not much to look at, and so I told Tom, but to keep me in good spirits, he said to wait until I saw her sail before I became too deeply prejudiced.

She was moored to the dock, a sloop 30 ft. waterline, 8 ft. beam, drawing 4½ ft., a keel boat and carried a mainsail, stay sail and jib. The owner was unable to find the top-sail, so we had to leave it behind. On entering the cabin it gave a look of roominess, a bunk on either side, ice-box under the cock-pit (and an exceptionally hard one to get at) small oil stove forward, and cooking utensils stacked around on nails. The boat originally carried a centerboard, but for some untold reason the owner took the board out and put a keel on her. He must have been born and bred in the Great Sahara, anyway he was no authority on boat building. The keel was at least two feet too short and consequently on every tack we lost about one-quarter of the distance. She was not much on pointing, as we afterwards found out. The boat leaked considerably and the bilge water kept coming through the cabin floor whenever she heeled at all.

That night when everything was aboard, we both decided that it was easily the best stunt to get down to Morris Cove, then get a good early start the next morning. The night was warm and sultry, with only a faint breath now and then. We hoisted the mainsail and jib, but did not move. I then got into the dinghy and Tom cast me a line to the great derision of a number of small boys on the bank. At last we got her towed out beyond the pier and caught a faint breeze. Five miles to southward we saw the lights of the New Haven breakwater, and keeping in the channel, made out with wind and tide. We anchored off Morris Cove about 12. Everything was in order by this time and we got into bed, or rather wrapped ourselves up in blankets, in very short order, not, however, forgetting our mid-night swim.

It was the first time I had been in salt water for nearly a year, and it immediately brought me back to the time I used to spend all my summers that way; making me envious of all who did not have to slave; and at last dropped into a light slumber. Sleep was not for us that night, however. Every steamcraft or auxiliary going by would wake us up with a start, and when the Richard Peck went out-bound for New York, our language was not fit to print. By dint of much will power, however, we managed to "tear off a few yards." At 4:45 the next morning we were both up and making preparations to get away. Tom was for cooking breakfast first, but this time I had my way, so we got up sail and started while Tom cooked breakfast.

The Sound looked very ugly indeed, dark with lots of white-caps and a strong east wind blowing, bringing with it enough rain and fog to make a record wheat crop in the whole United States.

Breakfast consisted of poached eggs, fried sausages and coffee. It was fine for Tom, who ate in the cabin, but am afraid I did not enjoy it as much being outside sailing. Rain was pattering down on the eggs and sausages in a continuous stream, and it was pretty tough work to get everything inside of me before it was drenched. Still nothing daunted we kept along. Stood out on port tack for about three miles; wind began to freshen here however, so we decided to tie in a reef and make for Branford Point, which stood about six miles away. I brought her up into the wind and Tom started to get the sail down, but here our troubles began. The peak halyard caught between the jaws of the gaff and the mast, and try as we might we could not budge it. Here indeed was a dilemma for two amateurs. To add to our discomfort the sausages were beginning to show their indigestible facilities. The boat was now bobbing up and down and all around, there being quite a sea on. I bravely volunteered to climb the mast and loosen up the halyard, but here the sausages got to work again with renewed vigor, so slipped down again. Tom then tried it and, happy to say, succeeded. We tied the reef in and Tom put one in the jib also and we were off again. One reef point in the jib was left untied and the first puff of wind that struck us tore a big rent in it. This was discouraging, but nevertheless took in the jib and got the staysail up and kept at it.

Just about this time I very inconsiderately fell asleep in the cabin. Tom took charge, and when I woke up two hours later, found us one mile from shore and two miles east of Branford Point. We went close to shore now, dropped anchor and had some lunch. After our repast of canned beef, beer and crackers, patched up the jib with some duck trousers and started off again, it being about 2.30 P. M. to try for Sachem's Head, eight miles to eastward. We failed in the attempt and put into the Thimble, two miles this side. We anchored here in a very good harbor just off Money Island. This is so called because it is supposed to have been one of the hiding places Captain Kidd used to store his ill-gotten gains. We were both tuckered out at this, our first day's experience, and lay down and slept like logs until 6.30 P. M. We were awakened by a man bumping into us in a small boat. We stuck our heads out of the cabin and found three natives in boats. At our appearance they immediately set up an awful din. We found out at last that they were regular runners in for the three hotels on the Island. Each one offered us a dinner for less than the other till it really seemed as if we would get one for nothing if we waited much longer. We found out afterward that there was much rivalry, and that each hotel keeper tried to draw the trade of the other by this means. We at last decided to try a shore dinner at the Money Island Hotel at 50 cents a head; this closed the bargain, and

getting dressed, went ashore and found a really very good meal awaiting us. We were not nearly rested yet so went back to the boat to straighten things out, and by 9.30 were asleep once more. The next morning (Sunday) we found the weather much the same as the day before, strong east wind, big sea running with every chance of its coming on thick before long, so we decided to rest ourselves till afternoon anyway. Had breakfast and loafed around the boat reading a morning paper a boatman threw us as he passed. We were very well satisfied now and began to look forward to some good weather on the morrow. Had some lunch about one o'clock, and in the afternoon the weather still being bad, went over to Pine Orchard, a two-mile row, getting back to Money Island about six for dinner. We found this a very picturesque place, not over an acre of ground, just filled with small cottages. It can be reached from the east or the southeast, and is a very good place to lie, except for a southerly blow. On Monday morning we got up, had a breakfast of eggs, bacon and coffee, and on looking at the weather made up our minds to get out or bust. The wind was a light one from the east and no sea, so immediately after breakfast we got up sail. (We washed our dishes just before our meals instead of just after). Were trying for Saybrook breakwater to-day, at the mouth of the Connecticut River, and further if possible. It was a beat all the way. The New Haven Yacht Club and the Sachem's Head Yacht Club were starting on a cruise together, and the way they all showed us their name plates was not only thoughtful of them, but was also very discouraging to us, for we now realized what a slow old tub we had. We plunged on however, and about noon were off Falkner's Island. At three we picked up little Duck Island and went inside the breakwater. This we found a very good harbor for all craft, about half way between New Haven and New London. Cornfield Point was passed about 4.30, and we saw if the wind held we would make Saybrook. It held all right, but when about two miles west of there a dense fog blew in and we could not see 100 feet away. This was a fine pickle for us to be in as we had no chart, our compass was out of order, and our boat an awfully poor one in a blow. We kept on just the same, being guided by the lighthouse fog signals, which were audible to us here. About a mile from the breakwater a small sloop loomed up just ahead. We luffed up and she just got by us. They were coming from the eastward making for Saybrook and had missed it completely. We told them to follow us, and also got them to look up the harbor entrance on their chart. This they did, and about 7.30 rounded the breakwater and stood in. We kindly allowed them to go first, which turned out to be very lucky as they stood in too close to the breakwater and went hard aground. We luffed up just in time and waited to see if we could be of any assistance, but there was nothing to be done, so started on. Just at this point the wind dropped completely, and here Tom showed his cleverness. He called for me to get the sail down and dropped anchor P. D. Q. This I managed to do as quickly as possible, and none too soon, for just as the peak struck the boom a squall struck us. It was a dandy and blew so hard we started for the other anchor. By the time we got it over, it was raining pitchforks and blowing hard enough to almost take us off the boat. Got into the cabin and started to cook dinner, considering ourselves extremely lucky to have gotten into port the time we did, as it would have been more than disagreeable to have been caught outside in such weather. The dinner, with the help of a few glasses of that Kentucky beverage, set us on our feet again, and we dropped off to sleep, with nothing but the swash of the water against the boat and the rain pattering on the cabin roof to disturb our well-earned slumbers.

Tuesday was a raw day indeed, with lots of fog and no wind, also found we were aground. Everything was in disorder and we were pretty well disgusted, so got dressed and rowed over to the Hartford Yacht Club for breakfast. We made a good meal here and walked up to Fenwick Hall, a summer hotel and lounged around there all the morning, and about one o'clock we sauntered down to the boat to put things in order. The weather now seemed more propitious, the fog having lifted, and a fair wind coming from the east, so decided to strike across the Sound for Plum Gut. I forgot to mention that the boat had drifted off with the tide. We calculated on one long leg to the Gut and a broad reach to Shelter Island, but when we reached the middle of the Sound the wind veered around to southeast, so it was a dead beat again. We struck Plum Gut at six o'clock. The tide we had depended upon to take us through had turned, and to add to our discomfort the wind was dropping and a squall was making up in the northwest and was coming right towards us. There was absolutely no place to go however, so stuck to it and at last got around to the south shore of Plum Island. Did not dare to risk trying for Shelter Island, as we would surely have been carried out in the Sound again by the tide. We anchored here, the boat bobbing around like a cork. The squall blew off to the northeast, but as it was so late we did not start out again. Cooked up a fine dinner of soup, steak, corn and coffee and went to sleep to the accompaniment of a fife and drum corps on Plum Island. Any noise was welcome here as it was decidedly lonesome. Next morning we reached Shelter Island without much excitement. Anchored off the Shelter Island Yacht Club about noon and went ashore for lunch. We fooled around here all day stocking up, also took a journey to Greenpoint and tried to have our compass repaired, but finding this impossible, purchased a small dory compass. Thursday we started for Sag Harbor, making our course around to westward of the Island. This we found a very pleasant sail indeed. Just a good sailing breeze from the southeast and made it nicely. Sag Harbor we found nearly as slow as the play of that name that I saw in New York two winters before. A quiet old town, the activity being the mills. A peculiar custom was in vogue there at the time, one that we considered decidedly unique. At the previous election the Prohibitionists had won, so there was supposed to be no traffic in liquor. Tom and I needed an appetizer for dinner, so asked the man behind the lemonade (?) counter for two Martinis. He looked fiercely at us for a minute and said that no intoxicating liquors were sold there, but if we wanted a good rasp-

berry vinegar he was just the man to give it to us. We were in doubt at first, but on being reassured that if we did not like it, we would not have to pay for it, we told him to go ahead. We drank them down, and lo and behold, we had a perfect Martini. This is the way they got around the law, and as the sheriff was a friend of all traffickers in lemonade (?), they seemed practically immune from molestation. After dinner we drove to Sagaponack, four miles away, on the south side of Long Island. Tom had friends there, and by the time they showed us, I concluded were very staunch friends indeed. We were wine and feted for three hours at least, and arrived back at the boat in a very fair frame of mind. Sag was a fine old place and will always hold a tender spot in my memory. If those frank good-hearted Westerners we met there treat everybody as they treated us, there would never have been any necessity for the translocation of the Golden Rule.

Next morning we pulled out of Sag; am afraid neither of us wanted to go, but we made no confessions, and said no things except about our chances for the day's run. The wind was still east. Really I am getting tired of that phrase, but my weariness is nothing compared with the language each morning on making a forecast. It had never varied at all with the exception of Tuesday, and that was the only day so far that we had wanted it still east. We had no special port in mind at the start, but purposed to beat along the shore and get as far as possible. Fort Pond Bay was the nearest place to Montauk that we could anchor with any safety, and we had no hopes of Block Island unless the wind changed. Spent most of the day beating and about 5.30 reached a place called Napeague Bay. We had had enough sailing, so decided to put in here rather than try for Fort Pond Bay, eight miles further east. The Coast Pilot said this was good enough when once in, but had a very difficult channel and was unfit for strangers. Nevertheless we made up our minds to try it, so put in, and as might have been expected went hard and fast aground. The air at once grew thick with many varied and highly original oaths. We both stripped and tried to push her off, but there was nothing doing. Tom got into the dinghy and rowed around for twenty minutes, and at last said he had found the channel, and that we would put in when the tide took us off. It was now about six o'clock, and we had to wait for two or three hours before we would float, so sat around for a while and then cooked a rattling good dinner. Soup, steak, corn, stewed tomatoes, beer and coffee. After this we were in much better humor. Got things ship-shape. (I really never saw such a sloppy boat as ours was). Never anything where we could find it, and clothes, towels and cooking utensils lying around everywhere. The wind was freshening up a bit, so got up sail. I took the wheel, hauled the sheet in close and Tom tried to haul her off. Nothing doing. I got tired holding the sheet just about this time, however, and let her go. Just at this time a puff of wind struck us, and I grabbed the sheet just in time. She gave a mighty tug and we were off. This was sooner than we had expected. Tom said the channel was just ahead (we were heading west now), so I kept at the wheel, waiting for Tom to give the word to steer in. I got it in a minute and put the wheel to starboard, but just then we struck again. I immediately eased the sheet out and we slid off. In the dark must have missed the channel entirely. Well, it looked as if we were in for a night of it. Had to go by compass and chart entirely, as it was very black and no lights around there to guide us. Montauk was not visible from there, land intervening. We made out a fixed white light to northward, but did not know whether it was Little Gull Island or Watch Hill Point. We laid our course N.E. $\frac{1}{2}$ E. Tom got up forward to look out for any signs of land while I took the wheel. Now, I had never sailed by a compass before, and it was decidedly confusing. Tom kept yelling, "Keep her up, keep her off," until I did not know what I was doing. He soon came back and found we were sailing northwest instead of northeast. Here we again expressed ourselves freely. He then showed me how to keep the needle pointed N.E. $\frac{1}{2}$ E., and which way to turn the wheel when she went off. We began to get along now. Stood on the starboard tack for about four miles, then took a tack in toward shore. We went about again and at 1.30 A. M. saw a light about two miles to southeast of us. We did not know what it was, but decided to trust to luck as we figured we must be off Fort Pond Bay by this time. It was a beat in, Tom took the wheel and became the lookout. We kept at it and anchored near the light, which we found out to be a menhaden fisherman's boat at anchor. There were about ten other craft anchored all around, but this was the only one that had a light out. It saved our lives that night, and we eternally blessed that chap for his thoughtfulness. We were due for an all-night game but for this little incident, although it was then 2 A. M. We got to sleep very soon without much trouble, not forgetting, however, to hang out *our* anchor light. Next morning, Saturday, we made up our minds to try for Block Island, about eighteen miles to eastward. The sun was out all day to-day. I mention this as it was a very agreeable surprise indeed. The wind still held from the east, blowing about four knots. Had a fine breakfast of bacon, eggs and coffee, then got up sail. It was a beat all the way. This, as you see, was the rule. Got started at 8 A. M. with the wind growing lighter every minute. Stood well out toward Watch Hill Point, and on nearing Fisher's Island, stood about to avoid the tide as much as possible. On this tack we just cleared Montauk. We then went about and thought to relieve the tedium by a little fishing. Got out a heavy line and shiner and heaved it astern to troll for bluefish. We kept on going all the morning this way, but no fish rose to our bait. Saw many black duck and could have gotten some if we had had a gun. About twelve o'clock we began to get hungry, and were beginning to talk to ourselves and also the bluefish for not getting the buoy. Just then we heard the familiar thug of an auxiliary. We saw it was a fisherman, so we went about and stood over near him. He had been more successful than we, so hailed him thusly: "Will you sell us a quarter's worth of fish?" "Yes." "What will you give us?" At this he said nothing, but held up an enormous fish of some kind, big enough to have kept us in grub for three days. "Too big, too big,"

we cried. We were very close then, so told him to throw us a couple of porgies. He threw them in the boat as we passed, and I threw him a quarter wrapped in a piece of newspaper. He seemed doubtful about getting the money at first, but succeeded in reassuring him. They were fine big ones still alive. Tom cleaned them and in twenty minutes each had a fine fried porgy. We stood on for Block Island, hoping to get there in time for dinner. Said porgy did not agree with Tom, and about 2.30 he worked up a dandy grouch. I felt somewhat that way myself, went below for a sleep. Woke up 5.30. Dead calm. We could make out Watch Hill off to northwest. Fisher's Island also and Block Island to southeast, but could not move a foot. Then and there we both cursed our luck, the boat, weather and ourselves. We saw Block Island was out of the question that day, and we knew we could never get to Newport. As Watch Hill seemed nearer than any other place, decided to put in there. We cooked a can of tomatoes, got out the black bottle and tried to feel better, if this were possible. Tom was tired, so went down and tried to sleep, but there was quite a ground swell on, and this kept the gaff creaking so that sleep was impossible. There we stayed until 11.30 watching the Sound steamers go by all lighted up like floating palaces. Just about then, however, a little breeze sprung up from the northwest. I eased out the sheet and stood in a northerly direction to the Rhode Island shore. The tide was against us and were afraid of being carried through the Race. This only lasted for a short time, however, and then another calm. About 1.30 A. M. got a faint breeze from the northeast, put about and headed for Watch Hill light, five miles to westward. This wind kept blowing up stronger, and we went along finely, sighting the Stonington breakwater lights at about three, one flashing red and one fixed red on the end of each breakwater. Without much more excitement we anchored just inside at 4 A. M. We were both done up and felt pretty sore, but succeeded in getting a fine dinner, or should I call it a breakfast, of soup, steak, potatoes, corn and coffee. We then dropped asleep. The next day being Sunday, slept late and started in about 1.30 P. M. to make Watch Hill Harbor. I had been in a number of times before and knew the channel. Tom took the chart and tried to bluff me into thinking he was the navigator. We passed the folly successfully, and on nearing the Westerly River, had a difference of opinion as to our course. Tom told me to keep up to the eastward, while I wanted to sail northeast in the channel. We split the difference. A friend of mine once took out a sailing party, and was getting on finely, when some one asked him if he knew the harbor was full of rocks. The chap said, "Yes, I know every rock in this harbor." Just then, bang! they struck one. He then laconically remarked, "And this is one of them." That was our case exactly. We struck a big one, and the boat seemed to jump right out of the water, hesitate, and then luck was with us this time, we slid over. No damage done, and Tom threw the hook overboard in about fifteen feet of water, just off the Plimpton Rock. We spent three days here, not leaving until Wednesday A. M. There were many genial souls around, and they made us feel perfectly at home. We succeeded in forgetting our troubles, and between our friends and black bottles, managed to pass our time most enjoyably. As I look back on it, have come to the conclusion that it was just as well for us that we decided to start then. If we had waited much longer, would not have gotten away at all, as I afterward learned that an officer of the law came down to the Plimpton Dock twenty minutes after we had started with a warrant for our arrest. Nothing doing, the birds had flown. Got away safely, this being the turning point of the noble Cypress. We headed her back to New Haven. With a fine northeast wind behind us, we passed Stonington breakwater at a good clip, and kept well out to Latimer's Reef. This we left to port and left Ram Island Light vessel to starboard. Reached New London between 2 and 3 P. M. The rest of the afternoon was spent in fixing up ship and rowing around the harbor looking at the yachts. The Philadelphia Yacht Club had just arrived and the harbor presented a fine appearance. Went ashore about six o'clock and had a fine meal at the Crocker House. Watch Hill had pretty well tired us out, so went down and got asleep in short order. Thursday morning we determined to try for New Haven. A good wind of about six knots was blowing from the northeast, the tide being against us. Had breakfast and started out leaving the beacon to port, making our course near Sarah's ledge, and inside of the Bartlett Reef light vessel. The wind was dying out now, and as the tide was taking us back, dropped the hook overboard off Two Tree Island, and luckily it caught. Stayed here for about an hour and with a little more wind started on. Passed Saybrook at a good pace, the tide now being with us. Such a contrast to the last time we had been there that we could not help but remark on it. Falkner's Island hove in sight and about now we had lunch. Toward the end of the afternoon the wind dropped almost entirely and we just succeeded in drifting into Sachem's Head Harbor, before the tide turned. This harbor is very small, but affords good protection, except from a south-west blow. To get in, keep one-half mile below Sachem's Head, then steer for Joshua Point until the harbor opens up. The sailing direction for entering is E.N.E. $\frac{1}{2}$ E. Dropped anchor and prepared dinner. Had a steak that we had purchased at Watch Hill. No ice all day though, and when I tasted the first mouthful my face must have been a study in curves and angles. Tom thought it was fine though and ate it all. That night we had to put a pail and a cushion over it (Tom would not hear of throwing overboard what was left), not only to prevent the smell, but to keep it from crawling away. The mosquitoes here were awful, as one facetious youth in a boat nearby remarked: "This is sometimes called Scratchem's Head."

Next morning went ashore and got some milk and eggs, having breakfast of those ingredients. Got the sail up and started for New Haven with a very light wind behind us. Tide was against us and we made very slow work of it. Passed inside of Branford Beacon and Nigger Head buoy. At 4.30 reached New Haven after an uneventful day and a very eventful trip.

Now, this may seem like a long, hard luck story to the reader, but have only tried to give the facts just as they

happened, and how they appeared to us. From this evidence it seems impossible for anyone not to enjoy a cruise, for under these most trying circumstances, can safely say that I don't know of a more genial and healthful twelve days spent on the water. Of course we had poor weather, but (maybe I am *too* enthusiastic), under the worst of circumstances I can't imagine a more delightful way of spending one's vacation, and sincerely hope that this story may be the means of some one attempting the best and only way of bringing health and happiness to himself and his friends.

The Canada's Cup Defender.

TORONTO, July 18.—The contest for the great international trophy on fresh water is just three weeks away, but everybody is guessing just as much as they were when the challenge was given.

The Rochester boat has given some very encouraging performances against the cutter *Cinderella*, but she is as yet an unknown quantity to Canadians. The Toronto boat has given some very encouraging performances against the cutter *Merrythought*, but she is as yet an unknown quantity to Americans. Both *Cinderella* and *Merrythought* are well known flyers on Lake Ontario, but it is doubtful if they have ever come together in a race, although they have often been in the same port. *Cinderella* is the larger, and, I believe, the older boat, but the two are considered fairly well matched. Some years ago, when a race between the Toronto schooner *Clorita* and *Cinderella* was proposed, Canadians did not jump at the offer, but they would have been willing to send *Merrythought* as a substitute for the schooner. The proposed race was to be for the Fisher cup. It didn't come off.

The Canadians, however, go into the present *Strathcona-Irondequoit* contest with no misgivings about not having the best available defender. In 1901 there was doubt as to whether *Beaver* or *Invader* should be sent after the cup, and in 1899 there was doubt as to whether *Beaver* or *Minota* should defend it. This year there is no hesitation about using the defender *Strathcona*. Of course, she is the only boat that will fit the class; but, apart from that, she is showing herself the fastest cutter in the Royal Canadian Y. C. fleet.

Strathcona sailed a splendid race on Saturday, July 11. It was the first club contest she had entered, and she came out with flying colors.

Every year the larger craft of the Royal Canadian Y. C. fleet race for what is known as the Lorne cup, a handsome trophy presented for perpetual competition by the Marquis of Lorne. The race on Saturday was across Lake Ontario to Olcott, N. Y., a distance of 39 miles. The course is southeast half east from Toronto. There was a light breeze, a smooth sea, plenty of sunshine, and a good fleet of contestants, the entries being *Strathcona*, *Merrythought*, *Canada*, *Yama*, and *Dinah*. *Strathcona* was handled by Mr. G. E. Macrae, brother of the owner, Mr. Norman Macrae. Commodore Jarvis sailed *Merrythought*. She was the scratch boat, being the biggest in the fleet.

The wind was light and variable, from the west and south, and the yachts had many varieties of sailing with started sheets, sometimes even getting spinnakers to draw. *Merrythought* got a lead before they had cleared Toronto Bay, and *Strathcona* found the stern chase the usual long one. When the wind would freshen she would pull up, and when it dropped *Merrythought*, with 700 feet more of canvas, slipped ahead. Her greatest lead was about three-quarters of a mile.

Merrythought and *Strathcona* were sailed to windward of their course, so as to get the benefit of the land breeze off the south shore, but the other boats, by cutting off the corner, made nearly as good time. *Merrythought* was first in, with *Strathcona* two minutes and a half astern, and well within her time allowance. The others were well strung out, *Canada* coming in third, *Yama* fourth, and *Dinah* last. Corrected time gives *Strathcona* first place by 6m. 27s. over *Merrythought*, with *Canada* in second place and *Merrythought* third.

In the return to Toronto on the following Sunday, *Strathcona* did even better. Closehailed on a west and southwesterly wind she and *Merrythought* led the fleet, but the windward work was exactly to *Strathcona's* liking, and there was no holding her. She was at her moorings in Toronto fully half an hour before *Merrythought*. This big gain was in part due to the fact that *Merrythought* sailed around Toronto Island and came in the Western Gap, while *Strathcona* took the shorter passage, via the eastern piers. But Mr. Jarvis says that even had they covered exactly the same ground *Strathcona* would have beaten *Merrythought* by from twelve to fifteen minutes. It is, therefore, safe to say that in a whole sail breeze and moderate sea *Strathcona* is twenty seconds faster than *Merrythought* in the mile, exclusive of her time allowance.

Commodore Jarvis took charge of *Strathcona* this week, and the first official trial was sailed on the afternoon of Tuesday, July 14. Mr. J. Wilton Morse was placed in charge of *Merrythought*. He is a skilled amateur skipper and designer, and sailed Toronto, a Duggan designed centerboarder, in the trial races for the selection of a Canada's cup defender in 1899. Mr. Jarvis took charge of *Strathcona* with a good crew. They may not all sail in the actual cup contest, but they were all good men and are ready for the job. The official trial was sailed around Toronto Island, from the town club of the R. C. Y. C., in a fitful but fairly strong north-breeze. The two contestants went over the line together, but the advantage was with *Merrythought*. Skipper Jarvis came down about a second too soon, and had to luff *Strathcona* to keep her from going over the line ahead of time. Consequently, although he crossed practically on gun-fire, he was at a disadvantage compared with Skipper Morse, who brought *Merrythought* over the lee end of the line under full way. The difference was at once apparent, for *Merrythought* was a couple of lengths ahead before the yachts were a hundred yards from the starting point, and although she was to leeward she was far enough away to escape a blanket. *Strathcona* carried an enormous jib topsail, reaching from truck to bowsprit end, and cut comparatively low in the clew. *Merrythought's* topsail was much smaller, her owner never having been partial to big kites of this variety. In other respects the boats

were canvassed equally, No. 2 club topsails being carried aloft on account of the puffs.

Notwithstanding her extra head canvas, *Strathcona* could not gain anything on *Merrythought* in the run to the eastern gap. With the wind over the quarter the older boat's greater total sail area was sure to count. Going out the eastern piers *Merrythought* had a lead of fifty-five seconds.

The yachts had the wind abeam in the long stretch up the south shore of the island, and *Strathcona* did somewhat better, cutting down her opponent's lead by fifteen seconds in two miles. Once they turned the can buoy at the southwest point of the island, however, the new boat shot ahead. The thresh into the western gap was decidedly to her liking. She rapidly worked ahead of *Merrythought* and had a lead of a minute by the time they had gone a mile.

Once the piers were entered and the yachts were heading back for the finish buoy with started sheets, it was expected that *Merrythought* would retrieve some of her loss, but *Strathcona* appeared to benefit by all the puffs, and came tearing over the line with a lead of a minute and a half. The official time was:

	Start.	Finish.	Elapsed.
<i>Strathcona</i>	4 10 00	5 13 45	1 03 45
<i>Merrythought</i>	4 10 00	5 15 15	1 05 15

The course is about seven miles around. Adding two minutes' time allowance (unofficial); *Strathcona* won by 3m. 30s.

Commodore Jarvis has his crew out every day drilling, and as they are all good sailors they will know their work thoroughly by the time of the races.

CHARLES H. SNIDER.

Winthrop Y. C.

WINTHROP, MASS.,

Saturday, July 18.

The Y. R. A. open race of the Winthrop Y. C. was sailed off Winthrop on Saturday, July 18, in a whole sail southerly breeze. In the 25ft. class were the old champion *Calypso* and the new Burgess designed *Early Dawn III*. Both yachts went over the starting line together, with *Early Dawn III* in the weather berth. *Calypso*, however, soon pulled out ahead on the windward leg and kept her lead to the finish. *Early Dawn III* made some gains on the reaches, but she was in no condition to race, having been rigged only the day before, and was also leaking. She withdrew on the first leg of the second round. In the 22-footers, *Medric* had the best of the start, and was leading in a hot contest on the windward leg, when her bobstay parted and she withdrew, leaving *Opitsah V.* to finish it out alone. In the 18-footers the boats went over the starting line in a bunch, *Miss Modesty* to leeward, going over in the lead. *Domino* worked out into the lead on the windward leg and was never headed. In the first handicap class *Eclipse* led the class over the finish line and drew a dead heat with *Noturus* on corrected time. In the second handicap *Zetes II.* led by a big margin in, but lost to *Louise* on corrected time. The summary:

Class D—25ft. Cabin Yachts.

Cohasset Y. C.

COHASSET, MASS.,

Saturday, July 18.

The first of the second series of races of the Cohasset Y. C. was sailed in a stiff southwest wind. The race in the 21ft. class was close, *Remora* winning by less than a minute. Result won easily in the 18ft. knockabouts. In the special class were two of Mr. C. W. Barron's knockabouts, *Fly* beating *Fancy*. *Selma* finished first in the handicap class, but lost on allowance. The summary:

21ft. Knockabouts.			
	Elapsed.	Corrected.	
<i>Remora</i> , Courtney Crocker.....	1 32 56	
<i>Harelda</i> , Alanson Bigelow, Jr.....	1 33 35

Beverly Y. C.

BUZZARD'S BAY, MASS.

Saturday, July 18.

A race of the Beverly Y. C. was sailed in Buzzard's Bay on Saturday, July 18, in a whole sail southwest breeze. The 30-footers were well bunched on the beat to windward, but on the run home *Pontiac* and *Mashnee* opened out. These two sailed a hot race, *Pontiac* winning by 21s. The closest race of the season was sailed in the 21ft. class, *Radiant* and *Edith* sailing a dead heat. *Allison II.* won in the fourth class. *Fiddler* won in the 15-footers, and *Darlinger* in the special class. The summary:

30-footers.		Elapsed.
<i>Pontiac</i> , Philip Beebe.....	1 58 50
<i>Mashnee</i> , R. W. Emmons, 2d.....	1 59 11
<i>Young Miss</i> , D. L. Whittemore.....	2 00 09

Quincy Y. C.

QUINCY, MASS.,

Saturday, July 18.

A club race of the Quincy Y. C. was sailed at Quincy on Saturday, July 18, in a light southwest breeze. In the first class *Marvel* took the start and led the class all over the course. In the second class *Gaycap* won handily, but the feature of this race was the work of *Clover*. Just before the start she carried away her headstay. This was patched up, but soon after the start her mast cracked. She continued the race and finished second. In the special class *Omeme* won easily, and in the one-design class *Betty B.* finished alone. The summary:

First Class.			Elapsed.	Corrected.
<i>Marvel</i> , A. A. Lincoln.....	2 01 37	1 20 57
<i>Hustler</i> , Whittemore & Robbins.....	2 06 29	1 24 43
<i>Nesona</i> , A. L. Lincoln.....	2 03 05	1 24 55

Corinthian Y. C.

MARBLEHEAD, MASS.,

Saturday, July 18.

The third championship race of the Corinthian Y. C. was sailed off Marblehead on Saturday, July 18, in a light to strong southwest breeze. In the second class *Chewink III* got the start and led all over the course. In the handicap class *Dabster* won easily. *Arrow* got the start in the 18ft. knockabouts and was never headed. The summary:

Second Class.			Elapsed.	Corrected.
<i>Chewink III</i> , F. G. Macomber, Jr.....	2 08 58
<i>Great Haste</i> , T. K. Lothrop, Jr.....	2 11 50
Class B—Handicap.			Elapsed.	Corrected.

The judges were W. W. Keith, G. H. Mayo and H. S. Goodwin.

Columbia Y. C.

SOUTH BOSTON, MASS.,

Saturday, July 18.

The third race of the Columbia Y. C. was sailed in Dorchester Bay on Saturday, July 18, in a stiff southerly breeze. In the first class *Wapiti* won easily on both elapsed and corrected times. In the second class *Acme* finished first, but lost to *Guide* on allowance. In the third class *Osceola* won easily. The summary:

First Class.			Elapsed.	Corrected.
<i>Wapiti</i> , E. J. Powers.....	1 48 21	1 36 21
<i>Nelka</i> , George Coye.....	1 52 38	1 42 38

New York Y. C. Cruise.

RENDEZVOUS, GLEN COVE, L. I.

Thursday, July 16.

One had only to run into Glen Cove on the afternoon of Thursday, July 16, to see that the prosperity of the country and the interest taken in the coming races for America's Cup have made this a banner yachting year. The fleet of steam and sailing craft at anchor there in preparation for the first day's run of the fifty-eighth annual cruise of the New York Y. C. on the morrow, was the best in both branches that the world can produce. English and American designers were represented by their most successful creations.

The 90-footers—Reliance, Constitution and Columbia—were the object of admiration, even from those who had seen them over and over again in the trials thus far held to select a defender. They looked as fit as hard work and wealth could make them, and promised unexcelled sport during the days to follow.

At four o'clock in the afternoon Commodore Frederick G. Bourne's flagship Delaware steamed into the harbor. A salute from the big imported steamer was answered from the throats of a hundred cannon on board the different boats riding at anchor.

Signals were soon run up on the Delaware by order of Fleet Captain Robinson calling a meeting of the captains on board the flagship. Gigs and launches were soon pointed toward the commodore's ship, and in a short time the meeting was in session.

It was the third general meeting of the club. Among other business transacted was the election of members, which included the following:

John Murray Watts, John W. Keogh, Rufus L. Patterson, Robert C. McKinney, William M. Crombie, Charles R. Crane, Ensign J. W. Timmons, U. S. N.; Ensign F. O. Branch, U. S. N.; Gerald Holsman, W. H. McCarter, Robert E. Robinson, John Hewitt Booth, L. C. Hanna, Lieutenant W. M. Falconer, U. S. N.; Horace E. Hooper, Frederick W. Clarke and Andrew W. Rose.

The meeting was later adjourned until Aug. 17.

The next business in order was the discussion of the plans for the cruise. It was decided that the harbor start should be signaled at 8:30 o'clock the next morning from the flagship, and that the regatta committee should send the boats away from the start off Matinecock Point an hour later.

A number of the squadron had not been measured under the new rule of the club. It was decided to allow them to compete in the different runs subject to measurement before prizes would be awarded. An innovation on the flagship was a bugler who was to blow all calls at the different ceremonies of the day in the manner of a man of war.

The steam yacht Riviera was to act as judges' boat, the regatta committee being the guests of Col. R. M. Thompson. Among the yachts seen in the harbor were the following:

Steam Yachts.—Delaware, Commodore F. G. Bourne; Corsair, J. Pierpont Morgan; Niagara, Howard Gould; Narada, Vice-Commodore Henry Walters; Roamer, N. G. Herreshoff; Noma, William B. Leeds; Riviera, Colonel R. M. Thompson; Rambler, L. Cass Ledyard; Katrina, L. F. Heublein; Lagonda, Edward Browning; Corinthia, J. A. Mollenhauer; Carmen, C. A. Starbuck; Sagamore, W. H. Barnard; Florence, A. H. Alker; Nirvana, W. R. Sands; Artemis, F. G. Bourne; Coranto, Arthur E. Austin; Parthenia, Morton F. Plant; Cayuga, Thomas W. Slocum; Embra, John T. Williams; Surf, C. K. G. Billings; Duquesne, James G. Butler; Zoradya, Miss Atala W. Thayer; Scout, August Belmont; Admiral, George R. Sheldon; Kismet, F. S. Smithers; Margaret, Isaac E. Emerson; Elsa, Miss Eloise L. Breese; Tuscarora, Walter Jennings; Aria, Edward H. Blake; Varuna, George F. Dominick; Duchess, Leonard J. Busby; Virginia, Isaac Stern; White Heather, Edmund Randolph; Sultana, Arnold Thayer; Belemere, Samuel T. Shaw; Trionyx, Charles McLaughlin; Saghaya, Howard C. Smith; Layrock, W. J. Matheson; Adrienne, Adrian Iselin; Inia, H. S. F. Davis; Privateer, R. A. C. Smith; Surf, Adrian Iselin, Jr.; Neckan, Henry W. Bates; Viva, Edward Eyre; Reba, Nathaniel Witherell; Aileen, Edwin Gould; Oneida, E. C. Benedict.

Schooners.—Southern Cross, Edward F. Cole; Kiwassa, Henry A. Rusch; Chanticleer, George W. Weld; Hildegard, Edw. R. Coleman; Elmina, F. F. Brewster; Valmere, John M. Richmond; Quissetta, Samuel C. Davis; Ingomar, Morton F. Plant; Latona, Henry C. Eno; Columbia, W. Gould Brokaw; Emerald, William E. Iselin; Corona, Arthur F. Luke; Clytie, Henry C. Ward; Esperanza, F. F. Olney; Viking, James B. Smith; Idler, Henry T. Sloane.

Sloops.—Reliance, C. Oliver Iselin, et al.; Constitution, August Belmont, et al.; Columbia, E. D. Morgan, et al.; Vigilant (yaw), F. Lothrop Ames; Senta, Thomas M. McKee; Spalpeen, Robert M. Riddle; Mimosa II, Trenor L. Park; Xara, George W. Scott; Isolde, F. M. Hoyt; Queen Mab, Lucius H. Smith; Eelin, F. L. Rodewald; Khama, Seymour J. Hyde; Aspirant, Hanan Bros.

Friday, July 17.

SQUADRON RUN.

Glen Cove to Morris Cove—37 Miles.

The first day's run from Glen Cove to Morris Cove, at the entrance of New Haven Harbor, was one to test the patience of a saint, and as a means of deciding the relative merits of any two boats was of absolutely no worth. The breeze on Long Island Sound was shifting from one point to the other, coming off shore in favorable puffs and then falling flat altogether. Yawing around on the glassy surface of the water in the broiling sun was not a condition to make the skipper in the doldrums at all good natured.

In these conditions Reliance suffered her first defeat, victory going to Constitution on time allowance. The latest Herreshoff creation finished off South Ledge 59 seconds ahead of Constitution and 7m.21s. ahead of Columbia. The time allowance that Reliance concedes the Belmont boat has not been made public. It is approximately 2 minutes, however, a sufficiently large one to give the ill-fated creation of 1901 her first victory over Reliance.

Commodore Bourne signaled the harbor start at 8:30

o'clock. At this time there was hardly a breath of air stirring. The boats were a long time getting out to the line off Matinecock Point, where the race committee boat had anchored. The preparatory signal for the first of the fleet to get away was not sounded until 10:45, although the start was scheduled for 9:30.

The sloops and schooners started first and then the 90-footers. The first signal was sounded at 11:15. The warning came ten minutes later. The starting gun was at 11:30. All of the boats took more than the two minutes' handicap time, and crossed separated by seconds only. The wind was S. S. W. at about 4 knots. The course was E. N. E.

The 90-footers carried balloon jib topsails, and booms were eased off to port. Columbia got out into the Sound and benefited by the tide running eastward. She sailed away from the other boats and not for over two hours and a half after the start did Reliance pass her.

Sails were changed several times on the long journey, each skipper endeavoring to get all possible out of his charge. At half past one the wind freshened a bit and hauled into the S. S. E. Baby jib topsails were then sent up and jibs and forestaysails, which were run down when carrying the big balloons, were reset.

At 1:30 Reliance passed to windward of Columbia, and thereafter was never headed. The Iselin boat was then off Eaton's Neck. The wind lightened and the big sloops set larger jib topsails. Not until 4 o'clock did those watching the race think that Constitution would be within winning distance of Reliance.

Reliance was then north of the Middle Ground. The breeze was ruffling the water perceptibly, and came S. by E. The boats had set balloon jib topsails and were moving along at a good gait. Columbia was falling astern fast, while Constitution appeared to be gaining on Reliance.

With the finish line only a mile away, Barr ordered Reliance's spinnaker set to starboard. Captain Rhodes, on Constitution, immediately followed suit. Still Constitution gained. Reliance finished at 5:13:14, Constitution at 5:14:13, and Columbia at 5:20:35. The summary:

	Start.	Finish.	Elapsed.
Reliance	11 32 00	5 13 14	5 41 14
Constitution	11 32 00	5 14 13	5 42 13
Columbia	11 32 00	5 20 35	5 48 35

The other boats were doing well. In the regular classes the winners were the schooners Ingomar and Elmina, the yawl Vigilant (sail over), and the sloops Neola and Aspirant. In the special classes the winning boats were the schooners Hildegard and Katrina, and the sloop Eelin. The summary:

Schooners—Class B.				
	Start.	Finish.	Elapsed.	Corrected.

Saturday, July 18.

SQUADRON RUN.

Morris Cove to New London—39 Miles.

The second run of the cruise from Morris Cove to New London was much more enjoyable and animated than that of the first day. The breeze blew from the south at a good clip, making the 39-mile journey to New London a reach. The wind was of a ten knot strength. The sky was overcast, and there were many signs of rain. The heavens did not unburden themselves, however, until after the yachts had been started some time.

The day was a good one for Reliance, and she finished the journey a winner over Constitution by 6m. 29s. elapsed time. Reliance beat Columbia 16m. 24s. The run was a fast one. Reliance did the 39 miles in 3h. 18m. 28s.

The harbor start was signaled at 8:30 o'clock from the flagship Delaware. One hour later the preparatory signal from the fleet was given from the committee boat Riviera. Twenty-seven boats got away.

The 90-footers were sent away at 10:15 A. M. The yachts had a favorable tide. The wind was six miles an hour blowing S. S. E. Reliance went over the line on the starboard tack 15 seconds after the gun. Columbia to windward crossed at 10:15:40, while Constitution took her handicap time and went over at 10:17.

The Cup boats carried large club topsails. Reliance and Constitution were up to windward well enough to easily make the first mark, Faulkner's Island, twelve miles away. Reliance was abeam of Faulkner's at 11:15. She then led Constitution by 5m. and Columbia by 7m.

Cornfield Lightship was the next point on the journey. This was twelve and a half miles away, and was to be left on the port hand. The old Cup defender Vigilant, now rigged as a yawl, was leading the fleet as this point was passed. She started some distance ahead of the Cup boats. Reliance passed the lightship at 12:17:10, Constitution at 12:20:50, and Columbia at 12:22:25. Up to this stage of the contest Constitution had held Reliance well.

The next mark in the eastward journey was Bartlett's

Reef Lightship, and the distance was twelve miles. The wind hauled slightly toward the southward, making it possible to ease sheets slightly. The Cup yachts changed their jib topsails for larger ones. They were timed at Bartlett's Reef as follows: Reliance, 1:16:45; Constitution, 1:24:57; Columbia, 1:31:25.

The wind was now S. by E. It was 2½ miles E. N. E. to Sarah's Ledge, the next point in the journey, and the finish of the race. Reliance gained constantly in the last miles of the run, and passed by the committee boat anchored off the bell buoy at 1:38:48. Constitution was timed at 1:41:57, and Columbia at 1:50:37. The summary:

	Start.	Finish.	Elapsed.
Reliance	10 15 20	1 33 48	3 18 28
Constitution	10 17 00	1 41 57	3 24 57
Columbia	10 15 45	1 50 37	3 34 52

In the other classes the schooner Hildegard and the yawl Vigilant got sail overs. Neola scored her first victory of the year over Weetamoe, while Queen Mab gave Aspirant her initial defeat. The other winners in the regular classes were the schooners Ingomar and Latona, and the sloop Hebe. In the special classes the victorious craft were the schooners Chanticleer and Latona and the sloop Queen Mab.

The Eastern Y. C. arrived during the afternoon. Commodore Minot was on board the flagship Hope Leslie. Courtesies were exchanged between the two clubs. In the run of the day from Newport of Eastern Y. C. boats, Puritan beat Hoosier, Hope Leslie beat Mavis, Rondina and Undercliff. In the sloop class Cossack won from Heron, Notos, Katonah, Louise and Katherine. The summary of the second day's run of the New York Y. C. cruise follows:

Schooners—Class A.				
	Start.	Finish.	Elapsed.	Corrected.
*Hildegard	9 57 00	2 25 58	4 28 58
Schooners—Class B.

* Handicapped.				

Sunday, July 19.

AT ANCHOR, NEW LONDON.

Members of the squadron were relieved when Sunday morning came. New London harbor was crowded with yachts, and during the height of the heavy wind which broke over the fleet on Saturday night it looked as if serious results might be inevitable. Many craft dragged anchors and swung about. No accidents of a serious nature were reported.

The greater part of Sunday was lowery, the sun not showing its face until late afternoon. A meeting of the committee on America's Cup challenge was held on board ex-Commodore J. Pierpont Morgan's steam yacht Corsair. Several matters of business were transacted, the most important of which was arranging the dates for the official trial races off Newport, after which a defender to meet Shamrock III, will be selected. These trials were originally scheduled to be held over the Brenton's Reef courses beginning July 30.

According to the new arrangement three races will be sailed instead of five as first intended. They will occur on Monday, July 27, Wednesday, July 29, and Saturday, August 1. On Tuesday, July 28, and the following Thursday will occur the Newport series for all classes. These events are open to the Cup boats and they may start.

The regatta committee gave out the way in which the special trophies offered by different members of the club were to be disposed of. These are in addition to the regular prizes for which the yachts race each day.

Vice-Commodore Henry Walters gave a cup to the winner of the first day's run from Glen Cove to Morris Cove, all yachts racing as one class with full allowance for rig according to rules. Rear-Commodore Vanderbilt gave a cup for the second run, which was from Morris Cove to New London. Conditions for this trophy were the same as those for the Walters cup.

For the run from New London to Newport on Monday, Rear-Commodore Vanderbilt gave two cups, one for schooners all in one class, and the other for sloops, cutters and yawls. On the run from Newport to Vineyard Haven on Tuesday, Vice-Commodore Walters offered a special cup for all yachts racing in one class on regular time allowance. He also offered two cups for the return run to the former Rhode Island capital, one for sloops and the other for schooners, and a fine trophy to go to the 90-footer which wins the most runs during the cruise.

Commodore Frederick G. Bourne offered two cups, one

for the schooner winning the most squadron runs, all sailing in one class, and one for single masted vessels and yawls under the same conditions.

On Sunday evening the Commodore gave a dinner on board the flagship to the members of the syndicate which stood the expense of building Reliance, the owners of Constitution and Columbia, the regatta committee and the guests on board Delaware. Included among those at the dinner were: James J. Hill, Henry Walters, W. B. Leeds, P. A. B. Widener, J. Pierpont Morgan, S. Nicholson Kane, Newbury D. Lawton, Edward H. Wales, August Belmont, C. Oliver Iselin, W. B. Duncan, Jr., and E. D. Morgan.

Shamrock Trials.

SANDY HOOK COURSES,
July 13-18.

Shamrock III. had two good trials during the week of July 13, in which she again demonstrated a marked superiority over Shamrock I. The latest Fife creation was in the new rig fitted at Erie Basin. A loftier mainmast made greater sail area possible.

The boats were towed down to Sandy Hook Bay on Monday morning. A drizzling rain fell throughout the day, however, and the wind was light. The Lipton 90-footers remained at anchor. On Tuesday a fifteen-knot breeze was blowing, which gave promise of a fine trial over the 30-mile course. Designer Fife and Sailmaker George Ratsey did not like the set of the new mainsail on Shamrock III., and most of the time underway was spent in trying to better it.

At 12:30 the boats were sent off on a broad reach from Scotland Lightship to Sandy Hook Lightship. They turned the latter and had gotten well back toward Scotland when a masthead runner block on the challenger gave way, and the trial was abandoned for the day. At the time of the accident Shamrock III. had gained a minute and a half in 8 miles of sailing.

The big single stickers were out again on Wednesday. Shamrock III. was in a new suit of canvas, and the spin turned out to be merely for stretching purposes. There was a good breeze blowing at times with prospects of rain and wind squalls, which, however, passed beyond Sandy Hook.

The first real trial occurred on Thursday. The course was a leeward and windward one and aggregated about 40 miles. At the finish Shamrock III. led the first Fife boat by 6m. 30s. Shamrock I. got the better wind in part of the struggle, and this undoubtedly gained minutes for her on the new boat. The course was 10 miles to leeward and return from Sandy Hook Lightship and was covered twice. The breeze at the start was blowing 9 knots, but at the finish had flattened to about three. The summary:

	Start.	1st turn.	2d turn.	3d turn.	Finish.	El'ps'd.
Shamrock III.	11 20 18	12 34 05	2 08 03	3 24 35	4 53 04	5 32 46
Shamrock I.	11 20 33	12 36 14	2 13 48	3 27 23	4 59 34	5 39 01

On Friday the boats sailed 15 miles to windward and return. Shamrock III. appeared to be in much better trim than in the trial the day before, and easily out-pointed Shamrock I. on all sailing. At the finish of the contest she won by 11m. 44s. elapsed time. In beating to windward 7m. 38s. were gained, and on the run home the new boat was 4m. 6s. faster. The summary:

	Start.	Turn.	Finish.	Elapsed.
Shamrock III.	11 35 30	2 21 57	4 14 40	4 39 10
Shamrock I.	11 35 19	2 29 24	4 26 13	4 50 54

The rain and wind of Saturday kept the Lipton fleet in Sandy Hook Bay. The daily spins of the cup challenger and her trial boat are giving Captains Wringe and Bevis an excellent knowledge of conditions encountered off Sandy Hook.

Atlantic Y. C.

SEA GATE, LONG ISLAND,
Saturday, July 18.

In a twenty-five knot breeze from the southeast, an attempt was made to start the race of the Atlantic Y. C. for classes M and under on the afternoon of Saturday, July 18. There was a heavy sea running and a blinding rainstorm. The boats were to cover the short inside courses with marks at Fort Hamilton, Ulmer Park and the start off Sea Gate.

Five craft started, including the yawl Kate, owned by J. S. Negus, and the sloops Cockatoo, W. A. Barstow; Vagabond, T. A. Vernon; Eileen, F. J. Havens; Apuka II., E. S. Tefft, and Pickinenny, E. H. Low. All were double reefed.

Just before reaching the Fort Hamilton mark Pickinenny capsized. Her owner, Mr. Low, and two boys in the crew were thrown into the water. They clung to the bottom of the overturned craft until the yawl Kate came to the rescue. The boys were taken off in safety, and a rope was thrown to Mr. Low, which he grabbed. A particularly heavy sea, however, made the craft lurch. Mr. Low lost his hold and disappeared. He was not seen again. He was popular with all yachtsmen on Gravesend Bay and well-known in the business world. Mr. Low was in his 45th year. He leaves a widow.

After the accident the race was called off. The drowning of Mr. Low was the first fatal accident which has occurred among Gravesend Bay Corinthians for years and has cast a gloom over all.

Lynn Y. C.

LYNN, MASS.,
Saturday, July 18.

A club race of the Lynn Y. C. was sailed in Lynn harbor Saturday, July 18, in a stiff southerly breeze. Winnahdin won handily on both elapsed and corrected times. The summary:

	Elapsed.	Corrected.
Winnahdin, James Spratt	1 07 39	1 07 39
Odd Fellow, G. G. S. Buttrick	1 14 05	1 08 05
Surge, D. Lannon	1 14 15	1 09 15
Spurt, R. P. Badger	1 15 27	1 09 27
Isabelle, C. E. Hodgden	1 16 41	1 10 41
Alice L., Urban Horgan	1 20 31	1 12 31

Newport 30-Footers.

NEWPORT, RHODE ISLAND,
Tuesday, July 14.

Vaquero III., owned by Payne Whitney, and sailed by Harry Payne Whitney, won the race for the Newport 30-footers on Tuesday, July 14. The course was to Dyer's Island and return, a total distance of 18 miles. It was a run out and a beat home. John R. Drexel's Raccoon made her initial start, but did not finish. Vaquero III. soon got the lead and was never headed. The summary, start, 4:04:

	Finish.	Elapsed.
Vaquero III., P. Whitney	6 31 16	2 27 16
Carolina, C. L. F. Robinson	6 38 58	2 34 58
Barbara, W. Rutherford	6 40 47	2 36 47
Raccoon, J. R. Drexel	Did not finish.	

Wednesday, July 14.

Carolina scored a lucky victory in the contest of Wednesday. Vaquero III. repeated her good work of the day before, and led the fleet during the greater part of the race. A shift in the wind, however, gave Carolina a big lift and she won the contest by 2m. 4s. A strong breeze blew throughout. The summary, start 3:46:

	Finish.	Elapsed.
Carolina, C. L. F. Robinson	5 27 52	1 41 52
Vaquero III., P. Whitney	5 29 56	1 43 56
Barbara, W. Rutherford	5 32 23	1 46 23
Raccoon, J. R. Drexel	Did not finish.	

Thursday, July 16.

Harry Payne Whitney continued his good work in Vaquero III. on Thursday, and won a signal victory from the other 30-footers. The course was 6 miles to leeward and return. Vaquero III. led from start to finish. The summary, start, 3:53:

	Finish.	Elapsed.
Vaquero III., P. Whitney	5 16 06	1 23 06
Barbara, W. Rutherford	5 16 55	1 23 53
Carolina, C. L. F. Robinson	5 17 04	1 24 04
Raccoon, J. R. Drexel	5 20 48	1 27 48

Friday, July 17.

As if to make her record of the week a clean one, Vaquero III., in the hands of Harry Payne Whitney, again scored victory in the sweepstake race of the 30-footers on Friday. The event was one of the best sailed this season. A strong southwest breeze was blowing, and all of the starters finished within 30s. of one another. The course was 6 miles to leeward and return. The summary, start 3:50:

	Finish.	Elapsed.
Vaquero III., P. Whitney	5 13 51	1 23 51
Carolina, C. L. F. Robinson	5 14 18	1 24 18
Barbara, W. Rutherford	5 14 27	1 24 27

Indian Harbor Y. C.

GREENWICH, CONN.,
Saturday, July 18.

Out of an entry of twenty, seven power boats came to the line in a southeast gale and rainstorm for the races of the Indian Harbor Y. C. on the afternoon of Saturday, July 18. The starters were as follows: Fifty-foot class, Allure, A. Stein; 40ft. class, Isabel, R. M. Haddock; Queen Bess, R. H. Sterns; Tycoon, E. Norton; Alitus, R. C. Fisher; 26ft. class, Genevieve, John Wilson; Dick, B. Goldfinger.

A 10-mile course was covered. Isabel withdrew at the end of the first round. Queen Bess won in the corrected time of 1:05:30. Alitus was second, with 1:31:39, and Tycoon third, with 1:33:13. Water sports were also held.

Shelter Island Y. C.

SHELTER ISLAND, L. I.,
Saturday, July 18.

In the special races for Shelter Island Y. C. on the afternoon of Saturday, July 18, George Trowbridge Hollister's class N boat Kalmia, defeated Otto E. Lohrke's Senta by 1m. 5s. In class R Howard Keims's Arrow was victorious. The other starters in this class were Snook, W. W. Decker; Flash, N. Schickel; Harp, Ralph Peverly, and Iris, G. Piel. Psi, Andrew Bancker, withdrew. The race was sailed in a wholensail breeze from the southwest, and a smooth sea, over the regular club course in Gardner's Bay. Rain fell throughout the race, but the wind was not heavy until late in the afternoon, when it blew almost a gale. Sub-class R did not start.

Erie Y. C.

THE yachts of the Erie Club sailed their first of a series of five races that have been arranged by the regatta committee on Saturday, July 11. There was no wind and it turned out to be a drifting match.

30ft. Class—Start, 2:35.		Finish.
Una	5 16 40	Viking 5 36 40
King Fisher	5 22 05	
25ft. Class—Start, 2:40.		
Mingo	5 09 50	Marvel 5 19 33
20ft. Class—Start, 2:45.		
Turtle	5 18 55	Zephyr Withdrew.

Course the usual inside triangular 7 miles. The small dinghys did not start through some mistake in the time. They will be sent out in the next race though on Saturday, July 25.

CABIA BLANCO.

South Boston Y. C.

SOUTH BOSTON, MASS.,
Saturday, July 18.

A race of sailing tenders of the South Boston Y. C. was sailed Saturday, July 18, in a stiff southwest breeze, the Merrill tender winning. The summary:

	Elapsed.	Corrected.
Merrill	0 40 04	0 39 19
Stickney	0 42 04	0 41 40
Colson	0 43 26	0 43 26
Trotman	0 46 02	0 43 56
Weinman	0 50 11	0 45 11

Riverside Y. C.

RIVERSIDE, CONN.,
Saturday, July 18.

Despite a heavy wind and downpour of rain, twenty-five yachts were at the starting line for the fifteenth annual regatta of the Riverside Y. C. on the afternoon of Saturday, July 18. At the time the yachts were sent away the breeze was blowing across Long Island Sound from the southeast at a 25-mile velocity.

There were two accidents during the day, one of which might have proved serious. During the second leg of the 9-mile course covered by the smaller craft, A. F. Gotthold's 21-footer Ibis was totally dismasted. She was towed ashore by the committee boat Union. In making fast a hawser to her a deckhand on the steamer was washed overboard. He was rescued in an exhausted condition. The Seawanhaka knockabout Lucille carried away her rudder, but managed to finish without assistance.

The winners in the different classes were Spasm, Alert, Sis, Firefly, Jeebi, Plover, Ace and Lambkin. The larger yachts were sent around a triangle of 18 nautical miles. The raceabouts had a journey of 14½ miles, while the other yachts sailed a 9-mile triangle. The start and finish of all classes was a point to the eastward of the gas buoy off Little Captain's Island. With the breeze in the southeast the boats had a beat to the first mark, a reach to the second and a run home. The summary:

Sloops—36ft. Class—Start, 1:35.		Finish.	Elapsed.
Anoatok, W. G. Brokaw	4 03 00	2 28 00	
Spasm, E. D. King	3 58 52	2 25 52	
Spasm allows Anoatok 2m. 43s.			
Sloops—30ft. Class—Start, 1:40.			
Alert, J. W. Alker	4 10 20	2 30 20	
Flosshilde, W. D. Hennen	Did not finish.		
Raceabouts—Start, 1:50.			
Jolly Roger, E. Bluecher	4 06 28	2 16 28	
Rascal, S. C. Hopkins	4 05 28	2 15 28

Beverly wins race and match.

Mosquito Fleet Y. C.

SOUTH BOSTON, MASS.,
Saturday, July 18.

The first handicap race of the Mosquito Fleet Y. C. was sailed in Dorchester Bay, Saturday, July 18, in a stiff southerly breeze. The starts were good in each class. In the first class Alcyone won handily and Thistle won in the second class by over 2m. The summary:

First Class.		Corrected.
Alcyone, F. W. Coombs	1 26 23	1 26 23
Eleanor, H. K. McSweeney	1 32 25	1 32 25
Sentinel, N. C. Robinson	1 35 24	1 35 24
Aida, C. P. Mooney	1 36 34	1 36 34
Egeria	1 43 35	1 43 35
Second Class.		
Thistle, C. R. Small	1 49 15	1 49 15
Albatross, George Carson	1 51 37	1 51 37

Regatta Postponed.

Regattas scheduled to take place at the Bensonhurst Y. C. on Gravesend Bay and at the Penataquit-Corinthian Y. C. at Bay Shore, L. I., on Saturday, July 18, were postponed because of the heavy wind and rainstorm raging.

Philadelphia-Corinthian Y. C.

PHILADELPHIA, July 16.—The Race Committee announces the following squadron runs during the annual club cruise. When the commodore has ordered the squadron underweigh, the committee will establish the start and finish lines, which will be between a white flag on the committee boat and the points indicated below:

Saturday, July 25.—Glen Cove to Oyster Bay.
Sunday, July 26.—The fleet will remain at anchor at Oyster Bay.
Monday, July 27.—Oyster Bay to Morris Cove.
Tuesday, July 28.—Morris Cove to Shelter Island.
Wednesday, July 29.—Shelter Island to New London.
Thursday, July 30.—Races at New London for gigs, dinghys, launches and small sail boats belonging to yachts of the squadron.
Friday, July 31.—New London to Newport.

Racing Signals.—8:55 A. M. Preparatory signal—Blue Peter. 9 A. M. White Ball—Start for classes G, H, J, K, L, M, of sloops, cutters and yawls. 9:10 A. M. Red Ball—Start for class F of schooners. 9:20 A. M. Blue Ball—Start for classes A, B, C, D, of schooners.

For more specific details reference should be had to the racing rules of the club.

Rendezvous (July 24).—The John Nichols, ocean-going tug, will leave Adams Express Co.'s Wharf, Pennsylvania Railroad, Jersey City, after the arrival of the train leaving Philadelphia at 1 o'clock, via Pennsylvania Railroad. Yacht owners (and guests) wishing to reach the rendezvous with the purpose of making the cruise, may avail themselves of her privileges, notifying their gigs to board her on reaching Glen Cove.

The John Nichols will serve as the Committee Boat during the cruise. Members (and guests) wishing to use her for runs from port to port, will notify the committee, who will be on board on the evening preceding the run.

ADDISON F. BANCROFT, Chairman;
HARVEY J. MITCHELL,
JOHN A. INGLIS, Race Committee.

Sales and Charters.

The following sales have recently been made through the agency of Hollis Burgess, of this city:

The 46ft. waterline auxiliary yawl Alborak, owned by W. Starling Burgess, of Boston, to the Hon. Frank W. Rollins, of Concord, N. H., ex-Governor of New Hampshire.

The 30ft. waterline yawl Katharine, owned by the Hon. Frank W. Rollins, of Concord, N. H., ex-Governor of New Hampshire, to W. Starling Burgess, of Boston.

The Bar Harbor 25-footer Redwing, owned by T. G. Condon, of New York, to Dr. Chas. H. Frazier, of Philadelphia.

The 21ft. knockabout Bogie, owned by Howard Whitcomb, of Boston, to E. W. Judd, of Hebron, Maine.

The 21ft. raceabout Scapegoat, owned by C. H. W. Foster, vice-commodore of the Eastern Y. C., to Walter P. Keyes, of Hull, Mass.

The 18ft. knockabout Ayaya, owned by Walter P. Keyes, of Hull, Mass., to Henry D. Sharpe, of Providence, R. I.

The 30ft. waterline yawl Katharine, owned by W. Starling Burgess, of Boston, has been chartered through the same agency, to George L. Batchelder, of Boston.

Mr. Thomas A. St. Johnston, of this city, has chartered for Mr. George W. Childs Drexel, of Philadelphia, his steam yacht Alcedo to Senator John F. Dryden, of New Jersey. This yacht measures 200ft. over all, 174ft. waterline, 24ft. 6in. beam, 13ft. depth and 11ft. 6in. draft. It was built of steel in 1897 by the Harlan & Hollingsworth Company, of Wilmington, Del., for Mr. Drexel. It has triple expansion engines by the same company, and four Almy water tube boilers. Signal letters K. N. C. R.

The following sales, charters, etc., have been effected through the office of B. B. Crowninshield, of Boston:

Design of 50-ton fishing schooner for the Mobile Fish & Oyster Co., of Mobile, Ala. This vessel will be called the Virginia Lyons, and will be very similar to the schooner Stranger, which was recently built and launched for Mr. Crowninshield, et al, and will be one of a fleet that will be built and launched for this company for use in the Gulf of Mexico.

The 21-footer Bohemia, for Eliot Wadsworth, to Francis Parker.

An order for a design for an 18ft. knockabout, to comply with the 18ft. Knockabout Association rules, for F. D. Bowden.

The 60ft. launch Kiwi, sold to A. J. Van Nostrand, of New London, Conn.

The 30ft. sloop Tsatsawassa, sold for O. B. Cole, of Boston, to William Borden, of Chicago.

Chartered the schooner Adrienne for Mr. Harry Smith to Mr. M. J. Markham.

Canoeing.

A. C. A. Amendments.

BROOKLYN, N. Y., July 17.—Editor Forest and Stream: The following amendments to the Constitution and By-laws of the American Canoe Association are proposed, to be published for the specified time, and then acted upon by the American Canoe Association and by its Executive Committee at the annual camp at Sugar Island, Aug. 7 to 21, 1903, as per Article XII. of the Constitution and Chapter XIV. of the By-laws. The references hereafter to pages and to lines on said pages are according to the Year Book for 1902.

ROBERT J. WILKIN,
A. C. A., No. 47

Constitution.

Article III. Amend fourth line by substituting "Treasurer" for "Division Purser."

Article V., Sec. 1, in second line, substitute "a Secretary and a Treasurer" for "a Secretary-Treasurer."

Sec. 2, in first line, put "and the Secretary and the Treasurer" for "and the Secretary-Treasurer." Strike out all after the word "Committee" in third line, to and including the word "elected" in eighth line, and substitute therefor: "The term of office of the Commodore shall be for one year from the first day of October in the year in which he is elected, and the terms of office of the Secretary and of the Treasurer shall end when their successors are elected."

Article VI. Strike out all after the word "Division" in fifth line of Sec. 1, to and including "Association" in seventh line, and substitute "The officers of the Association, and the Division Vice-Commodores and Pursers shall constitute the Executive Committee of the Association." In ninth line of Sec. 1, substitute "a Secretary and a Treasurer" for "and Secretary-Treasurer."

In Sec. 2, substitute "five" for "seven" in first line.

Section 5, substitute "Treasurer" for "Secretary-Treasurer" in fifth line.

Strike out the word "Secretary" in amendment passed last fall, relative to Life Membership (not published in 1902 book).

Article VII, in twenty-second line, substitute "the Secretary's and the Treasurer's" for "the Secretary-Treasurer's."

Article IX, Sec. 1, strike out the word "Treasurer" in first and second lines, also, all after "Book" on fifth line, and substitute a new Sec. 2, as follows: "It shall be the duty of the Treasurer to receive all moneys due the Association from every source, to pay all proper bills on the written approval of the Commodore, and to make an annual report of the finances."

Substitute new Section 3 for present Section 2.

Amend new Section 3 by inserting after the word "receive" on the first line, the words "from the Treasurer."

In the third line, strike out "from the members" and substitute "their Divisions."

In the fourth and sixth lines strike out the word "Treasurer."

Strike out all the section after the word "Division" in the eighth line.

Strike out the word "after" in seventh line of that section and substitute therefor, "prior too."

By-Laws.

Chapter I, Sec. 1, strike out "Division Pursers" in second line, and "Purser" in fifth line, and insert "Treasurer" in each case.

In sixth line of same chapter, strike out the word "Vice."

In Section 2, second line, after the words "January 1st," add "to the Treasurer." In third line, add, after "if not paid," the words "by February 15th." In fourth and seventh lines, substitute "Treasurer" for "Purser." In seventh and ninth lines, strike out the word "Vice." In eleventh line, substitute "Treasurer" for "Purser."

Section 2, first line on page 22, strike out all on first and second lines after the word "year," and substitute all of the "note" now at the end of Chapter I, commencing: "The receipts for the Division in which," etc. In sixth line, page 22, strike out "and Secretary-Treasurer."

Chapter V, seventh line, strike out the word "Treasurer," and add: "that of the Treasurer to be blue, with

the same device in white." In fourth line of same chapter, strike out "a star," and insert "three stars."

Chapter VII, strike out the word "Treasurer" in first line. In second line, strike out "after each annual meeting of the Executive Committee" and substitute: "each year, as soon after April 15th as may be possible." In sixth line, add, after "and shall send," the words: "a sufficient number of copies to the Pursers of each Division for distribution to the members thereof; the postage to be paid by said Divisions." Add to Chapter VII, the following: "The Secretary shall publish, each year, not later than July 1st, a "prospectus" of the forthcoming annual camp, with all requisite data from the Camp-site, Transportation and Regatta Committees, and shall mail a copy to each member of the Association.

Chapter VIII, third line, page 23, strike out the word "Treasurer."

Chapter IX, twenty-eighth line, strike out "Treasurer." In twenty-ninth line, add: "and a detailed report of the expenses of such regatta, with accompanying vouchers to the Treasurer."

Chapter X, sixth line, strike out the word "Treasurer." In seventh line, add: "And of the Treasurer, the letters A. C. A. in silver, supported by a quill in gold."

Chapter XI, substitute "Secretary" for "Librarian-Custodian" in first line.

Chapter XII, eighth line, strike out the word "Treasurer."

A. C. A. Membership.

The following have applied for membership to the A. C. A:

Atlantic Division—F. M. Crispin, Paul McMichael.
EDWARD MULLER, Purser.

Rifle Range and Gallery.

The United States Revolver Association.

NEW YORK, N. Y., July 15.—Herewith I send you the scores of the second Franco-American revolver match; also the details of the new revolver record made by Dr. William H. Luckett, of this city.

A. L. A. HIMMELWRIGHT.

The American team shot their scores at the Walnut Hill range of the Massachusetts Rifle Association, near Boston, Mass.; the French team shot at Paris, France. The total scores of each team to be cabled to the other.

Scores of the American team:

A. L. A. Himmelwright, captain.

Substitutes: C. F. C. Armstrong, A. R. Whittier, Wm. H. Luckett.

Umpires representing the French team: Elmore A. Pierce, of the Associated Press, and W. F. Spencer, statistical officer of the Massachusetts Rifle Association.

French team, total scores: M. Balme 469, M. Gaurrette 502, Capt. Chauchat 524, Count de Chastellajae 547, M. Dutfoy 541, M. Feugray 509, M. Recoq 502, M. Louvier 496, Molinier Paget 526, Capt. Moreaux 529, Adj. Paroche 466, Commandant Py 542, M. Sartori 462, M. Dorien 522, M. Despasses 503; total 7640.

Programmes giving the conditions of these matches may be obtained by addressing H. W. Ott, Box 162, New York city.

The score and other details of the new 50-shot revolver record at 20yds., shot by Wm. H. Luckett, at the Manhattan Rifle and Revolver Association gallery at 2628 Broadway, on June 11, 1903, follow:

W H Luckett.....	7 8 8 9 9 10 10 10 10—91
	8 8 9 9 9 10 10 10 10—93
	8 8 8 8 9 10 10 10 10—91
	8 8 9 9 10 10 10 10—93
	8 9 9 10 10 10 10 10—96—464

The shooting was done on the regulation Standard American target, reduced for 20yd. shooting, with a Smith & Wesson .44cal. revolver, with an 8in. barrel and a trigger pull of 2½lbs. Plain open sights; reloaded smokeless gallery ammunition, with round ball. The first shot of the score was fired at 10:45 P. M., and the last shot at 11:31 P. M. The shooting was witnessed by Joseph E. Silliman, treasurer of the Manhattan Rifle and Revolver Association, and Mr. B. F. Wilder. This score was fired strictly in accordance with the rules and regulations of the United States Revolver Association, and is recognized as the 50-shot revolver record.

The annual championship matches of the United States Revolver Association will be held simultaneously with the annual meeting of the National Rifle Association of America, from Sept. 2 to 11, inclusive. These matches will be shot at the Sea Girt range of the New Jersey Rifle Association, at Sea Girt, N. J.; at the Walnut Hill range of the Massachusetts Rifle Association, Woburn, Mass., near Boston; at Chicago, Ill., under the auspices of the Chicago Sharpshooters' Association; at St. Louis, Mo., under the auspices of the St. Louis Sharpshooters' Association, and at San Francisco, Cal., at the Shell Mound range of the Golden Gate Rifle and Pistol Club. These matches are open to all.

Rock Island Club.

ROCK ISLAND, ILL., June 16.—The club will hold at its Elm street range a class shoot with .22cal rifles, 100 shots. The contest will begin Saturday afternoon, July 4, will continue on Saturday afternoons for twelve weeks, and is open to all members in good standing.

This shoot will be known as "the Stevens Rifle Contest," and the principal prize will be a fine rifle, donated by the J. Stevens Arms & Tool Co.

The Standard American target, reduced to 100yds., will be used in this match. There will be no individual targets, but the marking will be careful and scores will be verified by one of the following committee: Mitchell, Reidy, Harms, Junge and Helpenstell.

Each contestant may fire, on any regular day, as many shots,

Distance 100 yds.; caliber rifle .22; Standard American target.
C. W. DURHAM, Sec.

Fixtures.

Mr. Wm. Dutcher writes us as follows: "The Jackson Park Gun Club, of Paterson, N. J., is preparing a programme for an all-day shoot, to take place on Saturday, Aug. 8, beginning at 10 A. M. An attractive programme will be provided for all those taking part in the day's sport. The Wanderers' Club will be the guest of the Jackson Park Gun Club on that day, and the boys are looking forward to a great day at the traps, and a pleasant outing for all those who may be so fortunate as to be with us on that day. Everything will be well looked after, so that there shall be nothing found wanting after the day is done. The Wanderers' handicap will be one of the features of the programme, and lunch will be served on the grounds. Shells can be obtained on the grounds. Take electric cars at City Hall. Singac cars for Jackson Park every fifteen minutes will land you at grounds in ten minutes."

W. P. T. S. L. at Ligonier.

LIGONIER, Pa.—The eighth tournament held at Ligonier, Pa., under the auspices of the Western Pennsylvania Trapshooters' League, was a grand success. Sixty-eight shooters faced the traps the first day. The weather was fine, and the whole affair was simply grand. "Pap" Denny held his end up fine, and occasionally smoked a coffin tack, and looked around among the "bunch" and chuckled quietly to himself, saying, "What a lovely bunch of boys I have under my care."

In the evening the crowd was entertained by the city band, and every shooter, as well as the town folks, formed two abreast and marched around the band stand, which was situated in the Park, headed by Frank Butler and Charley Grubb. Elliott was high professional, with Crosby as a close second. Watson was high amateur, with Atkinson and Garland as close seconds.

Six teams entered the race for the League trophy; Ruffsedale won. The Ligonier Rod and Gun Club extend their hearty thanks to Messrs. Frank Lawrence, Howard Sargent and Chas. Grubb, who acted so ably as squad hustlers, and Mr. Louis Lautenslager as cashier, and Mr. Bill McCrickart, assistant and score compiler.

The trade was represented by Louis Lautenslager, L. J. Squier, Frank Lawrence, Elliott, Billy Crosby, Howard Sergeant, Harry Stevens, Frank Butler, Ed Fulford, Charles G. Grubb, Neaf Apgar, Jack Hull and Gus Greiff.

On the third day squad No. 1—Elliott, Fulford, Apgar, Crosby and Stevens—in event No. 1, broke 75 targets straight. The score, on one of Grubb's new patent score sheets, now ornaments the club house.

The Ruffsedale Gun Club won the team event.

First day, professional high guns: Apgar 171, Elliott 168. Second day, Crosby first, Elliott second. Third day, Elliott first, 134 out of 135; Crosby, second, 133.

Amateur high guns, first day: Lutz, first, 167; Atkinson, Watson and Joe tied and divided second on 159. Second day, Watson 166, Joe 161. Third day, Cochran 132, out of 135, Watson 131.

Following are the scores:

July 7, First Day.

Other shooters were in the contest and made fair records, though not up to those mentioned.

July 9, Third Day.

Sixty-eight were entered. Elliott, out of 135 shots, missed but one. The prizes were awarded to-day. The winners were Bessemmer, \$50; Pontefract, \$15; Fleming, \$20, and many others smaller

articles, such as shooting jackets and vests, leggings, gun cleaners, etc. To-day's best scores were:

Bonesteel Gun Club.

BONESTEEL, S. D.—The midsummer shoot of the Bonesteel Gun Club, which was pulled off on July 14, was a perfect success, despite the fact that it was a jumped up affair, with only three days' notice, and really given in honor of Mr. Le Roy Leach, of Woodlake, Neb., who is on a visit to his brother, Mr. W. A. Leach, cashier of the Citizens' Bank of Bonesteel.

The programme consisted of seven 15-target events, \$1 entrance each; four moneys, Rose system, 5, 4, 3, 2; and the championship of Gregory county for the Peters Cartridge Company's trophy between Cliff Law, challenger, and E. E. Jones, holder, winding up with an exhibition of fancy rifle shooting by Mr. Le Roy Leach, of Woodlake. The entire programme was carried out in five hours.

The following gentlemen were in attendance: Messrs. T. J. Thompson, Carl Porter, Orion Porter, Geo. Baker, E. L. Cantwell, of the Fairfax Gun Club; B. A. Roberts, of the Albion, Neb., Gun Club; Le Roy Leach, of the Woodlake Gun Club, and W. A. Leach, C. Law, W. W. Law, E. E. Jones, S. F. Lucas, W. S. McLain, of the Bonesteel Gun Club. With the exception of the Messrs. Law, who arrived too late for the first event, the entire party shot through the entire programme, except Mr. McLain, who is a beginner.

Mr. Le Roy Leach took about everything in sight, making high average on 94 out of 105 shot at, or 90 per cent., the nearest man to him being 11 birds behind. He also made the highest consecutive run ever made on the grounds of the Bonesteel Gun Club. Beginning with bird No. 4 in event No. 3, he never made a skip until the fifteenth bird in event No. 5, or a straight run of 41, which was all the more remarkable when it is considered that a stiff wind was blowing all day in the shooters' faces, and that the targets were thrown 60 to 65yds. on a ground that is naturally difficult.

Mr. Leach followed this up by hitting 70 out of 75 2in. wooden blocks, and then proceeded to make souvenirs for his friends by shooting pennies tossed into the air with single bullets, and which, such of them as could be found, were carried off by the spectators for pocket pieces.

Second high average went to Thompson and C. Porter, of the Fairfax Gun Club jointly.

Fourth high average went to Mr. Geo. Baker, and as this was that gentleman's maiden effort at the traps in competition he must be considered a comer, as he made some of the

WESTERN TRAP.

Garfield Gun Club.

CHICAGO, July 18.—The appended scores were made to-day on our grounds on the occasion of the sixth trophy shoot of the second series. Dr. Meek carried off the honors in Class A on 22. F. H. Wolff won Class B on 23, while McKinnon won Class C on 17. The day was an unusually fine one for trapshooting. Temperature just right, and just enough breeze to make it pleasant. Attendance was only fair, considering the conditions, eighteen shooters only showing up for the sport:

Johnson	11100111011111010001011	17

The Ashdown Gun Club.

WINNIPEG, Man., July 15.—We attach herewith cutting from one of our daily papers, which we think might interest some of your readers for the novelty of it. In this Northern Land our evenings are much longer than in the South, as you will notice by the time at which we stopped shooting.

The Ashdown Gun Club last night inaugurated a novel way of enjoying trapshooting, by lashing a scow to the port bow of the steamer Alexandra and affixing expert traps to the front of the scow from which clay birds were thrown. This is without doubt the first time that trapshooting has been undertaken in such an interesting way, and the Ashdown Club purpose repeating the trips throughout the season.

The boat left the foot of Lombard street at 7:30, and proceeded down the river. After Louise bridge had been passed, the first trap was sprung by Mrs. J. A. Lindsay, wife of the president of the club. Mr. Lindsay fired at and broke the bird, and from then until 9:30 the traps were kept at work. Two full hours of shooting after half-past seven at night is also rather novel, but that is a feature of Manitoba. The birds were thrown well forward, thus eliminating any danger whatever of the shot reaching shore.

The trip was as far as St. Paul's Industrial School, and Wingston's orchestra enlivened the trip down. There were 375 passengers on board, a large number of whom were ladies, and dancing was indulged in on the return trip. Two shooting squads were formed, one of which shot at 15 birds, and the other at 10, and the following scores were made:

Ten birds: D. Nimmons 10, F. Gates 9, R. J. McKay 8, G. A. Britton 8, C. Holden 8, G. Edgar 7, J. Wilson 7, G. McKenzie 6, B. Sinclair 6, R. W. Holland 6, J. Reeves 6, L. Mabb 6, C. Lightley 5, J. H. Thompson 5, J. Peters 5, J. Smith 4.

Fifteen birds: F. Cadham 14, M. J. Miller 13, C. Rutley 13, L. H. Hamilton 12, R. Girdlestone 12, S. Tait 12, P. Turner 11, L. Burtch 11, W. Gates 11, G. Hargrave 10, J. Drew 10, A. G. Carter 10, J. Bourgouin 9, W. Hall 9, H. Scott 9, G. Wilson 9, Bell 8, H. Beliveau 8.

THE ASHDOWN GUN CLUB.

Duluth Gun Club.

DULUTH, Minn., July 13.—Inclosed please find tabulated scores made on the Duluth Gun Club grounds, July 11-12. Saturday was a matinee complimentary to visiting trade representatives, and Sunday the boys held their semi-monthly contest for club medals:

Scores July 11:

Riehl	25	23	21	23	—92	Jackson	24	15	18	13	—70
Lord	22	22	23	21	—88	Cop	20	20	21	22	—83

Binghamton Rod and Gun Club.

BINGHAMTON, N. Y., July 10.—In our team shoot to-day over forty shooters participated, all of the home club. What club can beat this for attendance?

We shall give a one-day tournament the day following the Interstate at Scranton, Pa., making our tournament come on Sept. 25.

Team shoot, eighteen men on a side, 25 targets per man; Brown's team won by 24 points:

Brown (Captain)—Church 22, Heller 21, Fowler 19, Tripp 19, Haddell 18, G. Moffatt 17, Sawyer 17, Beardsley 16, Bromley 16, Cole 16, Everett 16, Kendall 15, Wagner 13, Lillie 12, Clark 11, Best 10, Faatz 8; total 287.

J. Legge (Captain)—Slatter 19, C. Moffatt 18, Weslar 18, Bowen 17, Quick 16, Parker 16, Callahan 15, Chaffee 16, Edison 14, Nash 14, Perry 14, A. Legg 13, Mosher 13, Aldrich 12, Cronin 10, Barton 10, Stewart 7; total 263.

H. W. BROWN.

Cincinnati Gun Club.

CINCINNATI, O., July 11.—The small attendance was caused by the extreme heat. Many members being out of town, those present more than made up for lack of numbers by shooting five extra events.

The twenty-sixth contest for the Troisdorf medals resulted as follows: Harris (16) 44, Williams (18) 42, Medico (18) 42, Gambell (21) 41, Ahlers (21) 41, Jack (16) 41, Falk (18) 40, Herman (16) 39, J. B. (18) 37, Corry (16) 37.

Team race, 50 singles:

Medico (Captain) 43, Herman 42, McB. 39, Williams 38, Harris 38; total 200.

Ahlers (Captain) 35, Gambell 45, J. B. 44, Jack 38, Corry 31; total 193.

Team race, 30 singles and 10 pairs:

	Singles.	D'bles.		Singles.	D'bles.
Medico	30	15	Gambell	26	14
Ahlers	24	15	Faran	26	12
	54	34—84		52	26—78

Van Ness 27 17
Grace 25 13
..... 52 30—82

Thirty singles and ten pairs, two high men out:

	Singles.	D'bles.		Singles.	D'bles.
Gambell	29	16—45	Ahlers	23	16—39
Van Ness	27	17—44	Faran	25	13—38
Medico	28	15—43			

Fifty singles, high man out: Medico 48, Faran 46, Gambell 44, Davies 43, Van Ness 42, Ahlers 39.

Team race, 12 pairs:

Gambell 15, Harris 14; total 29.

Medico 16, Williams 13; total 29.

Shoot-off at 3 pairs: Gambell 6, Harris 3; total 9.

Medico 3, Williams 3; total 6.

Boston Gun Club.

BOSTON, Mass., July 15.—The second last shoot of the Boston Gun Club was held at Wellington to-day, the fine weather conditions bringing out a nice attendance. The scores as a rule ran higher than usual on these grounds, and the match contained some very creditable scores.

Frank, Spencer, and Gleason each tied for first place, though only one target to the rear was Lee, just now seeming to strike his gait, which is quite a satisfaction, as Lee has not been shooting in proper form for some time. The old pump gun, however, seems to have overcome the obstacles in its path, and now Lee proposes to make others hustle. Other scores as follows:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	15	5p	10	15	5p	10	10	15
Frank, 18	6	8	11	9	8	13	8

Charleston Tournament.

CHARLESTON, Ill.—The central eastern part of Illinois has a number of good cities in which are flourishing gun clubs; yet for lack of proper advertising or for something wrong with the programme there was rather a small attendance at the Charleston, Ill., shoot, July 15.

The events were mostly 10 targets, and those present shot through only in part. Mr. Sharff was the high man, while Miss King, the St. Louis champion, made a fine showing. Mr. Smart was high for the home boys, though busy with the management.

Leslie J. Standish was on hand, and made himself generally useful. The Illinois tournament would be void of at least one attraction should Leslie fail to reach any of them with his big grip full of advertising matter. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	10	10	12	15	10	10	10	12	10	10	10

THE HIGHER ANGLING.

THE signs of modern times, in a fishing way, seem to indicate the decadence of the higher angling; for there are two kinds of angling in practice—one of which is devoted to the actual catching of the fish, and therefore is largely physical; the other to the embellishment of the fish and the ethical technicalities of their actual catching, and therefore the higher angling is a matter largely existing in the mind of the catcher.

The fishy idea may justly be termed the higher angling, and is the part of it which seems to have reached a stage of decadence. Or it may be that the fish, alas! are not the same that they were in the good old days.

Where now do we read of the spirited struggles between man and fish? Where now is the giant brook trout or bass, which, with the strength of an ox, the speed of a greyhound, the cunning of a fox, and the endurance of a tax collector, swirled about the bank or boat in concentric circles till dizziness supervened and jeopardized its occupants; or which sulked sturdily at the bottom of the river or lake, defying all angling attempts whether gentle or rude; or which shot swiftly directly at the angler, thereby making yards of slack line, and disconnecting and rattling everything mental and physical in the angling combination?

Of the higher angling, where now is the hiss of the hot line as it cut its smoky way through the water; the furious war song of the reel; and where is that masterpiece of angling strategy, the "giving him the butt;" all to be crowned, at last, when victory was all but in hand, by the fish breaking away?

And, in the higher angling, the trout then was such a whale! There may be as good fish in the sea as ever were caught, but there are no fish in the waters equal to those which were caught if they had not broken away.

Alas, it is regrettable that the higher angling seems to be in its decadence. The beauties and benefits of it were not limited to the times and places of the actual happenings. They were universal and continuous. It was the true highest mountain peak of sport.

There are many other sportive arts of civilization and savagery which owe their origin and existence to man's craving for a test of his personal prowess against that of his fellows, or against the force and craft, relatively inferior, of the wild animals of earth, air and water. The manner of contest has many forms. Some, as football, baseball, polo, etc., are mimetic of wars, strategy and on-slaughter. However, all athletic sports, properly conducted, are of priceless value in developing the powers of the body with a corresponding benefit to the powers of the mind. Still, they are not the superlative of true sport. Or they were not till the decadence of the higher angling.

Of all the sports in times past, none could compare with the ancient, gentle higher art. Of it, one may truly aver that the sun never sets, never has set and never will set on its devotees. Men may come and men may go, but the gentle art stays with us, notwithstanding the embellished higher angling may be a lost art. If lost, it is irreparable. It combined within itself all the essential virtues of all the other arts. It possessed the best elements of what was recreative, developmental and contemplative, thus beneficially affecting both mind and body of man.

While, as he was comfortably seated, a man's eyes were dreamily gazing into the water, when enjoying the higher angling, his mind might be climbing the clouds. No one in the higher angling was immune from its benefits.

If the veriest dullard sallied forth a-angling, and thereafter hiked back, he was a dullard no longer. He then had swarms of nimble thoughts; his mind took exalted and all-seeing flights pitched in a key noble, grand, majestic; his visions were intermingled with poetry and music; his style of expression was changed from the commonplace to the exaltations of hyperbole, and the details of his speech were ramiflorous, prismatic and ample.

To all men, the higher angling, when properly acquired, brought greater mental horizons—an uplifting out of themselves into the full brotherhood of mankind. Any true devotee of the higher angling, if he did not tell where his favorite fish pool was situate, would delight all listeners by telling how the fish were caught. The length and breadth of the narrative were measured only by the amount of time which the audi-

ence could spare, or by its powers of physical endurance.

So either the higher angling is in decadence or the fish are no longer what they were in the good old days. The swirls, the crimson sunsets, the screeching reels, the bent rods, the hissing lines, the demon fish, good old compounds all, these seem to have belonged to a stream of angling literature which has been fished out.

MAIZE THIEVES.

AN early and observant traveler in North America was Peter Kalm, a Swedish botanist and a friend of the great naturalist, Linnæus, whose name was used to characterize the American laurel. Kalm journeyed in America in the years 1748-1751, having been sent here to collect specimens of plants and their seeds, with which to carry on experiments in the acclimatization of various species in Sweden. It was not only for plants that Kalm had a keen eye. In his work, "Travels in North America," published at Stockholm on his return to Sweden, he set down a mass of observations on many subjects, but especially on natural history. Among these items, interesting in themselves as well as for the quaintness with which they are set forth, are many on the birds, and because he was a friend of Linnæus, Kalm had in many cases a very clear idea of the birds which he saw, and of their systematic position in the ornithology of the day. In a recent number of the Auk, Mr. Spencer Trotter has called attention to Kalm's ornithological observations as given in the first English edition of his work, which was translated from the Swedish by John R. Foster, an English naturalist.

If it is true, as suggested by Mr. Trotter, that Peter Kalm's observations have little value at the present day, it is also true that their freshness makes them interesting to all lovers of nature and of outdoor life. His accounts of certain birds were used by Linnæus, the tenth edition of whose great work was published in 1758, the date of the twelfth edition being 1766.

It is interesting to note that at the time when Kalm visited America, it was already seen that the coming of the white people had greatly reduced the number of the birds. While sailing up New York harbor between Staten Island and the town of New York, he saw wild ducks on the water in immense quantities, yet in another place he says: "But since the arrival of great crowds of Europeans things are greatly changed: the country is well peopled and the woods are cut down; the people increasing in this country, they have, by hunting and shooting, in part extirpated the birds, in part scared them away; in the spring the people still take both eggs, mothers and young indifferently, because no regulations are made to the contrary. And if any had been made, the spirit of freedom which prevails in the country would not suffer them to be obeyed." Again, speaking of cranes, and writing from a point in New Jersey a few miles below Philadelphia, and almost opposite the city of Chester, he says: "Certain old Swedes have told me that in their younger years, as the country was not yet much cultivated, an incredible number of cranes were here every spring; but at present they are not so numerous. Several people who have settled here eat their flesh when they can shoot them." These were perhaps whooping cranes.

In those days the wild turkey was abundant along the Atlantic Coast. Their eggs were found in the woods and often hatched under domestic turkeys, giving a larger and far more palatable table bird. Kalm tells us that the Indians tamed wild turkeys and kept them near their homes.

Not a little is said as to the damage done to crops by the various woodpeckers, the crows, and the blackbirds, called by the Swedish settlers "maize thieves." These maize thieves were the red-winged blackbird, the purple grackle, and even the bobolink, which Kalm calls the white-backed maize thief. He tells how the people of New England almost extirpated these birds because of their destruction of the Indian corn, and how, after this had been done, "in the summer of the year 1749 an immense quantity of worms appeared in the meadows which devoured the grass and did great damage," so that the people "abated their enmity against the maize thieves; for they thought they had observed that those birds lived chiefly on these worms before the maize is ripe, and consequently extirpated them, or at least prevented their spreading too much. They seemed, therefore, to be en-

titled, as it were, to a reward for their troubles. But after these enemies and destroyers of the worms (the maize thieves) were extirpated, the worms were at liberty to multiply; and therefore they grew so numerous that they did more mischief now than the birds did before. In the summer of 1749 the worms left so little hay in *New England* that the inhabitants were forced to get hay from *Pennsylvania* and even from *Old England*."

From which it appears that even in the good old times there was an unfortunate and expensive misapprehension of the office of the birds in their relation to agriculture; and out of the ancient books of travel we may draw examples to illustrate the lessons of bird protection we are so strenuously teaching to-day.

PUBLIC FISH IN PRIVATE WATERS.

OUR correspondent, X. Y. Z., who writes of the abuse of stocking private waters with fish from the public hatcheries, is entitled to consideration, because he represents a class of anglers who have substantial reason for feeling aggrieved. They have assisted in the planting of trout fry in streams which were at the time open to the public for fishing, only to see the stocked waters subsequently posted and forbidden to them. A transaction of this character savors of sharp practice on the part of the individual patriot who is the beneficiary. But human nature is so prone to get something for nothing, and the average man is so willing to enrich himself at the expense of the public treasury, that even United States Senators have been known to stock their own private fish ponds from the car of the United States Fish Commission. Such statesmen look upon the fish as a part of their "graft;" and after all, it may be said for them that there is little perceptible difference in principle between the distribution of free seeds at public expense to their constituents and the distribution of free fish to their own private ponds. The seed gifts, it is true, are sanctioned by law, and are free from the taint of swindling which attaches to the fish "graft." But is there any good reason for either?

To repeat what has been said as to the planting of public fish in private waters: The statute provides that when any waters have been stocked with State fish they may not be set aside as private parks with the special penalty for trespass. That is to say, the owner of such waters may maintain action for common law trespass damage, but may not sue for the added exemplary damages which are awarded by statute to the owners of private parks.

The statute forbids the planting of State fish in private waters. If fish are so planted, the act is in violation of law. The fish so obtained have been obtained by fraud. Presumably the remedy would be to institute a suit by the State to recover the value of the fish, on the ground that they had been obtained under false pretense. The possible recovery of this sum by the State might not be considered of great moment by the defendant, but the average citizen would shrink from the moral stigma put upon him by the accusation of fraud.

On Monday of this week the Legislature of Georgia put that State in line with the numerous others which have adopted the so-called Audubon bird bill. This is a measure prepared by the A. O. U. Committee on Bird Protection in association with the Audubon Society. It classifies certain species as game birds and certain others as vermin, and puts all others under absolute protection at all times. The general adoption of the law over the country means a new era in bird protection. The success of the movement to secure uniform legislation is due in large measure to the personal activity of Mr. Wm. Dutcher, chairman of the committee, who has for years made the cause his own.

DR. JAMES A. HENSHALL, Superintendent of the United States Fish Commission hatchery at Bozeman, Montana, reports continued and growing success in grayling propagation. The fry have been shipped in large numbers to widely separated parts of the country, and the promise is that grayling fishing will not become a lost art, but one in which, as the years go by, constantly increasing numbers of anglers may have part. Only time can reveal whether Dr. Henshall will be remembered most lovingly as the apostle of the black bass or the father of artificial grayling culture.

The Sportsman Tourist.

Tristan D' Acunha.

I HAPPENED to pick up a copy of the Philadelphia Ledger the other day, and the first article I noticed in it was one under the caption of Tristan D' Acunha, and after reading it through I sat for a while in a brown study. I had heard of this island before. This article proved to be one that had been copied from the London Times, and the Times had taken it from a British "Blue Book," a Government report.

It carried me back more than fifty years to the time when as a schoolboy I would put in hours studying the maps hunting for islands. It was then I first met with this one; then went to the book out of which I got all my information to get some about this, but got very little about it. The island seemed to be but little known then, and it is not much better known to-day. Tristan lies in the South Atlantic, about half way between the Cape of Good Hope and the coast of South America; it is in latitude 38 degrees south and longitude 12 west, as near as I can remember now.

It resembles Pitcairn Island, which I afterward found out all about in more ways than one. Both belong to England and both are really republics. They are of about the same size and the inhabitants of each are white; but here all resemblance ends. While the Pitcairn Islanders are well educated, those on Tristan have no education whatever.

I had wanted to go and see this island, but never got a chance to do it. All my exploration of islands happened to be on the other side of the globe. But I heard all about it years after I had first found it on the map. A man who had been, as he called it, marooned on it, told me about Tristan. He had been left on it in much the same way as was Selkirk on his island, though neither of them were really marooned. I had known this man many years before he was marooned. He and I were born and raised in the same ward, and were playmates when we were boys. His name was Charles Wells.

When he was 13 years old and I 15 we formed the partnership of Wells & Co., one summer and took a contract gathering paving stone. Charley named the company while I furnished the capital, a flat-bottomed scow that I built for just this purpose. It measured 15 feet over all, was 4 feet beam and had a depth of 1 foot.

We would take the scow out into the Allegheny River, when the water was low enough to work, then getting out, one of us on each side would hold on to the sides while we found the cobble stones with our feet; then loaded them on the scow, and bringing them ashore, piled them out where a team could get at them to haul them away.

Our piles were at the foot of Craig Street, and we kept them marked "Wells & Co.," so that the contractor would know whom to credit his load to, then pay us on Saturday.

They had just begun to pave the streets in our city for the first time then, and some of the first stone that was ever put down on the streets of Allegheny were furnished by Wells & Co.

We kept at work finding them from the middle of May up to the first of October; then the cold weather stopped us, and the firm of Wells & Co. was dissolved. The junior partner (taking Charley's way of placing us) quit gathering stone, then Charley kept it up the next summer, but I went West to "fight Indians."

We cleared on an average \$1 a day each, while we were at this, which was doing very well for boys; most of them when they are the age we then were cannot do as well now.

Once in a while a high river would stop us for a day or two. When it did we put in our time catching drift with a skiff that I owned. We caught some that paid us even better than the stone did; it was part of a board raft; two platforms, that had broken loose up the river somewhere. Charley and I caught it, then towing it in tied it up at our landing to hold it for salvage, and the owner afterward paid us \$15 to release it. He was an up-river lumberman, and at first, when he found that only boys had his raft, he was not going to pay us anything, he said.

I had been expecting this to happen, and was on hand with my shotgun, holding the raft, and telling Charley to go and bring the ward constable, I kept on holding it. The man changed his mind then, and calling Charley back paid me the \$15, at the same time telling me that we town boys were "too blamed smart for him"; if this had happened up at home, "I would just take my raft and pay nothing."

"Yes, sir," I told him, "We are smart enough to risk our lives saving your property, then let you cheat us out of our pay. The law gives me \$20 for your raft, I only asked you for \$15."

When the War of the Rebellion began in 1861, Charley and I both took a hand in it, and I did not see him again for 22 years, and had almost forgotten him.

In the summer of 1883 the cavalry troop I belonged to was at Fort Cummins, New Mexico, and here I found Charley again and heard all about Tristan D' Acunha. The first night after we had got a squad of new recruits, when the roll was called, I heard a man answer "here" to the name of Wells; and on questioning him I found Charley. Then we put in part of the night and all next day in each other's company giving accounts of what each of us had done in the past twenty-two years.

When Charley left the army in 1865, he went to Philadelphia, he wanted to be a sailor, and shipped there on a vessel bound for New York; here he shipped again for Boston, and next went to New Bedford, and there shipped on a whaler bound for the Pacific.

After leaving New Bedford they only met one whale north of the equator and took him. Charley began to tell me how he was taken, "You can omit that part of it," I told him, "since Wells & Co. dissolved I have taken whales myself. I know how to do it now."

He said that from the time they left home the first mate

seemed to have taken a dislike to him, and never missed a chance to run him; and the mate had struck him, and he had promptly knocked the mate down, then had been put in irons for it. Charley was very good-natured, but was quick tempered, and quite handy with his fists. The boys at home had given him the nick name of "Bruiser Wells." I was one of the few boys who never had had a fight with him, though I was as quick tempered as he was, and about as quick to fight as he. He would need to know how to use his fists if he attempted to knock down a whale ship's mate. I can think of several mates on the ship that I put my time in whom he would not knock down; but then he would not have to try it, those mates were gentlemen.

Charley appealed to the captain, but got no satisfaction from him, and was still in irons when the ship touched at Tristan. Here the captain told him that he had better leave the ship; "I am not going to put you ashore here unless you say so, but there is bad blood between you and the mate now and I must stand by my mate, so I think you had better leave us here. If you and that mate quarrel again he may shoot you."

Charley was more than willing to leave; in fact, had he not been in irons now he would have deserted, he said, and he told the captain that if he paid him off he would go. It would depend on how they made out on the voyage whether he would have anything due him or not, even if he stayed. This crew had shipped on a "lay," that is, they would be paid for their share of the oil that was taken. But the captain paid Charley some money and put him ashore, going with him himself and turning him over to the "king." Then one of the families took him in, and he remained for nine years. He need not have stayed so long though; there had been plenty of chances for him to leave sooner. Quite a number of ships called in that time, and three times during that nine years English naval vessels called and took off any who wanted to leave. But he stayed on and finally left on a merchant vessel that took him to Rio, and from there he went to New York, then left the sea and went to the regular army. He had been in it now ten years before he came to us, and I left him in it; he was in it still during the Spanish War, was wounded in Cuba, and if still alive he may be in the regular army home at Washington now; that is where I would expect to find him; he was a good soldier.

When he landed on Tristan, there were about 200 people on it, all except three being natives of the island. While he lived there he taught the children to read and write. None of the grown people could do either.

The chief calls himself the king, but he has very little authority. Every adult male is a member of his council and they make a law when they need one, then execute it themselves. They never held any kind of a church service; but he said that while he was on the island he had never heard a native use an oath. There were more women than men; and the king, when he saw that Charley meant to remain, offered to give him a wife, but Charley did not take her; he did not know how long he would stay and did not want to take one and then leave her. The king both married his subjects and buried them when they died, but the services were crude and very short, until Charley found a prayer book on the island, and after that he read the service while the king looked on.

"Why did you not appoint yourself chaplain?" I asked, "then hold church on Sunday?"

"Oh, they get along well enough without any church, and I did not want to make a burlesque out of it, I would look well acting chaplain, would I not? Besides, we never knew when Sunday came, anyhow."

The men are tall and thin, and most of them are very ordinary looking; but the women were all good looking; every family had a small farm, a flock of sheep, a few cows and hogs, and they raised plenty to eat.

Charley said that he saw some of the finest potatoes there he had ever seen anywhere. When he was there they had a plague of rats. They overran the whole island and destroyed a good deal of the crops, and it seems that they never have been got rid of since, for this late report from the island says that the rats are so bad there now that they are likely to drive what few people still remain off the island. There are only seventy-six inhabitants now, four of them being foreigners, two Italians and the other two Spanish. One of the Italians seems to have taken Charley's place; he is reported as being the only well educated man on the island now.

The children still there were reported to be fat and remarkably healthy and very well dressed.

Shipwrecked men often make this island; they are well taken care of until they get a chance to leave; some never leave. The first men to come after Charley's arrival were a mate and two men from a whaler that had been burned at sea. The mate had left his ship with seven men; five of them had died short of the island. These three men afterward left on a merchantman, the mate going before the mast along with his men. In the next six years before Charley left, no less than fourteen men made this island at different times, the high mountain on Tristan can be seen a long distance at sea, and it no doubt has helped many a man to find this island.

The island is not much larger than Pitcairn's Island, but has a chain of mountains running clear across it. This high peak is said to be 8,000 feet high, and has, on top, a lake of fresh water, which rises and falls when the tide does. Why it remains fresh, if it has a sea outlet, as it must have, has never been found out. The people were always afraid that some day this lake would break its walls and sweep them all into the sea. Charley examined it and told them that unless an earthquake broke it there was no danger of it ever hurting them. He said he thought the lake occupied the crater of an extinct volcano.

The Thrush, the English vessel that last visited them, took them supplies of books and clothes, and offered to take off all the people and land them at Cape Town, but they did not want to go and leave their stock here. They, however, sent presents to their friend in Cape Colony, those who had left and had gone there years ago, saying that if they did not then they would not get any more clothing from these people.

CABIA BLANCO.

Breaking the Chain.

I, OF course, never let the editorial page of FOREST AND STREAM escape my notice, but sometimes it cuts deep to read it; for instance, "Spring—Time to Go a Fishing," and "Vacation Time," seemed to aggravate me for the time being. So I broke away for a few days and visited the scenes of my earlier days in old Massachusetts. I landed at the seat of Hampshire county about sundown, tired and dusty. The next morning I started for the center of the town and was surprised to see the number of electric cars with the signs on them denoting that they went in all directions. I had read of all this, but to stand and see it all was different. I saw a car marked "Mt. Tom, Holyoke-Springfield." That was my car. I wanted to get around in the vicinity of Mt. Tom. I told the motorman to let me get off at a certain place, but he forgot me, and let me off about a half mile further on. It was all right, as far as I was concerned, but he looked meek.

I got off where a famous trout brook runs under the railroad tracks. It is a long culvert that carries the water under the roadbed, and I remembered the place well, although it must be thirty years since I had been in that particular spot. Phoebe used to build their nests in the culvert on the high arch, and they do yet. I heard the same familiar call of the phoebe that I heard when I was a boy; I do not think it was the same bird. I crawled and slid down the railroad bank and looked in; then I stepped from stone to stone and got inside the culvert. There I stood and thought how we used to whistle and hear the echo; so I whistled and the same sound of years ago came to my ears. Then I gave a sharp yell; it sounded just as it used to when we went to school near by, in the old red school house which was torn down long ago. Well, I stood there and felt ashamed of myself for whistling and shouting; I thought someone might have heard me and would send word to the State lunatic asylum not four miles distant that some of their charges had broken loose. I went on up the brook until I came to the location of the old sawmill; there I had to stop and do some more thinking. That was long ago when the sawmill was running, but I used to ride back and forth on the log carriage and watch the old "up and down" saw do its work that helped deprive a good part of Mt. Tom of its virgin forests. Here I used to stand and watch the trout come out from under the mill and catch flies and angleworms that we would throw in to the deep pool. There is nothing left there to tell that a sawmill ever existed in that locality. From there I moved on to the stone dam and read a sign, "No Fishing in this Pond." If I had had the tools with me I should have fished in those waters, not believing the sign was put there for me.

Up over the hill I wandered to an old farm; went to the front door and rapped, and the same genial countenance came to the door as of yore; but the absence of intent or motive on my part was withheld. I was not known; I was a stranger; and it seemed evident I would be asked what my business was, so I broke the ice. "Well, well, I should not have known you. How you have grown; I remember you when you were a boy and used to come up here tramping around with a gun over your shoulder larger than yourself." After a good handshake and a talk of events past and gone, I could see a moisture in her pleasant blue eyes. I said good-by and started on, as my collar button seemed to be growing large.

I knew my next stopping place would be the old cemetery; so I picked a few wild flowers and left them where I thought it would be appropriate.

I followed the foot of the mountain on toward the Holyoke line for nearly a mile; then made a break for the hills. Mountain pastures were here and dry as a bone now. Then I came to a small patch of woods, and the grass around these places was green and sweet. Even these small patches of timber would have been cut down if the rocks among them had not been in such evidence that the farmer was afraid to wield his ax. Why farmers do not leave more shade trees in the pastures I do not know, but that to-day the majority of trees left standing are worth more than to be cut down is the growing feeling in that part of the country. I was now on top of what we used to call the "little" mountain. I felt tired and sat down on a large boulder and had a good smoke; then went on down the other side of the little mountain. On my way down I saw a blacksnake all of six feet long run into a juniper bush. I tried to chase him out, but could not; he knew his business. I went on down to the trout brook and looked for the places where I used to catch trout; but all had changed; in some places the brook had a new course, and in others the alders and trees were cut down from the side of the brook and the banks had caved in. It was a sorry place to look for trout, but I saw a few small ones. I followed the brook for nearly half a mile and saw but few signs of life in it. But when Mt. Tom is set aside for a State forest reservation, then the brook will grow again and fishing such as it was thirty-five or forty years ago can again be had with proper protection. I am afraid a Mt. Tom reservation is a good way off. There are a few dollars in taxes every year that some people in Northampton would miss awfully.

I left the brook and started over the hills to the place where I had left the trolley cars in the morning. As I neared the board "lean to" or trolley station, I saw a woodchuck, but he saw me first, and he started for the station and got there first; but he went in on the ground floor, and just as his tail was going out of sight under the floor he whistled. I didn't. I walked around inside the station a while (it was about 4½ by 5 feet) reading autographs of people who thought they were prominent in life. As I was four miles from town I thought I would start, and the cars might overtake me. After I had walked about two miles, one did, and I jumped on and returned to town, highly satisfied with my day's tramp, which brought recollections of long ago. The chain is mended now and seems stronger than ever.

STATEN ISLAND, N. Y.

Camp-Fire Stories from Canadian Woods.

IX.—The Husking Bee and the Bear Hunt.

THE Old Homestead was situated about five miles from the site of the present city of Belleville, upon the highlands running westerly nearly across the whole township, the country gradually sloping to the south. To the south and east a view extending over farms dotted with woodlands with the blue waters of the Bay of Quinte and the high Prince Edward shore in the distance. To the southwest, in summer, rich pastures, glowing meadows, and fields of waving grain gladdened the view until the eye rested upon the hills of Northumberland away in the distant haze.

On the north of the farm a strip of woodland crowned the highest point of the ridge, and here, reclining in the shade, one enjoyed a veritable panorama. Here one's view was enlarged until the eye rested upon Presq' Isle on Lake Ontario, some twenty miles away, overlooking one of the fairest portions of the country on the one side, on the other, to the north, over hill and valley until the horizon was lined with the Oak Hill range, a ridge of highland commencing on the Niagara frontier and running around the north of Lake Ontario until lost in the Laurentian Mountains.

As late as the early fifties large tracts of woodlands and swamp were a prominent feature in these frontier townships, and game was still very plentiful. Clouds of wild pigeons settled down upon the stubble fields; black and gray squirrels with their plumed tails graced the woodlands or scampered out of cornfields. Partridges were more than abundant; acorns, beechnuts and all kinds of "shack" were plentiful, and bruin was in evidence. Hares scurried from the pathways and roadsides whenever one passed through cedar thickets. Now and then a deer could be seen in the pasture lands feeding among the cattle or gracefully bounding away. Talk about hunting! The ordinary boy with an old Indian fowling piece secured more game during a single autumn than now falls to the lot of all the sports of the township. The boys always looked forward to the time when

"The sumptuous days of autumn came,
The saddest of the year,"

for there were in prospect apple-cuts and husking bees, and a chance of shooting of mornings and evenings and on rainy days.

As all farmers grew corn, the husking bee was quite an institution. The plan was that the boys and girls, and sometimes the older ones, would pair off and baskets of equal measure placed before each. The pair that filled the larger number of baskets during the evening received a prize. Great was the strife, and sometimes the rule was every red ear a kiss, although frequently the boy failed to secure it. At ten o'clock or so all adjourned to the spacious homestead for supper, then a violin was brought and a dance finished up the evening.

The bee was usually held in the barn or large drive house. It happened, on one occasion on the old farm, while hands were busy within the building, a bear, though not an invited guest, was enjoying a little husking by himself out in the cornfield. A dog belonging to one of the parties somehow got advised of the presence of the bear in the field, and commenced growling, barking, and making himself otherwise disagreeable. Upon being let out, away he sped for the corn. The field was some distance from the farm buildings and adjoined a piece of woodland. The owner of the dog and a couple of the boys followed. The dog was famous for 'coons, and they anticipated some sport. The night was one of Egyptian darkness, but they were guided by the sound of the barking into the piece of woods. They soon located the tree which the dog was guarding. Collecting brush and sticks a fire was kindled, and in the red glow of this instead of a 'coon a large bear was discovered perched in the crotch of a giant elm. Word went to the people of the bee, and messengers sent forth to procure a rifle. The old Indian fowling piece, though good with ball at short range, could not be relied upon to put a bear out of business, and rifles were scarce in those days. The whole crowd flocked to the scene of the dog's exploit. Fires were kept up until the messengers should arrive with rifles.

The bear became annoyed at the noise and confusion below, and made up his mind to come down. Now, when a bear makes up his mind to come down, in instances like this one, he does come down very suddenly, and, without a moment's warning, down came the bear in the midst of the unsuspecting crowd. With shrieks and yells the whole party tumbled pell mell in every direction, and such a mingling of arms, legs, heads and heels was never before seen. The bear started off, passing through the frantic people, paying attention to none, bent only upon his own escape. The dog seemed to consider that he had a reputation at stake, for no sooner did the bear start off than the dog commenced a rear attack. As often as the bear wheeled to face the dog, so often did the dog spring behind and nip the hind legs at every chance. The crowd, partially recovered from their first fright, shouted to encourage the dog. The bear could not long stand the din as well as the dog's persistent attacks, and went up another tree.

The neighborhood had been scoured for a rifle, but only one messenger succeeded in obtaining one, and this, alas! was loaded with the last ball cartridge. The rifle was entrusted to the hands of the oldest and most experienced hunter. With bated breath the anxious crowd awaited, but the hunter did not disappoint their expectations; at the crack of the gun down came the bear, the bullet having entered his brain.

The scene of exultation which followed equaled an Indian orgy around the torture fire of a victim. The bear was taken home on a sled and the consensus of opinion was that he would weigh about 500 pounds.

In this neighborhood many bear hunts had taken place, both before and since, but this one afforded the most comment and the most striking story of them all.

* * * * *

In settled localities the 'coon, the skunk, and the fox, it seems, become more plentiful than in the natural wilds.

'Coons usually lurk in the shade of towering elms which surround almost every pond, and, in the hollow limbs and trunks of which they make their home. A good 'coon hunt will afford exciting sport to the average boy. The writer has very good reasons to remember his last 'coon hunt, which is, perhaps, worth relating. The 'coon, when disturbed in a cornfield, usually returns on the next and following evenings about an hour later than the ones on which they have been disturbed. The plan was to visit the various cornfields and after the hunt was over make a log heap and roast green corn by the burning logs. After hours of hard tramping and considerable excitement and with fair success, no banquet was more relished than the feed of corn roasted by the glowing log fire which rounded up almost every 'coon hunt. On this special occasion the 'coons had been often disturbed, so a late start was made for the neighboring cornfields. The tactics of the hunt were to cautiously place ourselves outside and surrounding the corn while one went in with the dog. On this occasion we reserved the field on the old farm to be the last one visited. We arrived at the place at about the darkest hour before dawn and stationed ourselves so as to intercept the 'coons on coming out. One of the party went in with the dog whose uneasiness to get away denoted the presence of game. After the dog had beaten the field for some time we heard a tussle mingled with deep growls. Four or five of us rushed in, each striving to get there first. We all made good time and arrived about together on the scene. To our amazement and disgust, instead of 'coons, the dog had tackled an old skunk and her half-grown litter of young ones, and we were right in the midst of them. With a whoop and a spring we scattered. I tripped in a pumpkin vine and landed down hill many feet away on my head and shoulders. I do not know how the other boys got out, but when we got together the five of us were in a sorry plight, and had to endure the chaffing of the rest of the party. We silently stole away to our respective homes and waited in an outbuilding until daylight and some member of the family should bring a change of clothes.

The poor old dog—a famous 'coon hunter—driven from the house, felt that his reputation was entirely gone, and for a month or more went about crestfallen, and was so disgusted that when spoken to would scarcely wag his tail.

This was my last 'coon hunt.

E. B. FRALECK.

Natural History.

Notes on Reptiles.

SOME years ago, while crossing the Blue Ridge, Va., by Ashby's Gap, in company with a relative of the famous leader of the Black Horse Cavalry, I had a singular experience in testing the hunting skill of our common blacksnake. We had just reached the foot of rather a steep ascent, where the road passed up between two high banks, when a toad slipped through the fence; on the summit of one of them, and in its hurry rolled down into the roadway. My companion suddenly caught hold on the reins of my steed and checking its advance, said: "Hold on! There's a blacksnake after that fellow." But a few seconds passed before the reptile's head was thrust between the lower fence rails, and on detecting our presence, it was immediately withdrawn. My friend dismounted, and passing the bridle reins to myself, started in pursuit of the toad, which he soon captured and carried some ten or twelve paces, when it was given its freedom. It started up the road in great haste, while my friend returned and proposed that we should retrace our steps a short distance. We did so; dismounted, secreted ourselves and kept a sharp lookout for the toad's pursuer. We had but a short time to wait, before the reptile again appeared, and after carefully reconnoitering its surroundings, apparently concluded that all danger had passed, and slowly crawled down the slope, following the toad's trail until it arrived at the spot where it had been picked up and carried for a short distance. After trailing about for a short time, it began to circle about and act precisely as a dog will do, when it loses a trail. It increased the diameter of its circles until it reached the spot where the toad had been liberated, when it started off on the direct trail, which it had followed but a short way, when it was overtaken and killed by my friend, who had hastily pursued and clubbed the life out of it. On resuming our way he told me of three other similar instances which had fallen under his notice.

While at the Zoological Gardens, Cincinnati, a fine specimen of the Gila monster was acquired by the society. Very naturally I used every expedient to prevent its escape, in having its exhibition quarters constructed. On account of its reputation of possessing potent poisonous powers, it attracted a great deal of attention; but the visitors contented themselves with examining it at a decent distance from its glass-fronted cage, and I congratulated myself on the success of my devices for its safe keeping. All went well until one Saturday afternoon, when the newsboys of the city were given free entry to the Gardens by the Board of Directors. I felt some qualms as to the result of the affair, and gave stringent orders to the entire staff of employes to be on the *qui vive* until the last visitor had left the premises. Everything seemingly passed off well, until just as the gates were being closed, when I was startled by a report that the heavy plate glass in front of the monster's den was smashed and the reptile was missing. An immediate search was made, and every portion of the reptile house and its surroundings were closely examined, without detecting any traces of the reptile. I am free to confess that I passed an uncomfortable night, nor did I experience any relief the next morning when a farther search failed to reveal any indications of the monster's presence. A short time subsequent, I was giving some directions to a blatant Irishman, who had charge of the pony track, an appendage for the amusement of the youngsters, when I was startled by the appearance of a neighbor carelessly swinging the monster by its tail. Instantly fearing a warning cry from the Hibernian, I made a cautionary

sign and sharply ordered him to bring an empty sack. He had but a few steps to make before reaching one, which was quickly passed to myself, when I held it with the mouth opened, in front of my neighbor, who nonchalantly dropped the reptile within without realizing in the slightest degree the peril he had undergone. On questioning him, he informed me that on investigating the cause of an unusual row in his hen house, he had captured the monster, and naturally concluding that it had escaped from the Gardens, he had returned it. I heartily thanked him, but was careful not to inform him of the risk he had undergone.

While living in Natal, South Africa, I endeavored to make a collection of the skins of the birds of that region, and in skinning and arranging them I was much annoyed by the flies. I made vain efforts to get rid of them, and finally gave up the task in despair. A short time subsequent, while seated in front of my shanty, enjoying an afternoon pipe, my attention was attracted by the artifices of a couple of chameleons on a neighboring shrub in trying to make a meal of my pests. The idea struck me that they might be used for my benefit, whereupon I immediately captured and placed them on a small bough, hung by a fine wire, immediately over the center of my small dissecting table, and soon experienced a decided relief from the nuisance. Whenever it happened that I did not make use of the table, half a dozen flies thrown on the leaves of the branch sufficed to keep my prisoners quiet. Little did I imagine that a far more beneficial use of the idea would soon come under my notice. On my arrival in Batavia, Java, I found almost every available place of concealment in my bed room was used by those cunning little reptiles, the geckos, for hiding places during the day, from which they would issue as soon as darkness set in, to make war on the clouds of mosquitoes and other insects which sadly interfered with sound slumber. I was very much diverted on being awakened one morning by a humming sound in the immediate proximity of my head, and when fairly aroused was pleased to discover that the noise was caused by a pair of huge dragon flies that my attendant had captured and placed under the mosquito net, so that they might prey on any intruders which might get underneath. During my stay at Buitenzorg, I managed to make pets of a couple of geckos, which came down the pillars of the porch in front of my room, regularly every evening in order to feast on the flies which I would catch and give to them. While on my journey to the interior, I found that the inhabitants protected them and used every inducement to get them to remain in their houses. During this trip I discovered a singular superstition of the natives in attributing good fortune to the ownership of a pair of doves and found a pair caged in a large majority of the houses; particularly in those of newly married couples.

While residing in Durban, Natal, I received a note one morning from the harbor master, requesting my immediate presence down at the port, as a large python had boarded and taken possession of a newly arrived barge, and the entire crew had deserted her and come ashore. Calling one of my keepers, I hurried off down to the beach, and on my arrival found quite a crowd collected. On questioning the captain, I concluded that in swimming across the harbor during the night the serpent had evidently struck the vessel's hawser, which served as a medium for climbing on board, and had been discovered in the morning coiled around the capstan while the crew were washing the decks. Mischievously the nozzle of the hose had been directed toward it when, with a loud hiss, it ascended the shrouds to the foretop, from which it projected its head in such a belligerent manner that the crew deserted the vessel and hurriedly pulled ashore. Making up my mind as to my mode of capture, I secured a large, empty wool sack, and on requesting the panic-stricken sailors to pull off and put myself and keeper on board, was met with a direct refusal. I then applied to the harbor master, who, after much solicitation, managed to persuade two of his men to man a dinghy and pull myself and keeper off to the deserted vessel. Just as we were starting, the captain requested that I would rescue a favorite terrier, which had been forgotten in their panicky flight. As we neared the vessel I could see the python, with its head hanging over the edge of the foretop, which encouraged me to follow out the plan I had conceived for its capture. My keeper and I clambered over the rail well aft, while the dinghy was pulled off a short distance, in order to give its crew a full view of our work. After a short search I managed to find a coil of small rope and a corresponding pulley. Ascending to the main top, I slung the pulley underneath, put the rope through it and passed one end down to the keeper. Descending with the other end, I fashioned a slip noose and made it fast, with about three feet of play, to the end of a pole, which I picked up on deck. Then going forward and climbing up the shrouds until I could reach the python's head with the noose at the end of the pole, I began to annoy it with successive thrusts, until by a lucky stroke I managed to get the noose over the reptile's head. Thereupon the keeper hauled taut with his end of the line, while the python coiled his tail around the lap of the foremast and foretopmast. Hastily climbing up on to the top, I quickly loosened the pole and uncoiled the python's tail, when by a speedy pull the keeper had it suspended under the main top. Hurriedly descending, I picked up the wool sack and holding it with the mouth wide open, the choking reptile was lowered into it until its head was reached, when an expeditious cut with my pocket knife severed the noose, upon which the bag was quickly closed, and its mouth firmly tied. In comparatively a short time, from the vibrations of the bag, we knew that our prisoner had recovered its wind, when the dinghy was called alongside and we and our captive were taken ashore. On landing and lifting the sack out of the boat, it was carefully shunned by the crowd, and the skipper anxiously inquired if we had seen anything of his pet, and on my answering that I had not, but that I had noticed an enlargement of the abdomen of the python, which I supposed was caused by a hearty supper, taken on the previous night, a shout of laughter went up from the assemblage, and I hurried off with my booty.

FRANK J. THOMPSON.

The Senses of Deer and Antelope.

SCOTCH LAKE, Canada, July 21.—*Editor Forest and Stream:* In July 18 issue of FOREST AND STREAM, J. P. B. has an article on the deer's scent, and mentions Mr. Carney's experience with antelope.

Now, I believe that although they seem to differ on certain animals' power of scent, that yet they are both right, and that the conditions make the difference.

On open ground, such as antelope use, the air moves freely and without obstruction, and it would be useless to try to approach them down wind, as the wind would be moving much faster than the hunter possibly could, and the scent would be carried far ahead and the game alarmed, while yet the hunter would be far away.

These conditions apply to moose and deer when you hunt on lakes or open water of any kind; but in the deep heavily timbered country where much of the moose and deer hunting is done, the conditions are entirely different. In hunting on such ground you may travel with the wind on your back if you keep moving at a good sharp walk and don't stop any, you will be ahead of your scent, as the wind moves very slow in the woods. But when you think you are getting close to game, it is all important to keep moving ahead or the scent will pass you and reach the game before you get a shot, in which case your chances are small indeed.

Then again, there are conditions when the scent will spread a considerable distance against the wind, as anyone would see who has watched game feeding when the wind was light, and the air damp, so the scent would hang low. Under such conditions a moose will scent a man easily a hundred yards distant, and I have known them to get the scent at 250 yards, and a light air from the moose to the man, but it would take several minutes for the scent to spread.

Then again, game will act different in different places. Deer that live in the settlements don't care as much for the scent as deer that live in the woods away from any scent of men. Deer that live away back in the deep woods are much more afraid of the scent than deer that see and smell men nearly every day.

The conditions in hunting amount to about this: If you are hunting on open ground where the wind has a clear sweep, by all means be careful to hunt up wind; but if you are hunting in heavy timber it makes very little difference, if you keep moving at a good smart gait. I have learned this by my own practical experience, and have proved it many times.

There is a great difference in the weather conditions about scent spreading, as any man with a keen nose can tell for himself. Some days a man can smell a camp-fire easily half a mile down wind and quite a distance up wind; while with different conditions he could not smell it more than a few yards; and just so with the game. Some days they will get your scent before you can get near them, other days they can't seem to smell you at all.

ADAM MOORE.

Where Were the Warblers.

THERESA, N. Y., July 17.—*Editor Forest and Stream:* I was bird observing many times during the month of May, and was surprised at the scarcity of the usual migration of the warblers. On the fourth and eleventh of the month I visited Delaware avenue park in Buffalo and saw only three species, the yellow, myrtle, and black-throated blue each day. The yellow warbler is a summer resident and the other two species are usually early migrants, while the bulk of the other twenty to twenty-five species generally pass through western New York between the 10th and 20th of May.

On the 15th I was out near Lockport (where in former years on the 17th and 18th I usually saw at least a dozen species), and did not see a warbler; it was an ideal afternoon for observing birds, and I was so surprised that I went again the next morning and with the same success. Up to the 25th of the month I visited the woods six times without seeing a warbler.

In the meantime I spent a day in Buffalo, and was relating my experience to a young friend who is also a close observer of birds, and I was not much surprised to learn that his experience was the same as mine, as out of 32 species that he had seen at Fort Erie in past years, he had seen only the two species myrtle and black-throated. Other parties in Buffalo reported the same to me. We had very cold dry weather all through May and into June, but I can hardly think that it could affect the migration of the warblers to such an extent.

I would like to learn the experiences of observers in other sections.

J. L. DAVISON.

Swallows and Swifts.

PITTSBURG, Pa.—*Editor Forest and Stream:* On folio 44 FOREST AND STREAM of July 18, Bristol Hill, in his "Birds on the River," asks: "I begin to doubt whether I know the regular dwelling place of either kind [swifts and swallows]. Where do these species live now? It is years since I have seen their mud houses sticking like parasites to man's larger buildings. Why did they lose such a characteristic habit of life?" I have observed the same here around Pittsburg and Allegheny. Some fifteen years ago hundreds of them could be seen skimming the surface of the Allegheny, Monongahela and Ohio rivers in search of insects the livelong day; and many a delightful hour have I passed observing the beautiful gyrations high up in the sky of the swifts, especially before a storm. They are all gone now, and all lovers of bird life miss them.

E. Hough in the same number, page 45, says of the common barn swallows: "One or two pairs put in their appearance each year and build a nest that is promptly taken by the sparrows." That may be, and I believe is, the explanation. One more sin to put before the door of the English sparrow; they have driven other native birds from our parks and woods, why not the swallows?

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Days with the Upland Plover.

WHILE lolling in one of the big rustic rockers out on my lawn last Sunday night, I caught for the first time this season, the first tinkling cry of the upland plover floating down from high in the midnight sky like a ripple of liquid music.

Of all the notes of our many game birds, none affects me so joyously as that of this deliciously little sandpiper. Not in the startled quack of the mallard, the autumn call of Bob White, the strident skeape of the jacksnipe, or even the resounding auh unk of the wild goose, is there such magic, such resistless power as in the tinkling triplet of the upland plover. It is marvelous how a sound so light can be so far reaching or a tone so ineffably sweet traverse the air for such an incredible distance and at the same time lose none of its mystic charm. I honestly believe that the rippling alarm of this queer little habitué of our big hay fields, as he leaves the close-cropped verdure and bounds into space can be heard on a favorable day, for a stretch of a mile or more. All surroundings lose their enchantment for me when I first detect that tiny film of gray trailing over the mid-summer sky and catch those pearls of sound that only one little speckled throat can drop.

But so it is with most sportsmen. Next to the quail and the little russet-colored jack, the upland plover comes first in their affections, and, in fact, during his open season, he ranks way above any feathered game.

He comes here to our broad hay and newly plowed fields from his breeding grounds just a few miles—say a hundred or so—to the north at a time in the year when all his congeners, save the almost ever present turtle dove are reveling in the more salubrious climes of the farther north, and furnishes a sport that few lovers of the hammerless care to deny themselves. And now that the alarm has been sounded in the nocturnal skies, the picturesque habiliments of the field will be hauled forth, and ardent forays made upon the big pasture, hay and plowed fields, which stretched away in oceanic undulations for countless miles in every direction west of this favored city.

The arrival of this little mottled beauty is always the signal for a renewal of activity among the gunners. From the dawning of July they are on the lookout. They know his punctuality of character and that he will be here on time, and regularly in the evening the strained hearing is turned heavenward for that plaintive sound, that apprises them that the plover are moving and that it is time to go afield. And when the old sportsman does catch its first note what a thrill it sends through, for as I asserted before, there is nothing so sweet to the hunter's ears as the whistle of the upland plover in the evenings of mid-July.

The plover's call is a melting, trickling lilt of melody, a subtle music difficult to imitate but always of sufficient force to halt a sportsman when he hears it for the first time falling through the air. And then when he crawls through the barb wire fence and plants his hobnailed foot on the short grass of the wide pasture, he is the gladder man on earth.

"Tur-wheetle! tur-wheetle! tur-wheetle!" Those are the dulcet notes, as nearly as I can reproduce them orthographically, that vibrates the dancing air when the flight is on till the tinge of carmine in the western skies deepens into the thickening veil of midnight.

The upland plover are strictly nocturnal in their migrating habits, and do all their traveling and exercising after the riant but blistering Phoebus has immersed himself behind the western horizon, and but seldom sound their sweet carrillon save when upon the wing. They will, however, on the approach of danger, emit a single, sharp, warning cry and ply their light, slender, greenish legs with remarkable velocity as they run through the straggling rag weeds and scared sun-flowers and away. When wing broken and running from the ruthless gunner, they are apt to betray their whereabouts at every fresh start by whistling once or twice, and at such times there is a touching melancholy in the birds' notes.

When I first came to Nebraska upland plover were so plentiful all over the big grazing lands of the State and so easily approached and shot down that there was but little incentive to hunt them. But there have been many sad changes in game life during the past decade, and while the uplands are never more encountered in such numbers as they were in the early days, they are by no means scarce. They are much wilder and more wary, however, and it requires the refinement on the part of the sportsman, unless he hunts in a wagon or on horseback, to get within only long range shot of them. This, however, but enhances the keen enjoyment of their pursuit. In the days of their plentifulness they were but indifferently rated for their table qualifications, but now, like the terrapin of the East, when they are not to be had for the asking, they are much sought after by our epicures and high-livers. I remember in my reportorial days in Washington when a dollar greenback would buy a cartload of terrapin, but to-day in any of the gay capital's swell cafés a single plate would cost five or six times the sum. A dozen years ago upland plover would not bring 50 cents a dozen in the Omaha market, but now, if they could be purchased at all, they would readily bring from \$3 to \$4.

Many, many rare days have I enjoyed out here with this beautiful little courser of the skies, and Wednesday last was not the least of them all, aye an oasis in the monotony of the waning days of a sportsman on the down grade. I heard the tinkling of passing birds the Sunday night previous, and on Monday and Tuesday evenings these plaintive messages from the realms above, dropped with the most thrilling frequency, and you can imagine what that meant. I had some trouble, strange as it may seem, rounding up a comrade for the case, but finally found the Barrister, an old and beloved companion of forest, field and stream, and an hour later, behind old "Molly," we were bowling along the quiet coun-

try road through God's own country beyond Benson. The day was a lovely one despite the sun's fierce rays, for a refreshing breeze came singing up from the northwest, and great masses of billowy clouds kept the earth about half the time immersed in soothing shadow, and Bill and I would have had a glorious time had we not bagged a feather.

As we rolled along I could not help living over the enchantment of all the past years on that very same errand. Year after year, when the bluegloss had spread its delicate azure across the pastures and the pink of the wild rose blended with the yellow of the moccasin and the sunflower, and the fluffy topaz of the golden rod and sensitive plant, when the air was redolent with the multi-various odors of the summer time, the newly cut wheat and oats, the tasseling corn, the heavy fragrance of the sweet clover, the blossoming thistle and speckled disc of the wild poppy; when the mutterings of the thunder came from the storm that had circled us on the north, and silvery-tipped clouds thrust their glistening peaks, like fagged crags, above the horizon—when a softer quiet lingered over our great pasture lands, and a milder radiance played along the distant sandhills—those were the days that I put in with the uplands, year after year, until it would seem that I should have had a surfeit.

Well, instead I lived them all over again on Wednesday last, and while the Barrister and I did not compass such a plethora bag as marked some of our past experiences, we did kill seventeen uplands and that was enough to make us both contented and happy. The aim of the sportsman to-day is not to outstrip the kills of ancient times. With the increasing scarcity of game he has grown to rest satisfied with the benefits of such an outing, to glory in the beauties of nature as they are revealed to him. He is ennobled and bettered by the inspiration he finds in the woods and fields and by the lakes and streams, and profits by the tidings brought to him by the winds through the cottonwoods, the songs sung by the gurgling Platte, the roaring Niobrara, intoned by the mighty voice of all outdoors.

It was 10 o'clock when we reached the big rolling pasture field on Farmer Platt's beautiful ranch. We had neither seen or heard the sign of a plover along the whole way out, but I knew if they were anywhere they would be here, for not once in the past ten or twelve years had I been disappointed on finding them there on my first visit. We had hardly hitched old Molly and passed through the big gate when we were startled by that thrilling tur-wheetle! tur-wheetle! and a single bird flushed from the dusty cattle path and sailed away against the background sky like a thread of cobweb.

"Look out, Bill," I admonished, "there is apt to be another near here—they seldom remain long alone."

We were both, of course, keenly alive to the situation. We knew the birds were there, and we were both ambitious to make the first kill of the season.

Carefully we strolled along where the folded white and purple globes of the wild morning glory twined over the deep gold of the cinquefoil, and where the iron weed's tall lavender stems, laden with dust, stood like slim sentinels in the quivering air.

Suddenly, just as we were about giving up hope of flushing another bird, we were electrified by a very chorus of shrill tur-wheetles to our left, on Bill's side, from out the hot shade of a veritable copse of ragweeds. Simeral was the first to shoot; in fact, I had no opportunity, and I was a little bit nettled to see him neatly cut down the first bird. I hadn't long to nurse my envy, however, for a bird had circled in the air, and turning, was coming back quartering on my side. He was on the down wind and I shot behind him with my first barrel, but caught him hard enough with the second to push him up several yards higher in the air. He soon began to sag, and the next moment I was overjoyed to see him start slantingly for the dusty sward with greater momentum than ever, bobbing badly from side to side, until, suddenly, with a faint thud his blood-stained and mottled body struck with a bound the short-browed grass along the cattle path. It proved to be a fine young cock in a brilliant new coat, and I was extremely proud of my first kill.

It was too hot for the birds to remain long in the air and by the time I had rejoined the Barrister, there wasn't a feather to be seen, or a sound, save the never ceasing drone of the cicade to be heard.

"What became of them?" I inquired.

"They are way off there over that plowed field—I watched several of them and saw them go down there. Let us work down to the end of this and then go over there."

This we did without jumping another bird, and then we went off and explored the upturned field over which Bill had last marked the disappearing bits of gray, but without success. We were now thirsty and panting with the heat like a couple of hard-pushed pointers, but our ardor had by no means cooled, and we slowly returned to the Platt pasture. We had almost reached the big lower gate when that well-known triplet of liquid music, which must have fallen from incalculable heights, struck our hearing, and at the same instant we saw a wisp of gray and white flitting over some low sunflowers down the fence not an hundred yards away. This was not the bird whose cry we had heard, however, he was up in the zenith somewhere.

In his impatience Simeral up and blazed away, but, of course, produced no effect at such a distance, other than to frighten three other birds out of the ragweeds near by.

With a chorus of frantic cries they took wing, and we both got down a bird, mine a hard, swift overhead shot, and Bill's a straightaway. The third bird went up into space at a rapid rate, crying out in fright as he climbed, but making no headway at leaving the vicinity. We watched him eagerly as he circled round and round above us, and was about to give him up and move on when suddenly he gave a sidewise pitch in space and came tumbling toward the earth at a rapid rate, righting himself as he got nearer, and finally alighting dudishly not a hundred paces from where we stood. Billy got it between him and the scanty line of sunflowers, and made a sneak that would have done credit to an Apache Indian, killing the plover as he stood, high and alert on his gray-pillard feet, in the very tracks where he had alighted.

We were still animadverting humorously on this bit of luck, when an old cock, silent as a thistle down, came

floating over the waving corn and undertook to pass us, skimming low down over the pasture. We both saw the bird at the same time and each determining not to be outdone, we jerked up our Parkers together and pulled the triggers. I had the exquisite pleasure of seeing the Barrister's load as it tore through the straggling ragweeds behind the old cock, and exceeding exasperation at my own, which went off through space three feet above the horrified sandpiper. We had both been too previous and both scored a miss, and then we laughed, each blaming the other, but we knew we had scared the bird half to death from the way he was beating tanbark up the aerial way. He had heard the report of our good Ideal shells and felt the wind of the whizzing shot, but that was all. His gray coat had not had a thread ruffled, and, we stood there watching him, as on the wings of his silvery song, he disappeared off toward the masses of vapor in the coloring west.

But there were plenty of birds left and we knew it, and to avoid any further provoking contretemps of this sort, we agreed to separate, and as I worked back along the edge of the corn, Bill strode off cat-a-cornered across the pasture.

We had hardly separated when two birds flushed in front of the Barrister. They were at a trifle long range, but he turned the first one over with nice skill and dusted the tops of the rag weeds around the second. He ran to retrieve his fallen bird, which proved to be wing-broken, and as it led him off through the patches of mullein, rag weed and purpling lobelia, he flushed at least a score of birds that had been lying in the thin shade out of the heat of the sun. All of these birds took to the corn, dropping down here and there and everywhere, scattering, in fact, just right to insure a big killing, and I made it, too. When I found Bill an hour later down by the old bars, I had seven plover, all full-grown birds and in fine condition.

But lack-a-day, like all of the good things of life, our sport came to as sudden a close as it had begun. The birds simply got up finally and quit the neighborhood. As we stood by the roadside and lamented, we saw once or twice a streak of drab scudding across the azure of the sky, miles away it seemed, and merge with the clouds, while now and then, coming from where we could not tell, came that mystic, far-reaching tinkle, then all was quiet, save the insects in the grass by the roadside, the call of the meadowlark and the chuck! chuck! chuck! of the crossing blackbirds overhead.

With feelings of supreme content we piled in the old phaeton, took a long pull—on our cigars—and drove home through the glimmer of the gloaming.

SANDY GRISWOLD.

A Comedy of Errors.

It does seem incredible that a man with considerable experience in hunting should have made as many mistakes in one day as did I.

But from making three great blunders, I learned three great truths: First, that a deer and a pack of hounds may go by while one slumbers, so conducive to sleep is the atmosphere of the pine woods. Second, that a deer is not necessarily dead because some one along his runway has fired a gun. Third, that a deer "tucks" his tail if hit and does not "flop" it. How I have fretted and worried over the cost of learning those three plain facts of the chase! How I have wished that I could get the chance to do it all over again! I would now have the respect of an old man, who though I may never see him again, stands out in my memory of humiliations like Mars at perihelion. But, as Artemus Ward said when the seventeen Mormon girls asked him to marry them, "It cannot was." My dear old hero, Slicker Harris, of Clark county, Arkansas: If you be yet among the living, accept this confession as the final and prayerful unloading of a burdened, penitent, and gloriously punished tenderfoot. You suspected it all then, didn't you? Ah, I knew you did; but I was younger then and youth knows nothing of the joy of honest confession. That was in 1893. Slicker, and ten years—well ten years is a long time when, as in my case, it makes the difference between raven locks and those mixed with gray. And then, you will not forget, my dear old patient and generous soul, that at the start you made too much of me because I was the tenderfoot and because, too, that I had the Spencer repeating shotgun, the like of which you had not seen, and with which, as my companions told you, I was able to do mighty things. You will not forget all that now after these years, and you will, no doubt, be better able with the aid of the perspective that time gives, to be charitable. Really you may get some enjoyment out of that day's occurrences as you view them in the added light of my confession, though at the time, and in spite of that air of credulity with which you listened to all my explanations, you must have felt like losing me in the bush. Ah, you old rascal! what a courteous son of the South you proved yourself to be!

Do you remember, of course you do, when your darkey put me upon that stand early in the morning? It was a "stand" that promised all but a certainty if a deer should be started. When your man had gone—now Mr. Harris, please do not tell anyone of this—I waited very patiently for a long time. It seems that way to me now, though I would not testify under oath that it was over half an hour, for time does go awful slow under such circumstances. I say I waited patiently for something to turn up. But nothing turned. Then I began whiling away the time in the good old fashion, having a bunch of cigars in my pocket. But, my dear sir, there is nothing so conducive to the spirit of game preservation in the heart of the tenderfoot as the utter loneliness of a vast wood. How insignificant does a deer, dead or alive, then seem to be! I soon sank into a condition in complete harmony with mother nature. Tossing my cigar away I dropped upon a seductive bed of leaves at the side of a log—do, please, never repeat this—and was soon fast asleep. So now you can understand how it was, when you and your troop of "hoss" came dashing through the wood an hour afterward, that I was telling the truth when I responded to your excited query why I did not shoot that I had seen no deer to shoot at. O, I'll never forget your look of disgust! Nor will I ever forgive myself the folly of trying to deceive you. You thought I had gone from the

stand, didn't you? You did not dream that I had committed the unpardonable offense of going to sleep at my post.

But you, grand old fellow! I learned then most emphatically that it does not take scholastic acquirements and fine clothes to make the gentleman. You seemed to take no note of my humiliation, though you must have guessed it. And while you relieved the strain by renewing your questioning interest in my repeating shotgun, you hardly guessed how great a solace to me were your assurances given in that hearty way of yours that you'd give me a fine chance before the day was over.

Then you'll remember, too, the next stand upon which you placed me? It was about a mile and a half west of the cotton gin. Ah, my dear friend, it was there that I determined to redeem myself with you. And "Slicker," I did stand for two long hours at my post hardly batting an eye, while I listened to the coming and the going of the baying of your old dog Boss, and his companions. I kept my gaze intently upon the point in the bush what wreathed that knoll about where you had told me the deer would first come in sight toward me. It would have been all right, too, if you had not shot and yelled as you were driving the deer toward me. Really, it seems to me you should have known that the shot might have the effect of misleading me. You remember that the deer astonished you by turning to the north and away from his usual course just immediately after you had shot and hallooed? Well—I'm ashamed to tell it, but here goes—the fact is that thinking you had killed the deer, I left my stand at a dead run right down through the bush toward you. The deer found it out, though you did not. The ways and customs of the game which you had learned from fifty years of hunting were all changed and broken that day, weren't they? No doubt if I had stood my ground I would have gotten a good shot at that deer. But how was I to know? You had not told me when you found him coming directly into my net that you would fire your gun that I might be notified.

I remember most vividly your disappointment mixed with something of chagrin, but you will never be able to realize how heavy was my heart. Two magnificent opportunities missed! And just to think of it! Opportunities that I had been praying for years that I might have!

I thought it was all "off" then. I fully expected you to abandon all effort to make a kill. But the day was but partly spent, and like the true, big-hearted, generous, courtly and most hospitable gentleman that you were, you were gladly giving the day to the enjoyment of our company.

I recall with a feeling not unmixed with pain, how you got off your mule and walked with me up through the woods in the direction the deer had taken, and how you chatted with me in your quaint and most entertaining way. Do you not remember telling me so proudly—and I was proud for you—of the daughter that was away at school and of the letters that she wrote back to you—letters that "only jist teched the high pints?" And do you not remember the clump of persimmon trees we came upon? Trees that grew fruit that had no seeds—great, big, luscious bites that were waiting for us in bushels? And how you chided me for trying to "overdo a good thing?"

Then how good those hard-boiled eggs tasted as we sat at the roots of those pines at lunch hour! Then the cigars as their aroma mixed with the aroma of the woods! And then you do not forget how old Boss, who had been quietly dozing just a little distance away, got up, and nosing about, opened upon a trail just at the edge of the thicket of undergrowth, that was just to the north of us? Though you may have forgotten it, I have not, for it aroused in me an enthusiasm that had died with the second mistake I had made that morning. All at once I saw visions of leaping bucks and scented again the chance of getting a shot. And, oh, to redeem myself! That I fully determined on at once. And as I started around the thicket in response to your suggestion to make "tracks" for the point that jutted out to the northwest, where you assured me excitedly that the deer would come out, I almost bit my lips and crushed my gun in my grim and most resolute determination to make up for the past if only the opportunity should come to me. What music was the baying of old Boss as he trailed around through that thicket on the wake of that buck! I knew it was a deer, for you had said so when first you heard the dog open on the trail. And what a thrill it sent through me to hear you calling, "Whoop 'em up, Boss; whoop 'em up," when finally I had reached a point of the thicket which, in my tired and worn condition, from the hurried run I had been glad to accept as the one you had had in mind when directing me. And what a picturesque sight you presented to me, as just with your head and shoulders above the bush, I saw you forcing your mule through that thicket in the effort to follow the dog! There was no danger of sleep then. Nor was I going to leave my position, no difference what allurements were offered. How excited I became and yet how eagerly determined as the bay of the dog came closer and closer. Soon he was coming right in my direction, and I could see you, not over one hundred yards from me, and the dog between us. At every moment I expected the deer to bound in sight. But he did not, and it was a puzzling query that presented itself to my mind when, at the mouth of an opening in the bush and not over fifty yards away, the dog, nose to ground, came in plain view, then turned to the northeast still trailing. Do you suppose that the deer had been at that opening, too, and had been turned by my presence and without my having seen him? It was certainly without my seeing him if, in fact, he were there, but I'm sure now that it must have been that way, else why did old reliable Boss come that way? Really, now, "Slicker," was that another opportunity missed that a practiced deer hunter would not have overlooked? Turning about just at this time my delighted eyes fell upon the deer, just as he had come out of the bush a little further up, and was cutting across my path in eager haste to the southwest. And then it was that my repeater began to talk. Ah, that was the wildest moment of my life! After every discharge of that gun I fully expected to see that buck "toss his beamed frontlet" to the ground. Do you not remember how the bark flew from the pine trees among which he ran and into which I poured

the leaden hail? You don't? Well, you were some distance away. That's true. But you were coming some, weren't you? Ah, I can see you now, old fellow, as you belabored that old mule with your hat in the effort to be in at the death, all the while shouting to me, after I had unloaded my gun, to "Run! Run! Run!" as if you had a notion that I might catch a live deer in a pine wood. And you will remember that I ran, too, just as hard as I could in the direction the deer had taken, even though he then was out of my sight in the brush, until you came up with me and yelled down into my ear that bewildering question, "Did he flop it or tuck it? Did he flop it or tuck it?" Oh, Slicker! that was an unfair advantage you took of me. Did you think I had been paying any attention to whether he had flopped it or tucked it? to say nothing of my lack of knowledge of the significance of a deer "flopping or tucking" it when determining he was wounded. Yes, I am free to admit that under the necessity to make quick answer, I did say that he "flopped it," but I will never quit believing that that deer was hard hit, and that he became the meat of wolves and that we might have had him had we followed on his trail. But after my word had gone out, how was I to admit that I did not appreciate the significance of your question? and once I had declared that he had "flopped it" how was I afterward to say that he had "tucked it?" For all that was ten years ago, and my hair was not then streaked with gray as it is now. But, ah, my dear friend, how often have I wished that he had "tucked it!"

WM. J. BECK.

COLUMBUS, Ind.

Meadowlark and Robin.

Editor Forest and Stream:

It seems that I can never get into a mild sort of controversy in your pages without danger of wearing a subject threadbare, perhaps to the wearying of your readers. Nevertheless, I feel constrained to make reply to friend Dixmont's latest remarks about the Meadowlark and Robin.

In the first place I wish to say that I am an advocate for the enforcement of all laws. If laws are not to be enforced they should be expunged from the statute books. The greatest evil that now rests upon our free and democratic country is that the principle of individual liberty is carried too far, as a result of the non-enforcement of law.

I have no quarrel with the State of Nebraska for enforcing her game law, nor with the game warden for arresting and prosecuting violators thereof.

The prime object of the article that excited Dixmont's indignation was to rebuke a preacher for holding up another preacher, in a public manner, as a moral monster because he shot some meadowlarks; and incidentally to justify preacher number two for "regretting the inconvenience he was subjected to," which was one of the offenses charged against him; and which inconvenience appeared to have been aggravated by the manner in which the game warden performed his office, in which performance he might have been less invidious and uncandid if he had been so minded.

I failed to note the statement cited by Dixmont, that the meadowlark is protected by law in Kentucky; but suspected that he is protected, as in Mississippi, as a "game bird," and not as a "song bird."

I do not know where the Rev. Craig hails from, but have learned that Mississippi was the State of his adoption a few years ago.

I wish to take issue with Dixmont in his statement that "there were many things done in his (Audubon's) day in the pursuit of game which would be considered as highly unsportsmanlike in our day." On the contrary, I believe a high standard of sportsmanship was recognized in Audubon's time.

So much for the meadowlark. Now for the robin.

I wish to impress Dixmont by reiterating the statement, that robins are not regarded as "game birds" by Southern sportsmen, any more than the Northern angler considers the oyster as a game fish. Dixmont, and I presume all Northern residents who possess a commendable degree of sentiment in their mental furnishing, has invested the robin with a sort of sentimental sacredness that makes it difficult or impossible for him, or them, to view the question under discussion except in its sentimental aspect as presented to his and their minds. But let us endeavor to take a rational view of the subject.

I believe it must be conceded as a general proposition that man is at liberty to, and in fact does, use all of the lower creatures in animated nature, in any manner that may afford him the greatest benefit or gratification in the aggregate. If in one geographical division of the world, the inhabitants, by force of circumstances, use any particular creature in the only manner that it can be made to contribute to their benefit, and in another geographical division the inhabitants utilize the same creature in a different manner, but in the only way that it can be made to serve their uses, can either one of these parties make legitimate objection to the manner in which the other party utilizes this particular creature?

If there was conflict of interests between the parties, then another question would be involved. The North might say, "The robin is our song bird." The South might, with equal right, say, "The robin is our table bird." An impartial umpire would say, "The robin belongs to the North when in the North, and belongs to the South when in the South; neither has any rights in him when he is in the other's domain; but each is at liberty to use him as occasion affords."

But it has not been suggested that there is any real conflict of interests involved. There has been no complaint so far as I am aware, that eating robins in the South has appreciably diminished the supply of songsters in the North. If that were true, then a legitimate inquiry might be raised as to the comparative rights of the two parties, each to employ its particular mode of utilizing the robin. Such inquiry might be made on a higher plane as to which mode of using the robin should appeal to the more elevated sensibilities of those using him in their respective manner.

If the issue were presented in that form, that is, that eating robins by Southerners deprived Northerners of

their favorite song bird, then I should consider that Dixmont's deprecation of shooting robins in the South would be entirely justified, and I should cheerfully vote for the preservation of the songster for Northern gardens rather than see him sacrificed on Southern tables; and this view should have added strength under those circumstances, from the prospective exhaustion of the supply of robins for both purposes.

But so long as the supply of robins appears to be ample for both Southern tables and Northern lawns, the objection to their being so utilized in the South is a bare sentimentalism, which I can appreciate and should doubtless fully share if I had been "born and bred" in the North, but being a Southerner, I cannot subscribe to it in its practical application, for which position I trust sufficient reasons have been set forth above and heretofore.

COAHOMA.

MISSISSIPPI.

Maine Guides.

BANGOR, Me., July 25.—*Editor Forest and Stream:* So long as there are reporters who merely want to fill space, and will write anything given to them on any subject by anyone, whether an authority on the subject or not, so long the world will have to endure a tremendous amount of reading that is worse than useless—it purports to instruct even while it exploits error. To a person living in the State of Maine, it is a wonder that anyone can pen such a lot of erroneous information as appears, from time to time, in the metropolitan press relative to Maine's fish and game interests.

It is such misinformation as this class of men spread abroad in the land that is responsible for many of the errors concerning Maine and its game and fish. It only needs be suggested that some fanatic "down in Maine" has thought of some change in the game laws, and straightway New York and Boston papers will tell how the friends of the measure have won their fight for better sportsmanship—or the reverse—and all sportsmen will hereafter be obliged to do thus and so. Most frequently the biennial session of the Maine Legislature is months ahead, and the "new law" is purely the thought of a very hopeful advocate of it, who may urge its passage "next year" when the solons come together.

Recently the writer's attention has been called to a remarkable yarn that is going the rounds of the press, the main features of which are to the effect that every individual who goes hunting or fishing in Maine this year must be accompanied by a registered guide, and that owing to a new union of the guides in Maine, everybody who has a guide must pay a stipulated wage of three dollars per day.

When so much effort is made, on the part of FOREST AND STREAM and every one of its contemporaries in the line of sportsmen's journals, to give in full the actual measures passed at each meeting of the legislatures of those States in which sportsmen are interested, it seems strange that sportsmen, otherwise keen business men of the world, will swallow so much error for truth.

To begin with, the Fish and Game Commissioners of Maine are limited in their powers—they may close certain waters upon petition, for a limited time; they may never open waters that have been closed by enactment of the Legislature. Neither may they change the laws affecting hunting—it is merely their privilege to suggest to the lawmakers, and of course use the right of every citizen—urge the desired law and give reasons for it. Consequently, when Maine has passed a law, it remains a law for at least two full years, unless there should arise exceptional cases calling the Legislature in special session, when there is possibility—but not probability—of change or repeal. It is many years since the Maine Legislature convened in extra session, although it will do so this year, without, however, any special reference to the general game laws enacted at the session last winter.

As a matter of fact, every non-resident sportsman coming into Maine to hunt moose or deer is expected to be under the eye of a registered guide, who—in theory—must give a report of the doings of his "parties" to the commissioners when his season's work is ended. In practice these reports can't always be verified, the guide reporting what he pleases.

The present law demands that no one guide shall guide (be in the employ of) more than five people at one time, and of course a guide looking out for five different rifles, miles apart during the hunting hours, has little means of knowing what goes on among those with whom he is not immediately engaged for the time. Before the enactment of this law, which is in the line of better sportsmanship, but not close enough to be effective, guides have been known to pose as "the guide for a party of 50" and even more.

Another feature of this amazing yarn about Maine is that the guides have formed a union organization and adopted a standard wage of three dollars per day. This is untrue, and any man who had been in Maine would see its weak side at once. With sixteen counties in the State, ten of which at least are the homes of some of the 1800 registered public guides in Maine, the home of the most westerly guide being more than two days' ride in fast express trains from the most northeasterly guide's abiding place, the geographical difficulties to a union, let alone the sectional differences, which are many, would prevent any such an organization from being effective. As a matter of fact, the average wage of a guide in Maine is "three dollars per day and found," and those who make more than a bare living out of it, with six months of idleness or work at less than a third of that money in the lumber camps, are few indeed. Some of them, rarely capable and reliable fellows, steady, honest, willing, ready to paddle forty-eight hours if need be, never in the way but always ready for the next move, skillful hunters and just as good listeners as they are talkers, some such are able to command five dollars a day; but the other man is hunting for them; they're never loafing around and looking for a party in the season, for they have a regular line of "sports" and frequently some on the waiting list. Some can be hired for almost any price.

Guides, that is good guides, have to spend years in

fitting themselves for their work, and must be prepared all the time for the most unexpected tax upon their skill and strength. Few of them are willing to go with more than one person, that is upon a trip where there is canoeing, with its carrying, cooking, etc. And while in some localities there are guides' associations, such as the Rangeley Guides' Association, the Dead River Guides' Association, the Mooshead and Jackman Guides' Associations, and perhaps others, there are so many different sections of Maine visited by sportsmen that any organization that would make a trade union of them would be absolutely impossible. A union of the guides for protection, to see that unjust and unnecessarily harsh laws are not passed for their injury, is one of the things that is bound to come in Maine, and when that day comes, then the makers of laws will have a body of counsellors at hand who will know what is right and what is wrong, what is best and what is unwise in the administration of the fish and game of this the greatest of recreation States for sportsmen.

HERBERT W. ROWE.

Game Preserves.

Editor Forest and Stream:

It was not my intention to enter into a lengthy discussion of the ethics which should obtain between the rich and the poor of this earth, but the editorial under the above heading makes it necessary for me to say something further on the subject.

First of all I wish to call attention to the fact that it was Christ, and not myself, who suggested that the rich give to the poor. Christ is infinite in wisdom and goodness, therefore the wisdom of His teachings is above human criticism, and fully warrants me in the belief which I expressed, that a general compliance with His teaching would be a sovereign remedy for most of the evils of this life.

At the same time I tried to make it perfectly clear that I believe that the natural selfishness of man always has, and always will, prevent a general compliance with Christ's teaching. My object was to clearly point out what is wrong and not to suggest a practical remedy for that wrong.

"Things are as they are," therefore a plain statement of things as they are should not be stigmatized as a railing at the rich or an unwarranted indictment of human nature.

It is true "we have to do with things as they are," but is this any reason why we should refrain from picturing things as they ought to be? On the other hand, is it not one of the best reasons why we should have an ideal to direct us in our efforts to make things better? Casting aside the true standards of right and wrong which should be our guides in this life, is very much like casting aside both chart and compass when we start to navigate an unknown sea.

Most reforms are brought about by agitation and education. The press is generally regarded as a potent educator, therefore it is plain that a newspaper discussion of a needed reform is not "to fire in the air."

There should be no difference of opinion as to where we should look for the true standards of right and wrong. Our Creator is infinite in power, wisdom and goodness, and is also the supreme and final judge of mankind. He created the universe and gave us laws for our guidance, and by these laws He will judge us. There is no escape from this judgment. I know of nothing which is more "futile" than an attempt to set aside the divine law on the ground that it is "nowhere recognized as a practical course of conduct of life," except by individuals who are regarded as cranks.

The divine law is immutable. And now, in regard to the game preserve question. Charles Hallock truly says (see FOREST AND STREAM, page 44) that in the divine plan of creation, love is the basis of intercourse between man and man, and also between man and his Maker. Our Creator has commanded us to love our neighbor as we love ourself. Let us apply this law to this game preserve question. Does a man love his neighbor as much as he loves himself when he buys 50,000 acres, or any number of acres, of forest, stream and lake, so that he may fence his neighbors out and enjoy the pleasures which he has deprived them of?

Manifestly such a person is a violator of the divine law, and his neighbors are justified by the same law in taking his possession away from him and restoring it to its normal condition.

This is both a practical and just way of dealing with "human nature as it is," and should meet the approval of those who seem to regard human law as paramount to divine law, for human law sanctions the taking of land and other property from private ownership for public necessities. Surely the opportunity for rest and recreation is a public necessity.

Would it not be a more sensible, just and safe method of procedure to thus consecrate our lakes, forests and streams to the public good then it would be to "expend effort on certain limited lines under present conditions?"

JOS. W. SHURTER.

GANSEVOORT, July 22.

Editor Forest and Stream:

I would recommend to the careful reading of the public some recent editorials in FOREST AND STREAM. They are entitled Rich and Poor, The Game Preserves, Fishing Rights and Things as They Are. The sentiment is sound, because it is built upon the foundation of truth.

It is so ridiculously easy to languidly invite others to give their all to the poor, and at the same time hang tenaciously on to your own. The preaching that is not practiced is hypocritical humbug. Railing at others whose riches are greater than one's own is but the reflection of an envious soul. Men who own game preserves also endow institutions of learning, and make it possible even for the negro to gain an education and carry off the highest graduation honors, as at Yale and Harvard this very year. Men of wealth are constantly giving freely to the unfortunate, and at no time in the history of the world has philanthropy attained to the prominence of to-day. The millions of the Carnegies, Rockefellers, Vanderbilts and Goulds, are unceasingly pouring a stream of gold into the lap of suffering mankind. Only recently, in the beautiful town of Greenwich,

Conn., have I walked over well-kept roads leading through private property, and maintained at private expense, which have been thrown open to public use and are thankfully patronized by the people. These same roads are far better than are the public ones.

The fence or trespass sign which excludes the public from private lands, is not only used by the rich, but by the poor as well. And the same law protects each equally. Much farm property is posted in these days, wild land as well as cultivated. This is sure to be more and more the case the more the land owners are antagonized by uncivil and arrogant trespassers. But the hue and cry against excluding Tom, Dick and Harry from private lands seems not to be directed at the poor land owner, but at the rich one. This seems positive proof that hate and envy of the rich is the principal incentive for these attacks. Hate and envy never did, never can, and never will travel hand in hand with reason. I am not rich, but the few acres now under my control are posted. Not for spite, mind you, but because I might as well move were the signs not there. The place would soon be completely overrun with people, who would not themselves tolerate trespassers on their own lands.

When the people in this great and free land have a legitimate grievance, they have the lawful power to adjust matters at the polls. If it antagonizes the public good when rich men acquire immense tracts of land, and turn the same into game preserves, the remedy is right at hand in the ballot. But the vast majority of our people appear content to the fact that rich men own game preserves, and this is proof enough that the agitation of a small and discontented minority carries no weight whatever. In my humble opinion, it is far better that the rich man preserve some of our woods and waters and keep them constantly stocked with wild birds, beasts and fishes than to have the land become barren of game. The greatest good to the greatest numbers is good religion. The individual who perpetuates the game is performing a great good for future generations, whether he wants to or not. A great many poor men may club together, own and control a game preserve, if the ambition prevails to do so.

As to brother sportsman Didymus, I would say: I do not believe that "all men are too saintly to gratify revenge." I never wrote or said anything to that effect. But I do now, always have, and always will believe that any individual who criminally gratifies his revenge should be heartily condemned, detested and hunted by every good citizen. And I am particularly gratified that some of the Adirondack firebugs have been apprehended, convicted and now have abundant time to reflect—behind iron bars—on the disadvantages of being a firebug.

As to Raymond S. Spears, whose writings on the whole I greatly admire, I would say that he is right in regards to the existence of firebugs in the Adirondacks. But I still believe that 90 per cent. of the fires were started in some other way than by criminals.

WILLIAM H. AVIS.

HIGWOOD, Conn.

Editor Forest and Stream:

It seems to be utterly useless to continue a fight where the point at issue is utterly ignored—it is simply fighting the wind. Two of your contributors in the last issue have wasted their time in repeating the same old arguments against what I never have denied—a man's legal right to buy up a whole county if he can; but I contend that a man who will do so is utterly selfish and unworthy of respect.

I also assert that it is foolish in policy, as it arouses bitter animosities, and the spirit of revenge that it incites is not in the interest of the owner or the preservation of the forests, as the recent incendiary fires sufficiently prove.

Now, I think I have done with this question of huge preserves and the selfishness involved, and I hope the advocates of that policy will set up no more imaginary targets to waste their ammunition on.

DIDYMUS.

Editor Forest and Stream:

The game preserve, it seems, still has the floor; it is a subject that will not down, but bobs up again every once in a while. Here in Pennsylvania about every other farmer has his land posted; does not he maintain a game preserve on a small scale when he posts up those signs, "No Trespassing Here?" We know, then, that we dare not go on his land unless we want to pay a fine for doing it. And why should he not post his land if he wants to do it? He has the law back of him when he does it, and has, to him, at least, a good excuse for doing it: he does not want to run the risk of having his crops damaged. Some of us would not damage them, others would.

The most of these farmers will, if asked, allow a man to hunt on their land. I was never but once refused that privilege when I asked for it; and that man afterwards met me in the road and withdrew his refusal when he saw me hunting on his neighbor's land. But if they do not want us there, then that settles it; we have no warrant to shoot or fish on their place out of revenge. The men who have made game preserves have only copied after the farmer, but on a larger scale.

That millennium that we read about in the Bible has not got here yet; it may come in our time, but I doubt it. When it does and the lion lies down with the lamb—outside of him, of course—then these men who have more money than they can use may distribute it to the poor; at present some of them, at least, prefer to keep it themselves. Not all of them do that, though. I have in mind two of them who seem to be doing very well by their fellows. Both of them I knew before they were millionaires; we were only barefoot boys then. One of them gives a good part of his income to build libraries and church organs; the libraries are all right, but if I were in his place I would cut out the organs and use that money to build a half million dollar school that I asked him to build in a ward that we both know something about. The other millionaire has not forgotten that ward, though; he has built a fine play ground in it for the school children, and has put up a bath house and gymnasium for them close by.

Neither of these men have, as far as I know, established any game preserves yet; but if they did I would not feel called on to get up at midnight and burn it for them.

We don't all think alike, but I would far rather see these millionaires, every one of them, put their money in game preserves, yachts, and fine houses than see them carry it all off to Europe to spend it there, and after a while get to be such cads as to become ashamed of the country they were born in, and then get naturalized in England or somewhere else.

CABIA BLANCO.

The Deadly Toy Pistol.

ERIE, Pa., July 24.—*Editor Forest and Stream:* Just before the Fourth of July a large number of our papers, the FOREST AND STREAM among them, published a warning against the use of the toy pistol. It does not seem to have done much good. Since the Fourth, I have kept a record of the deaths of boys reported to have died of lockjaw, taking only those in cities within a few hundred miles of this, and here is the record. The total is more than were reported killed in many battles of the Civil War: Detroit, Mich., 13; Pittsburg, Pa., 8; Cleveland, O., 8; Harrisburg, Pa., 4; and about twenty small towns report from one to three deaths. In this list I have taken care not to count any except boys, and none whose deaths could not be traced directly to the small pistol.

We have 60,000 people in Erie, and seem to have nearly enough boys for twice that number. The boys here did their share of shooting on the Fourth, but they all escaped death from lockjaw. We did not have a case of it. I examined a great many of their pistols, but found very few toy pistols among them, the most of them being regular revolvers from .22 up as high as .36 caliber, and most of their ammunition had been made by the U. M. C. or Winchester Companies. Those that did shoot themselves, and some of them did, escaped the lockjaw.

There is a law in this State that forbids, under a heavy fine, the sale of any kind of firearms to a boy under sixteen years of age, but no attention seems to be paid to the law by dealers. The only way to stop this annual slaughter of boys is to forbid the manufacture of these cheap, poorly finished pistols. When I was a boy, with our old muzzleloading pistols and black powder, we could mangle ourselves up on the Fourth without having the lockjaw. I always expected to have a lot of burned fingers after each Fourth of July, and generally was not disappointed. I had them.

CABIA BLANCO.

Vermont Notes.

EAST BERKSHIRE, Vt., July 23.—*Editor Forest and Stream:* The early warm and dry spring and early summer have been most favorable for a good crop of young ruffed grouse and woodcock in this part of Vermont. We have seen some coveys of young grouse that are nearly full grown.

In the early part of the season there have been some good catches of trout in this vicinity. We have spent during the past week several days trying to catch trout out of a small spring pond near here. This pond is some 20 by 30 rods in extent, and with a depth of about 20 feet. In the afternoons and evenings we would see the large trout playing around on the surface of the water, but they would not take either bait or lure. At this season there are thousands of small minnows in the pond which the trout were feeding on, though they wouldn't notice our minnow baits.

Deer are seen daily wandering about the country. In the eastern part of Bakersfield and northern part of Waterville there are some fox hounds that should be looked after, as they are very often seen running deer. In one instance they were driven away from a large buck that had been wounded by a rifle bullet. Two of these dogs are said to be owned by a couple of worthless Frenchmen—"Canucks"—and it is a pity that the commissioners cannot find men to act as wardens that have backbone enough to see that the laws are enforced. They are willing to accept the office but too timid or indifferent to arrest violators of the law. It should be one of the duties of our deputy sheriffs to enforce the game and fish laws. Then we would have a class of efficient game officers.

In Mr. Dutcher's article on the mammals of Mt. Katahdin, Me., we notice that he fails to mention the mink, pine martin, ermine or common wildcat. All of the above are to be found in that vicinity.

STANSTEAD.

Our Macaroni Powder.

THE Galveston News is authority for a good story about Gen. Miles's recent visit to that city. While inspecting Fort San Jacinto one of the men who have the ammunition magazine in charge was standing at the door of the place with two little strips of something that looked like macaroni, they being about the size and length of that Italian delicacy.

"What's that?" said Gen. Miles.

"Don't you know, general, what that is?" said the Government official.

"Don't believe I do," said the general, examining a piece of the stuff.

"That's the powder we use in that rifle there," as he pointed to one of the giant 10-inch guns fronting out over the emplacement.

Nobody laughed so heartily as the general himself at the very ridiculous idea of the head of the United States Army not knowing what powder was when he saw it.

One of the officers then said, "That stuff is put up in those boxes you see over in that corner there. When the form hit this fort and scattered our guns and ammunition all over South Texas, it became necessary for us to send out an officer to locate and recover as much of it as possible. One day, while in the discharge of his duty he came upon an old farmer up the bay somewhere who had been picking up what he could find over in his section of the State. The officer found several of these boxes stacked away in the old man's larder, and he, in the name of Uncle Sam, proceeded to seize the combustibles. The officer procured a wagon, and as he was leaving the old man's place with his capture loaded on the wagon, the old man, with some degree of satisfaction, sang out:

"Take your old macaroni. It's no good, nohow. Mary boiled some a whole day, and it tasted like mule."—Springfield Republican.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Canoe and Camp Life Along the Delaware River.

XVIII.—Some Mention of its Aboriginal and Early Indian Life, Language and Legend.

"Stone man, stone man,
How many years have flown, man,
Since you left upon the face
Of your arrowheads, the trace
Of your skill, your needs and fears.
Loves and battles, work and tears?"
The answer sleeps within the lock
On these implements of rock.

—Magyar Ballad.

And here the Lenape warrior came,
His voice toned soft and low,
The joy of health in his stalwart frame,
To lay his arrows and bow
At the feet of the Minisink maiden good,
In token of fealty true
To the fairest maiden of all the wood,
Whom he humbled himself to sue.

—Pocono Rhymer.

THE tent is shipped back to the city; the canoe is stored. This good-by to the stream is being written in a room of a hotel at Delaware Water Gap, from notes gathered a year ago. We are uneasy in stiff, white collars and shirts, tight shoes and "store clothes." Our sun-blackened faces are shaved; the comb has actually subdued into something like neatness, the gray shocks beneath stiff straw hats. We have retired from the actual camp life where men can best study nature, that "struggle between Darkness and Light, between Mystery and Reality."

Of course no observant angler can watch and study the Delaware Valley and river without wishing to know something of their aboriginal and Indian life and legend, prior to the times of Colonial and savage history which are covered by well-known books. But the "traditions" that are current in some of the Delaware villages are evasive, traceable to no authentic source, and are, presumptively, worthless—mere poetical and imaginative creations. He who studies aboriginal life along the Delaware must go to the libraries—such sources of information as books in the rooms of the American Philosophical Society, and the Pennsylvania, New York, Long Island and New Jersey Historical Societies, and especially the Indian grammars, spelling books, dictionaries and manuscripts owned by the Moravian Society of Bethlehem, Pa.

He will be appalled at the scope and volume of these books—hundreds of them—and by their incomplete, fragmentary, unauthentic and jumbled "facts." Any student

Both made them in the "quarry" at Gaddis' Run, below Easton. Hundreds of "turtlebacks," or partly fashioned and rejected stones, were found there, together with the hammer-stones which they used, and with side depressions or "pits" worn in them where they were grasped by the thumb and forefingers of the stone "chippers." In the quarry at Lower Black's Eddy, the extensive tool stone quarry had finished implements and "turtlebacks" in layers of soil in such shape as also to show the quarry was worked by the Indians, and by men who lived many thousands of years before them. Those old men were the real pioneers, and no futile attempt will be made here to speak of their history, for no real history of them is known.*

There is so much of uncertainty and surmise in the books about early Indian life in the Delaware Valley, that I hesitate to write of it at all. Entire publications are devoted to such trivial, conjectural subjects as the significance of the kinds, styles and manner of wearing feathers and scalp locks. There is endless fiction called "tradition." Many of these fabrications have been exploded by Brinton's admirable work, "Myths of the New World."

Take the very river, whose mouth was discovered by Hudson in 1609. Its lower, central and upper reaches had different names. So had the Indians, although all were Delawares. So had each branch of the Confederated Tribes, called the Lenape Wihittuck. The Unalachtigo sub-tribe (turkey totem) lived in the region between Philadelphia and Wilmington; the Assanlicans lived around Trenton; the Unami sub-tribe (meaning down stream) lived between Manunka Chunk and Trenton, and the Minsi (wolf totem) lived from the Water Gap to the creeks forming the upper Delaware waters in the Catskills.

They had pictorial symbols, but no written language, their messages being by word of mouth; and messages between tribes were accompanied by a belt, knife, skin, or stone implement as a badge of verity. The sounds of their words are mainly preserved in an anonymous list of seven thousand words, a manuscript in the library of the Moravian Society at Bethlehem, but published by Brinton, and in the Campanius, Zeisberger and Whipple vocabularies, which were made at widely varying periods. Whipple, in 1855, wrote down many of their words in English as they sounded to him when pronounced by more or less educated Indians. Zeisberger, a Moravian missionary, wrote sounds of words in German as pronounced to him by other Indians in 1778. Campanius did the same thing in Swedish in 1645. Now, note from the following four examples how the same words differ in these vocabularies:

Swedish.	German.	English.
Campanius, 1645.	Zeisberger, 1778.	Whipple, 1855.
Water..... bij	mbi	bik
Foot..... zift	sit	zit
Eight..... haas	chasch	hasch
Ten..... thaeren	tellen	telen

And here are a few words, selected almost at random, from the anonymous Moravian dictionary. I shall demonstrate later that these and other words coincide greatly with the words in the Walum Olum or Red Score, as given in Brinton's magnificent "Lenape and their Legends," and with the old Epic Song of the Shuwan

LOOKING UP THE DELAWARE FROM MANUNKA.

who wants a headache and bewilderment, can verify this from either volume of Fiske's "Discovery of America." Let him examine the great collection of stone implements from the Delaware Valley, in the Peabody Museum at Cambridge, Mass., and wonder how many thousands of years ago, mystic, vanished hands fashioned with hammer stones, those stone chisels, hatchets, axes, amulets, pipes, adzes, mortars and pestles, spears, harpoons, knives, javelins, scrapers, lanceheads, arrowheads, needles, fish-hooks, hoes and beads. Manifestly, human hands made them; but no message comes from their owners except these almost imperishable ones wrought upon stone! They are "lights that burn, clear and holy, from out of the dead Night of the Past; they who are gone are still here; though hidden, they are revealed; though dead, they yet speak. The lamp-lit pathway sheds its feeble and feeble light, into the boundless, dark Oblivion." Silent, eloquent records wrought upon flint, argillite, jasper, agate and gneiss! It is one little index of early humanity's lost story.

From Mercer's "Antiquity of Man," and Abbott's "Stone Age in New Jersey," we learn that these implements have been found in strata one above the other, that are separated by many thousands of years in formation, proving that these stone tools were made by prehistoric men, as well as by "modern" Indians along the Delaware.

people that preceded the Delawares. These internal proofs of mutual genuineness are very gratifying.

Lenape words from the Moravian anonymous manuscript dictionary, published by Brinton:

Trout,	Maschilamek.
Canoe,	Amochol.
Chieftain,	Sakimanep.
Fish hook,	Aman.
Outlet of river,	Lakunk.
Tears,	Suppinquall.
Shallow water,	Tattheuppecat

*In due course the writer will publish a voluminous manuscript, dating from about 1520, about the successors of the old Stone Age men in the Delaware Valley and New Jersey, giving over four hundred of their pictorial symbols, and nearly two thousand of their words and their English equivalents, together with several of their songs and their musical notes, besides some account of their deities, and religious and marriage rites. These people, the Shuwans, were the ancestors of the Shawans, "Indians" that came from what is North Carolina, and settled along the Susquehanna River in the last half of the Seventeenth Century. The Shuwans were comparatively civilized, worshipped fire, and many traces of their language can be found in the Algonquin tongue, a patois of which was spoken by the Delaware (Lenape) Indians. The Shuwan people came from Labrador by way of Behring Strait, and probably derived their name from a chief medicine man called Shaman. These medicine men will be described in the report of the Siberian Expedition sent out by the American Museum of Natural History, and which has returned, bringing over thirty thousand exhibits in connection with ancient aboriginal life in northeastern Asia.

Deep, dead water,
Strong current rift,
Wind,
West Wind,
Clear sky,
Clear, pure water,
I,
Love,
Tent,
Great Spirit,
River,
You,
To paddle,
Light,
Woman,

Pulpecat.
K'schupehellen.
K'schaccon.
Wundchenneunk.
Packenum.
K'schiechpecat.
Ni.
Ahoaltowagan.
Hempiganawan.
Getanittowit.
Kittan.
Kiluwa.
Tschimhammen.
Woachejik.
Ochqueu.

Of course these are phonetic horrors. Two of the longest Delaware words, evidently made prolix by reason of the importance of the states they name, were:

Sickness, Winamallsachtowagan.
Marriage, Witachpungkewiwuladtpoagan.

Other words meant a condition, as:

Achgieuchsu, He is drunk.
N'dappintotamanuschasqucen, I am come from striking fish with a spear.

It is horrible pedantry to reproduce such jargon, especially as it is the pronunciation by unlettered Indians, and recorded by an unknown scribe merely by sound. But if the reader has any sense of humor, he can hardly fail to imagine the Delawares in council, gay in feathers, terse of speech, smeared with war-paint, and mouthing these

were divided by a river, nine parts of ten passing over the river, and one part remaining behind. They knew not for certain how they came to this continent; but account thus for their first coming into these parts which are now settled: That a king of their nation where they formerly lived far to the west, left his kingdom to his two sons; that the one son, making war upon the other, the latter thereupon determined to depart and seek some new habitation; that accordingly he "sat out," accompanied by a number of his people, and that after wandering to and fro for the space of forty years, they at length came to the Delaware River, where they settled, 370 years before. The way he said they kept an account of this was by placing a bead of black wampum every year on a belt they kept for that purpose.

Now, note the corroboration in the Walum Olum, or Red Score, as given in Brinton's "Lenape and their Legends." It recites the time when they saw that valley. "A great land and a wide land was the east land, a land without snakes, a rich land, a pleasant land." And "Opossum Like was chief; he had fought in sadness, and said: 'Let us go together to the east, to the sunrise.' They separated at Fish River; the lazy ones remained behind."

This migration to the Delaware Valley is followed by the names of eleven chiefs that succeeded each other up to the time of the coming of the whites (Hudson,

Here was as delicious a piece of comic opera as was ever dreamed of by Offenbach or Sullivan. It was about 1720. Five years later, in 1725, the Delawares refused to join the Iroquois in an attack on the white settlements, and were reproached for being "women." In 1735 they were cheated out of much of their lands, through the historic "Long Walk," and refused to surrender territory acquired by that fraud. George Thomas, then Governor of the Province of Pennsylvania, conspired with the Iroquois to evict the Delawares. All the chiefs assembled in Philadelphia for a council, and the great Iroquois chief, Canassatego, addressed the Delawares in these words:

"We made women of you; you know you are women, and can no more sell land than women." And he seized the Lenape head chieftain by his long hair and pushed him out of the council room.

The lands were vacated—all situated in Pennsylvania. Those lands east of the river the Iroquois "had no voice over."

In 1756 Sir William Johnson formally "took off the petticoat" from the Lenape, and "handed them the war-belt." In 1778 the Lenape chief Kokuethagachton, or "White Eyes," was told by the Senecas (Fort Pitt Council) that the petticoats were yet on his people. He denied it, and sent a war party against the Senecas the next year. And in 1794 the Delawares compelled the Iroquois to officially declare (Treaty of Greenville) that the Lenape were no longer women, but men.

* * * * *

It is difficult not to speak of how hallowed in memory the Delaware River has become to sportsmen who have long watched, studied and loved it. But very likely much more has already been written here than can serve as a stimulus to visit its valley. In conclusion, here's a health to all true sportsmen! They are out upon a thousand hills, storing up courage, finding new energy and hope along the banks of myriads of lakes and streams, and are wandering, happy and free, through many a wood and meadow. More and more they realize the vital truth in the familiar saying: "God made the country; man made the town." And that nation which would be more noble and free should not only encourage sport, but "should endeavor to maintain as large a number of persons as possible by rural and maritime labor."

The river will be visited again next summer. Meanwhile, here are the prized collections of pressed wild flowers and water algæ, and photographs of marvelous, many-colored scenes in that valley. As the spiral sea-shell whispers of its mother ocean, the charm of the pictures brings back their realities, and bathes them in the moonlight of fond remembrance; and we again look at them with the vision of recollection—fair, full of grace and loveliness, perennial in vital beauty.

L. F. BROWN.

Freacks from the Ocean.

Some Queer Fish in the Castle Garden Aquarium.

NEW YORKERS do not realize that the aquarium in the old Castle Garden is already the greatest of its kind in the world, although it was not established until 1896. The old aquarium at Naples, Italy, and those at Brighton and Plymouth, Berlin, Hamburg, Amsterdam and Paris are all smaller than the one in New York, and their purpose is more for biological study than as places for free popular entertainment.

No other aquarium owns such a cosmopolitan collection of fish as that of New York. More than 2,000 specimens, representing over 200 different species, give a faint idea of the vast and varied life of the sea, of which, relatively, we know so little. From the Gulf of St. Lawrence to the Gulf of Mexico and the West Indies, from the Great Lakes to the Mississippi, all waters have been laid under contribution, and collectors are constantly searching for new and interesting varieties.

On the seaward side of the building are found the tropical fishes whose marvelously rich coloring and odd shapes attract the wondering gaze of every one. In their native waters their colors and shapes harmonize with the surroundings. Under the clear waters of Bermuda the sun shines down upon mystic gardens of the sea. There grow the purple sea ferns and the yellow sea rods, variegated here and there by masses of green and scarlet sea weeds.

In the midst of this feast of color these tropical beauties have their home and are a part of this fairy land. Besides the novelty of form and brilliancy of coloring, another feature, that of rapid and wide change of color, adds to the charm. Stand in front of the groupers a few moments and study one individual. He will probably change from a plain even tempered gray to bands of black and white; the blue parrots make similar changes, and the yellowtails change so completely and so suddenly as to look like totally different fishes.

The angel fishes are perhaps the most noticeable. An angel fish ought to be angelic, but the leading one in the Aquarium down at the Battery is quite the reverse. He is a vicious creature, who has killed two wives. He is an innocent seeming sinner and beautiful withal. He is blue and gold, amber, olive and silver; but it is chiefly the tones of his blues that are the admiration of all who see him.

There are eight or ten better tempered but plain looking cousins of his who live and let live in one of the big wall tanks down stairs. But this gay-colored wife-killer has a watery mansion all to himself in the gallery, because nobody can exist with him. His calm, slant eyes betray none of his temper, but one who knows him well says that it was pure ugliness that made him pitch into the two succeeding partners of his sorrows; he never had any joys. He would cut at the poor things with his fins, and, once badly hurt, a fish can't get well. There is no ministering to a wound in a fish. There is no plaster for the stab of an angel fish. This one has been in his present quarters for several years, and they wish to see how long they can keep him. If they put him with the big lady fish, who are just as belligerent and masterful and eager to be boss as he, it might go hard with him.

Probably the angel fish has a secret woe, which might explain his irritation. No doubt he is mad with homesickness for Bermuda. Month after month and year after year he lives beneath a dull gray roof in clean enough water, for the housekeeping at the Aquarium under the

DELAWARE RIVER—HILLS AND FOLIAGE.

jaw-crackers. Think of the absurdity as a solemn Delaware "brave," smitten by the charms of his dusky sweetheart, and swayed by that feeling that speaks all languages, says to her: "Ni ahoaltowagan kiluwa," or "I love you!" Or suppose he told her he was lovesick and wanted to marry her. Glance at the words given above for sickness and marriage, and imagine the result!

Take a single example of the corruption and change in their language. They called William Penn "Onas." They were shown a quill pen, and told that was the name of Penn. Their word for pen, or tail-feather, was wonach, which they corrupted into onas.

No local village "legend," and no colonial history are given here; one is unreliable, the second is well known. They did not know of a devil until the whites came.

Their idol was a human head, cut small in wood, to carry on the person, or life-size, mounted or carved on a post. It was called wsinkhoalican. These idols have also been found carved in stone.

They had dream interpreters, or powwows, who had the power of dreaming truthfully as to both past and future, especially when they offered sacrifices, which were supposed to be carried away by a large serpent. Their soothsayers made drawings on skins of deers, showing the journey of the soul along the pathway to heaven, and symbols of the twelve emetics and purges that would cleanse of sin. Two of these prophets were found by Zeisberger, and were called in their tribes Papunhank and Wangomen. Their fire festivals, dances, marriage and death rites, and ordeals for bravery and power to bear torture, are also described by Zeisberger.

Among their chiefs named in the Red Score, published by Brinton, were White Crab, Cranberry Eater, Watcher, North Walker, Slow Gatherer, Over There, Saluted, Man Who Fails, and Coming as a Friend.

They believed that all things came from a tortoise. It brought forth the world. From the middle of its back had sprung a tree upon whose branches men had grown. Their principal god was Kickeron, the original of all, who not only produced or made all things, but produces every day. The word "kik" meant light, life, action, energy.

And they thought that the whole earth and its waters were supported by a huge turtle, whose movements caused earthquakes. Their medicine men, who professed to have personal relations with this turtle, made their medicine-rattle of a turtle shell; and when they died a like shell was suspended from their grave-posts.

The date of their entry and occupation of the Delaware Valley was about 1387. This corresponds with the statements of the Shuwan manuscript. They came from the west, found the Mengwe (Iroquois), and both tribes joined to expel the Alligewi (Shuwan). In 1767 Rev. Charles Beatty was told in an Ohio Indian settlement by a white man who had been their captive, that certain old Delaware chieftains stated to him that, of old, their people

1609). Allowing say twenty years as the average reign of a chieftain, would carry the date of the arrival of the Delawares 220 years back from 1609, or 1389. The bead record makes the date of the Delaware invasion 1387.

Each family lived in a wattled hut, with rounded top, thatched with mats made of stalks of sweet-flag or Indian corn. These huts were built in groups inside palisades, and often with a natural mound or hill in the center, where a lookout was maintained in times of danger to the village. They made pots, and used vegetable dyes and paints.

Nothing can be better verified than that the Iroquois Indians outwitted, fought and decimated them, and helped to deprive them of their lands. By cunning and intrigue they succeeded in having many of the best Delaware young men don the skirts of women and call themselves women. The tribe was widely known as the ochqueu (woman) for seventy-five years. Here is the account given by Loskiel, Heckewelder and Zeisberger:

The Iroquois sent messengers to the Delawares, with belts of wampum, and the following speech:

"It is not well that all nations should be at war, for that will finally bring about the destruction of the Indians. We have thought of a means to prevent this before it is too late. Let one nation be the woman. We will place her in the middle, and the war nations shall be the man, and dwell around the woman. No one shall harm the woman, and if one does, we shall speak to him and say, 'Why strikest thou the woman?' Then all the men shall attack him who has struck the woman. The woman shall not go to war, but shall do her best to keep the peace. When the men around her fight one another, and the strife waxed hot, the woman shall have the power to say: 'Ye men, what do ye that ye thus strike one another? Remember your wives and children must perish if ye do not cease. Will ye perish from the face of the earth?' Then the men shall listen to the woman, and obey her."

This was a wily message worthy of the present Muscovite diplomatists who are resolved to secure China for Russia alone.

The Delawares accepted. The Iroquois "made a great feast," and invited the Delawares. There they declared the Delawares to be women, and that the Delaware Indian Nation was a woman. They assembled their chiefs and best warriors, and made this speech to them:

"We place upon you the long gown of a woman, and adorn you with earrings. We hang on your arm a calabash of oil and medicine. With the oil you shall cleanse the ears of other nations, that they listen to good and not to evil. The medicine you shall use for those nations who have been foolish, that they may return to their senses and turn their hearts to peace. We give herewith, unto your hands, a corn-pestle and a hoe."

direction of Mr. Charles H. Townsend is perfect, but still not Bermuda water, so clear that he could see his father's bones "full fathom five" among the coral. Never does time or tide sweep great golden sheets of dancing gulf weed past him now, borne down from the northwest on the pure strong wind. Never does he see blooming oleanders dip above his swimming hole, or hear the song of the cardinal bird as it perches on a lily plant. Nor ever, as all the dreary days go by, does he meet and pass with pride in his own unrivalled color a fleet of gay Portuguese men-of-war.

There are many other Bermuda fishes in other wall tanks, upstairs and down. The squirrels in bright scarlet livery and with huge eyes, contrast strangely with the angels. Nature has given the squirrel fish a safeguard of his life in the way of sharp spines and a coat of rough scales which detract greatly from his palatable value in the eyes of his watery enemies. The hinds hug the bottom and well repay a few moments' study, for they change colors at frequent intervals, as do the wide-mouthed groupers. The parrots are as gaudy as their namesakes, and as varied in their colors and ornamentation. The two green parrots in the collection are larger than the parrot fish commonly seen in captivity, and they are remarkably fine specimens and of great beauty. Women particularly are pleased with the parrot fishes, and they say of their color "What a beautiful shade of green!"

The parrot fish is a deep-bodied and pretty substantially built fish, but is of very graceful and symmetrical outlines and a good swimmer. It moves often with a dancing motion in the water, but in the case of the parrot fishes this motion is not so abrupt as it is with some others which have the same kind of movement. The parrot fishes' motion is less like a dancing movement and more like a slight and gentle bounding, or more still, as though it were the result of sheer buoyancy in the water. There seems to be a touch of reserved good humor about the parrot fish's mouth; and, take it altogether, the parrot fish is a creation very agreeable to see.

It may be observed that the rocks in the parrot fishes' tank are all more or less scratched about the edges; these scratches are marks made by the parrot fishes' teeth. The parrot fish's mouth is small as compared with the size of its body, but it has strong jaws and good teeth. In nature it eats various kinds of crustaceans, which it takes wherever it may find them; if they are attached to a rock it bites them off, very likely scratching the rock where it bites. The blackfish would do the same thing, biting off barnacles, for instance, from a rock. The parrot fishes, in their native waters, had been accustomed to roaming about the coral rocks, biting off anything clinging to them that might strike their fancy. Here, impelled by habit, and perhaps finding on them some minute growths that they liked, the parrot fishes, upon their arrival and before they had become accustomed to the food provided for them, attacked the rocks in their tank and bit at them until they had them scarred all around the edges; now they bite at them less.

Among the things fed to the parrot fishes are soft clams of small size which are fed to them entire, shells and all; the parrot fishes like them. Some fishes that eat crustaceans crack the shells and eat the meat or the juices therefrom and reject the shells. The green parrot fishes, on the contrary, eat these clams shells and all, grinding the shells up with their teeth so fine that they can swallow them without discomfort.

The queer trigger fish is in many respects far and away the handsomest of the tropical fishes. It is a strong, vigorous fish, flat-sided and deep from above downward, with almost all the colors of the rainbow on its body, and over these black lines suggestive of a huge bridge on his head. All the fins have long velvet-black streamers that fly like pennons as he swiftly swims about the tank. These fish are very rare in Bermuda, and for three seasons the fishermen kept a faithful lookout for them before bringing one in. The trigger fish has big, staring blue eyes that roll incessantly. It has an apparently foolish habit of keeping its mouth open and poking out its tongue.

The doctors are shaped like a melon seed, and have a curious lance-like weapon on each side of the tail, whence they derive their name. Rock fish are mottled, and are as near as possible in color to the rocks. At times it is difficult to distinguish between rock and fish. The sergeant major wears his chevrons with the greatest dignity, but they are of such a character as to suggest the thought that he might have been to Sing Sing and forgotten to remove his prison garb. The moonfish look as if they might have been cut with a penknife from a piece of Luna herself, and little black beads added for eyes. These fish are very thin, except at the crown of the head, which is four or five times the thickness of their bodies. It is impossible to tell why they protrude their lips and pout in the absurd manner they do.

Like many another fish the moonfish has many names. One of these is dollarfish, because at one period in its growth it is of just about the size and shape and general dimensions of a silver dollar, and brighter than the brightest silver dollar ever made. It is also called monkey-fish, because of the resemblance of the front line of its head to the profile of a monkey. Other names of this sort that it bears are horsehead and headfish. It is also called lookdown, because it has the appearance of always looking down. Another name is ghostfish, because of its white figure and quick gliding through the water, not flatwise, but on edge.

In one of the tanks in the center of the building is a large sturgeon eight feet long. "Fish may have no moral laws, but they certainly show their respect for others which govern their society by invariably choosing the right," so said Curator Spencer at the Aquarium not long since. When questioned as to his meaning, he explained that it was a well-known fact that all large fish in captivity when swimming around a tank have never in one instance been seen to make a complete circuit from left to right, while they swim for hours from right to left. The large sturgeon, though not a beautiful fish by any means, is one of the most fascinating to watch, on account of the half rotary movement of the body, together with the regular, graceful swing around and around the tank.

Beautiful and dainty in contrast is the little butterfly-fish. It is apparently translucent, with all the delicate colorings of an opal, except the two dark spots near the tail and the little bead-like eyes. This fish, which is al-

ways small, has a decidedly demure expression. Its markings are so like its namesake as to at once suggest the name. They are, however, sometimes called "four-eyes," on account of the eye-like ornament on either side near the tail. It looks enough like an eye to be one, and deceives many persons. In Bermuda waters they flit in and out among the caverns and nooks of the reefs, and probably owe their lives to their disguise, for a fish always seizes his prey by the head; in this case it would be by the tail, which allows the little fellow a chance to dart away.

Fish and Fishing.

A Fish that Makes Fun of the Angler.

THE Rev. Father LeMoine, one of the Oblat Fathers engaged in missionary work among the Montagnais Indians who roam the vast extent of territory lying between Lake St. John and Hudson's Bay, has lately published a dictionary and grammar of the Montagnais language, which will doubtless prove of very great interest, not only to agents of the Hudson's Bay Company and all others having commercial dealings with these poor people, but also to those sportsmen who are in the habit of employing them as guides. Had this work appeared before I had prepared the monograph on "The Philology of the Ouananiche" for the Royal Society of Canada, or the more voluminous work on "The Ouananiche and its Canadian Environment," I might have added another to the list of many ingenious derivatives attributed to the name of Canada's sportive fresh water salmon. Father LeMoine is by no means positive as to the origin of the name, but says that it is very probably derived from the verb *unatashin-iu*—I make fun. This derivation is very much more far-fetched than many of the others which have been suggested from time to time, but it may at least claim the merit of fairly depicting one of the leading characteristics of the fish. No other sporting fish better fulfills the condition of making fun both for and of the angler than does the ouananiche. While none affords him better sport, there is certainly none that is more elusive when hooked or more uncertain as to the nature and result of its fight. An illustration of this fact was recently afforded to a friend of mine who was fishing from a canoe in the Grand Discharge. He had hooked and was playing a ouananiche of about two pounds in weight, when, to the surprise of both the angler and a friend who was fishing quite near him in another canoe, his fish leaped straight into the latter. The fisherman had barely time to congratulate himself upon the safety of his fish, and those in the other boat had not time enough to recover from their astonishment and to kill the fish, before it made another leap, this time safely reaching the water and carrying away with him the fly upon which he had been hooked, together with a portion of the casting line. The leaps of this fish closely resemble those of its near congener, the larger salmonoid—*Salar*, The Leaper. Mr. Noah Palmer, of New York, was fishing the Washeshoo a few days ago, when a salmon that was not hooked at all leaped into his canoe and out of it again.

A Marvelous Salmon Score.

The mention of Mr. Palmer reminds me of a memorandum of his recent catch on the Washeshoo, which was shown me the other day on board the King Edward, returning from the north shore of the gulf. It is certainly one of the most remarkable scores reported from any Canadian rivers in recent years. The Washeshoo flows into the Gulf of St. Lawrence five hundred miles below Quebec, and was formerly the property of the late Hon. J. J. C. Abbott, who purchased it outright from the proprietors of the Mingan seigniory. In twenty-four days' fishing, Mr. Palmer killed 182 salmon, several of them being over twenty pounds each, and their average weight being nine pounds. The first killed by him weighed sixteen pounds. His best day's sport gave him twenty fish, and when he left the river a few days ago it was still so full of rising fish, despite the late period of the season, that he killed ten during his last day on the river. Had it not been that he was considerably handicapped by a disappointment in the quality of a portion of his tackle, Mr. Palmer states that he could easily have killed 250 fish to his own rod. The fishing commences at the sea and continues for nearly four miles up the river, which is wide and clear, running through a rocky gorge, and being absolutely without mud throughout its entire course. Mr. Palmer tells me that he cannot imagine any condition of the water in the Washeshoo in which it would not be possible to kill salmon during the season. Owing to the rapid currents and the frequent waterfalls in the river, its fish are exceptionally gamy. Below the falls they lie in such abundance that they might be thrown out of the water with a pitchfork. Above them they usually take the fly almost as soon as it is presented to them. Mr. Palmer cut short his fishing because he had run short of salt and would not kill any more fish than either his men or himself could make use of. It can readily be imagined from the score above given that his guides will not be likely to run short of salmon during the coming winter.

Enormous Tuna in Nova Scotia Waters.

From a correspondent in Halifax, writing on the 24th of July, I learn that enormous tuna have struck into Mira Bay, Cape Breton, in big schools, and that many sportsmen are hurrying to the scene. The writer of the letter states that on the twenty-third, two Glace Bay men who went out in a tug, hooked a fish seven feet long, but the monster broke away. The Nova Scotians never know the fish as tuna, but call it horse mackerel or albacore. Several specimens have lately made their appearance in Gaspé Basin.

Ontario's Angling Attractions.

There is a good prospect that the government of the Province of Ontario may shortly take a leaf out of Quebec's book and offer for sale the lease of some of its many magnificent angling waters. Such, in fact, is the conclusion to be drawn from a statement recently made in the Legislature of that Province by Hon. F. R. Latchford, Minister of Fisheries. Referring to his own lease of a lake in the Province of Quebec, he expressed a general

approval of the Quebec policy in regard to the northern lakes, and suggested the possibility of complete surveys and explorations by experts, with full reports as to game fishing, scenery and other attractions, to the end that many remote lakes might be leased by public tender to wealthy anglers. In Quebec there are many complaints that this system of leasing has been overdone, and that local anglers are virtually deprived of sport in all the more accessible waters. But, on the other hand, it is altogether likely that without the excellent protection which these leases have given to their waters they would long ago have been depleted of fish, as many of those in Ontario have already been. Men without sense and incapable of feeling shame have murdered fish by the thousands in small lakes. The pirate, with his net, has scooped them up, little and big, in and out of season. Groups of men have stumbled on little lakes, fairly teeming with black bass, and have glutted their passion for fishing, leaving the slain in heaps on the rocks. Now the chief danger which seems to threaten the beautiful waters of Ontario is the lease of their fishing for commercial purposes. That of Lake Manitou, Lake Nepigon, and other lakes has already been leased to commercial fishing companies, and it is this circumstance which led up to the recent angling debate in the Legislature, in the course of which earnest protests were made against the leases in question, and sportsmanlike appeals were made to the Government to preserve the magnificent trout and bass waters of the Province for local anglers and for those visiting sportsmen who come to Ontario for the fishing, and who make such generous expenditure of their money there. Much gratification will be caused by the announcement of Mr. Latchford that it would be nothing short of a crime to even consider applications for netting licenses in such magnificent waters as those of Lake Temagami, concerning the attractions of which he discoursed so happily that the reporters inform us that many of the members sighed quite audibly in the heated chamber for the cooling breezes of the cleverly depicted haunts of the big trout and bass. And such delightful fish stories were rehearsed from one corner of the House after another that even the biggest of them was allowed to pass without the raising of any point of order or any appeal to the rules of debate.

E. T. D. CHAMBERS.

The Nepigon, its Beauty and its Trout.

(Concluded from page 69.)

The bait fisher monopolizes most of the sport at Pine Portage. Occasionally the fly scores among the big square tails; but I'll take the minnow against the field every time. Nevertheless, it is delightful to cast your flies into the lovely pools and rapids and battle with the vigorous light-weights. That was my idea of it, so I did not propose to change my gait until I arrived at the headquarters of angling. Virgin Falls, not far away, above the rapids of the Great White Chute, clamor for recognition. Their claims should not be ignored, as a record breaker is as likely to be encountered here as anywhere. As fly-fishing did not pan out very well I concluded to move off up stream, so gliding up the narrow arm, above the White Chute, we portaged into Lake Emma. This pretty gem of the woods is inclosed on all sides by dense forests that shelter a few caribou; in fact, game is quite scarce along the river, but abundant further north. The rapids at Camp Minor that showed up ahead, were a welcome sight to us all. The pool below looked very enticing, but I was in no haste to sample its attractions. Promising an early call, I followed on after the guides. The carry is short and rough and can be avoided, if the birch is loaded light, by hauling it up the rapids by means of bushes and projecting limbs. The river above Camp Minor is placidly beautiful; it spreads out like a miniature lake, mirroring in its pellucid waters the beauty of forest and sky. A mile away it terminates in a precipitous mass of rock, while from the huge cleft in its rocky wall a vast volume of water and sound was projected far into space, deepening, as we advanced, to a muffled roar. It was the stentorian voice of Virgin Falls, calling from afar. Beyond the raging outlet we caught the gleam of white tents, but no sign of life showed up on our side. This was encouraging. The cataract dinned a thundering welcome in our ears as we stepped ashore at the last portage, between the river and Lake Nepigon. We had the pick of the camp sites, as there was no one on this carry to dispute possession. About an eighth of a mile from the landing a narrow path intersects the main trail, terminating in a stony platform, clothed with a sparse growth of vegetation that extends to the head of the falls. Here in this lovely spot close to a beautiful bed of wild flowers, we erected our permanent camp. Twilight was coming on apace, but the bright light of the camp-fire reflected from the cheerful faces of the guides, helped dispel the gloom after partaking of a bountiful repast and planning for to-morrow. I retired under canvas to be lulled to rest by the monotonous roar of the falls.

The next morning was spent getting ready for the evening fishing, and inspecting my wild surroundings. The view from the edge of the cataract was truly magnificent. Here the pent up waters of the lake leap with an appalling shout into the abyss below. Above the frightful tumult of fighting waters a wild droning hum pulses on the air, that presently resolves itself into a weird chant of many voices, rising and falling now far and sad, again wildly triumphant, like a war song, a veritable hymn of the forest. A few yards away from its base, the conflicting currents meet and form a whirlpool from the center of which, at regular intervals, a splendid jet of water was hurled upward to the skies. From my lofty perch I could overlook the camp of fly-fishers near the outlet; their white tents contrasting beautifully with the somber green background. There must be immense hooked-jawed trout lying up in the smooth current at the head of the falls, and there they are likely to remain, as death in its most frightful form awaits the daring angler and his guides, who dare encroach on the danger line, which is some distance above. Human muscle would avail naught against the powerful suction of the torrent, whose warning voice causes the very air to tremble. It is not necessary to tamper with this death trap, as there is a good place about an eighth of a mile

above, where the waters of the lake take their first step downward. Here, close to the head of this dangerous rapid, are any number of trout that will scale from 4 to 6 pounds. Large trout that know not the wiles of the angler are constantly working in from the lake. This would mean glorious fly-fishing, but, alas! the great depth of water near the center, where most of the fish resort, hopelessly precludes success, except on those rather rare occasions when they seek the surface. The little fly pocket close up to the west bank, is the fly-fisher's hope, and a pretty slim one at that. Seldom does a big fish appear in its shoaling water. I never met with any success below the falls, except with wall-eyed pike, which I took up to 5 pounds, but not on the fly.

Our tent, at first, was pitched close to the path, in close proximity to hornets, that eventually caused us to move off nearer the falls. Occasionally a band of Indians halted at our camp to chat with the guides. They appear to lead a happy care free life. These merry children of the forest are possessed of many sterling qualities. To their bravery and consummate skill in handling the frail birch in running the rapids, many a sportsman is indebted for his life.

The swift current of this river is often a deadly trap to the unwary. Alas! in the midst of our woodland joys, like a bolt from the blue, came the harrowing account of the bright young life that was quenched forever in the cold embrace of the canal rapids. This deplorable accident could have been easily avoided despite a solemn warning from the guides. Mr. Andrews, accompanied by his son, both good canoemen, but unacquainted with the conditions that prevail on the river, paddled out on to the deceitful surface that masks the most treacherous piece of wild water on the river. So insignificant is the outflow that its siren voice dies away to a vague musical murmur, as if entreating a closer inspection of its mysteries. Their sense of danger lulled to sleep, they allowed the canoe to cross the danger line, and before they could fairly realize their awful peril or lift a paddle in self-defense, the canoe with its human freight was sucked into the ravenous maw of the monster, beneath whose puny form exists a world of hidden strength, in vicious whirlpools and cross currents that palsy every effort of their prey to escape from their iron grip. The father miraculously escaped, but it was many days before the river gave up its dead.

Familiarity with danger often breeds contempt. I remember one time, in running the rapids at Camp Minor, my cap dropped behind me. I half turned to recover it, when the warning voice of the head guide caused me to desist until the worst was over. The smart set and fools we have always with us. The mortality in the ranks of these know-it-alls would be much greater if it were not for a wise dispensation of Providence that is popularly supposed to keep a watchful eye on their comings and goings. These wisecracks declaim about various phases of wood life, to their unhappy guide, who pays little attention to their prattle, but keeps a sharp watch on their movements, lest they stray off, and like the politician know no North, South, East or West. Place one of these boasters in a strange part of the forest on a cloudy day, and his wisdom will soon depart from him; his wood lore will go up in the air, and after wasting time and strength shouting himself hoarse, and running hither and yon, with movements as erratic as the antics of a decapitated hen, his strength wanes. Reason resumes her sway, a brilliant thought flashes through his brain, and he promptly acts on it. His rifle sends its far-reaching voice reverberating through the forest; to his joy a faint sound drifts down to him; his rifle talks again; he listens eagerly as the same weird answer throbs on the air, that after one or two more coaxes resolves itself into the far away report of a rifle; the noisy conversation that now takes place between them ceases to be interesting.

Men are lost with compasses, as well as without them. The skeleton of a man was discovered in the crotch of a tree, his compass and his outfit deposited at the foot. A very sad case occurred recently of a man who separated from his companion, and never rejoined him; he was eventually found dead in the woods, his compass beside him. All this leads up to a rather thrilling experience that happened near Virgin Falls, to one of my Indians. Joe Salt, the head guide, came to me one day and informed me that the boy had been lost, he had strayed away from camp to get fire wood, and lost his bearings. The situation must have puzzled him considerably, as he was out for some time. It is true he was a boy, say about 18, but he also was an experienced woodsman and trapper. The average sportsman under such conditions would have been utterly unable to extricate himself. It is a different matter with these half-breeds; they are very resourceful, and can manage to exist and suffer hardships that would speedily put the civilized mortal out of business.

I fancy some of my readers are growing impatient to know more about the fascinating, also exasperating ways of the Nepigon trout, so taking the hint, I will reel up the line of my subject and prepare for a fresh cast. Any disbeliever in the cunning and agility of these speckled acrobats can have his doubts dispelled in the rudest manner by taking a hand in the game that is in full blast almost any summer evening at the outlet of the lake. This romantic spot is well patronized by the knowing ones, who use the natural or artificial minnow and reap their reward. Far different with the little band that haunts the fly pocket and worships at the shrine of the Parmachenee-belle. The treasures of the fly-book are sampled occasionally by the smaller trout, but the big speckled are away off.

For the benefit of the tyro, I will now give the modus operandi of bait-fishing. Hook your minnow through the head, the mouth is like wet paper. Make a smooth cast; after getting your bait afloat the current will do the rest. The angler must pay out at least 35 yards of line. It is impossible to approach much nearer the rapids with safety. Now put some life into your minnow, and you will soon have a taker, unless, as occasionally happens, they are off their feed. Watch out for the slightest pull and strike instantly or your quarry will elude you. Once fairly engaged in a bout with one of these heavy weights, he will keep you guessing from start to finish. You will need to manipulate and often to release the reel with lightning quickness, to foil his crafty jerks, and often prodigious leaps. Meanwhile keep up a killing strain on

the rod and promptly take up the slack. They are often towed in apparently done for, but with something "up their sleeve." The sight of the net sometimes puts new life into him, so look out, or he will do the trick yet, and depart amid a torrent of water and imprecations if the angler is of an irascible temperament. A large fish struck on the edge of the white water is almost invariably lost by tearing loose. The cruel pressure that has often to be applied to draw him away from the friendly embrace of the rapids frequently tears the ligaments of his mouth and eventually releases the hook. I lost an immense trout from this cause. Another good one that I fastened to on the edge of the snowy water broke away. A hoodoo occasionally settles down on the most skillful angler and palsies all his efforts. Fish are struck, played, lost repeatedly; tackle goes back on him; he glares at his innocent rod; the water and the jolly anglers who bask in the sunshine of luck. It is bitter medicine, but we've all been there many a time. Under such circumstances it is far better to return to camp before you get yourself into trouble with the recording angel.

Choice of position at the outlet is generally at a premium, but one ideal evening my canoe glided out on to its quiet surface to find it deserted, with not an angler in sight to dispute possession. I lost no time getting a line out, calculating that the usual crowd would appear later on. The superb fishing that I enjoyed that evening will linger long in memory. The sport was fast and furious; beautiful specimens were gathered in, all game to the last gasp. Our lone canoe patrolled back and forth, varied by seeking the quieter water, with some unwilling captive in tow. Where were the boys to-night? I gave it up, and busied myself with the merry trout. The sun had long since sunk to rest behind the green canopy of forest, the hoarse voice of the rapids seemed muffled amid the advancing shades of twilight. Dim shadows encroached upon the fly pocket. It was the angler's hour, but no gay moth, resplendent in orange and white, fluttered about upon its darkened surface. It was deserted by the lovers of the gentle art, all my trout were captured with the minnow. This is the best lure for large trout. Nevertheless the record trout of 1902 was taken on a Jock-Scott fly, weight 6¾ pounds. This gleam of luck brightened the future of some happy fly-fisher.

The well-known freakiness of the Nepigon trout often adds an exasperating uncertainty to the sport. One afternoon I repaired to the head of the rapids to have a bout with the big fellows; but not a sign of life showed above or below. The still water mocked us. The guides soon sized up the situation and headed the canoe for the west bank, and trotted off down the trail with their burden. I asked no questions, but let them go their own gait. Presently they arrived at the foot of the white water, and depositing the birch close in to the shore, prepared to embark upon the mad current of the river, that scarce a paddle's length away was running like a mill race, threatening to sweep our frail bark within the mighty clutch of the torrent. The roar of angry waters dinned in our ears, while the veil of misty spray that hovered above the falls threatened to be our winding sheet, should nerve and muscle fail us. The coveted spot that the guides aimed to reach lay at the foot of the rapids. Brave and confident, they fought their way across the first stretch of wild water, taking advantage of every swirl and eddy, and eventually landed the canoe in a sheltered haven, between the divided waters of the chute. Down went our heavy stone anchor, and out went our lines, but, alack, with no results. It was a day off with the trout.

The view from our point of vantage was grand and inspiring, the close proximity to Virgin Falls adding an element of danger and giving a new zest to our wild life on the river. From where we launched our birch to the opposite bank, is only a hundred yards or so, but the current sets in so strong toward the falls that no guides on the Nepigon will risk their lives in an attempt to cut across. Camp life is apt to grow wearisome at times, to vary its monotony I occasionally dropped down the river to Camp Minor, Victoria and Devil's Rapids. Our luck was indifferent, but it was a welcome change to get away from the promiscuous crowd that swarmed about Virgin Falls and have a good lonely time by myself. Black flies are quite tolerable up the river, but hornets are always with you, particularly at meal times. The absence of minnows frequently tempts the angler to backslide, and dally with the murderous spoon. To this complexion must you come at last, or something worse, unless you improve the shining hour, and lay in a good supply for future needs, and contrive some place for keeping them alive. A minnow bucket would help solve the question. For bass fishing I use a canvas bucket of my own invention. It can be carried in a large pocket.

To illustrate the ill success of the fly among the larger trout, I will state the case of two old fly-fishers at Camp Minor. They had caught one good-sized trout and a limited number of small ones. One of their trout weighed exactly one pound; this little fellow was kept, instead of being tossed back contemptuously where he came from. This sort of thing helps depopulate the river of its smaller trout, and thins the ranks of the big ones.

The knights of the fly-rod gaze longingly toward the north and dream of virgin waters. There is a wealth of hunting and fishing hid away in the northern wilderness awaiting the advent of the hardy sportsman. Alas! many of the anglers that frequent the river are past the prime of life, others are physically incapable of withstanding the rigors that are inseparable from camping out in a wild country. The trout-haunted Albany River is too tough a proposition for this feeble band of anglers to entertain for a moment. The best advice I can give to this class of sportsmen is to camp near some of the pretty trout brooks that empty into Lake Nepigon. Here they will elude the crowd and find rest for their souls. This mighty feeder of the river is about 70 miles long by 50 wide; its broad bosom is studded with beautiful islands, many of the larger ones abound in white birch, and are the favorite resort of the Indian canoe maker. The birches on the lake are seldom found large enough for one of those immense canoes, some of them capable of floating three tons or more. The material comes out of the far away northern woods, the lighter models are mostly in vogue; many of them are beautiful specimens of the canoemaker's art. Here I spent many a happy hour with my merry men, cruising in and out among its lovely isles, and camping on the shore of this half-breed's para-

dise. The lake is full of fish; the wilderness abounds with game; what more could they desire. The smoke from their camp-fires that ascended from the islands seemed to breathe a spirit of content and happiness. More than once Indian girls glided across our path, the soft dip of their paddles blending in harmony with their youthful voices, as they accompanied us, laughing and chatting with the guides. These dusky maids were the embodiment of woodland grace and comeliness. As we drew near one of the group of islands, the clamorous yelps of the huskies rent the air, our approach was viewed by the canoemaker and his wild brood with stolid curiosity that was quickly followed by smiles and good-natured badinage, as they recognized their half-breed friends. These wild encampments, with their primitive people, remind us of the ancient past, when the red man roamed these wilds happy at heart and free. No more does the wild refrain of the voyageurs smite the air in unison with their paddles, their voices dying away to a mournful cadence and blending with the far off sound of the rapids, the sighing of the breeze. That once mighty factor in the fur trade, the Hudson's Bay Co., still exists, but shorn of much of its strength and influence. Speaking of fur, reminds me of a bear that showed up near a deserted Indian village on the lake shore. One day while I was strolling about inspecting the interior of a hut, Joe Salt burst into the room, his face ablaze with excitement, shouting bear. Clutching an ax he started off at a good pace down the lake shore, closely followed by the rest of the outfit. We had not gone far before a dark object loomed up ahead. Approaching cautiously, we soon sighted a good-sized cub sitting up in the bushes, regaling himself with berries, seemingly oblivious of our presence. No friendly zephyrs wafted to his nostrils the telltale scent. His ears drank in no sound to warn him of our stealthy approach. It was a pretty piece of stalking. Our feet were shod with silence as nearer and nearer we came, until only a few yards separated us from the unsuspecting beast. At this stage of the game Joe drifted a trifle to the rear, I still continued to advance, but had scarcely traversed a yard before I attracted his attention; his flight was accelerated by Joe's ax that sailed through the air, close in his wake. I presently found out the reason why Joe hung fire, he was fearful the old she would put in an appearance; fortunately for us she was foraging elsewhere. It is vouchsafed to but few to inspect a bear at such close quarters in his native wilds.

It is surprising how little is known of the attractive features of this lovely lake. A native, who holds a responsible position, assured me that no trout existed in any of its tributaries, save a small brook choked up with brush. I discovered in the course of my travels no less than three trout streams, and got a line on a fine trout water that lies up in the northwest. It is not the Albany. I visited the little brook described by the half-breed, and found it practically free of obstructions in the only part worth fishing. A level stretch extends about 100 yards from the mouth, terminating in a shallow pool above. The stream shrinks to a mere trickle, overgrown with saplings and littered with forest debris. I have gazed into the pellucid waters of this mimic pool and beheld a sight that thrilled me with memories of bygone days. Packed close together, their heads pointing up stream, their fins gently waving, were as handsome a collection of speckled beauties as one would wish to see. Many were good-sized specimens for such a little brook. A steep incline led down on my side of the stream; the dense growth of saplings hindered my movements as I slyly edged down the bank, expecting every moment to see them scatter in every direction. Finally I managed to secure an uncertain foothold on the edge, scarce a rod's length away from the dense throng of trout, who paid little or no attention to my guarded movements. Scarcely expecting a rise, I flicked my fly among them. To my surprise it found a ready admirer; again and again I scored. Presently Joe appeared on the opposite bank and dropped his bait hook among them, and was soon busily engaged in yanking them out by the wholesale; 'twas a veritable murder of the innocents. I soon grew wearied of sport that required little or no skill, and returned to our camp by the Indian village; all the cabins are kept securely locked during the owner's absence; nevertheless, we got many a glimpse of interiors abounding in rude comfort. We gained access to one room and started a fire in a badly cracked stove; the guides preferred the open fire for cooking, but the stove and the rude protection the hut afforded were a mine of solid comfort when rough weather set in. Potatoes and other vegetables grew in the little clearing. There seemed to be no trodden paths of any account. It must be a wild, desolate place in winter when most of the huts are occupied by half-breed families, nearly all the able-bodied Indians are off trapping in the frozen North. The immense wilderness, northwest and east of Lake Nepigon is the happy hunting and trapping ground of the Ojibway. It is traversed in every direction by the Indian trapper in pursuit of fur.

Poplar Lodge is another resort of the half-breeds. Here provisions can be procured, but it is best to bring in a good supply from the railroad. There is a creek that comes in on the northeast, whose upper waters have never been explored, unless by some wandering trapper. The resources of this wild stream seemed shrouded in mystery. It was Joe's idea to enter the creek and paddle up toward its headwaters. This suited me exactly, so one sunny afternoon our birch entered the mouth of the creek and glided up stream. The water near its entrance was quite deep with no perceptible current, but further up I hoped to strike swift water and fish. As we advanced the stream narrowed, and the woods closed around us; the banks were lined with that beauty of the woods, the white birch, which made a dazzling contrast against the greens and grays that composed the sombre background. Charming effects of light and shade were strewn along our pathway. Every turn in the stream disclosed enchanting views of woods and waters, bathed in a haze of mystery. We were afloat in a forest that extended without a break to the Arctic Circle. No sign of life appeared upon this lonely stream, save the tracks of wild animals. Grimly suggestive was the listening silence that pervaded this haunt of the moose, caribou, and many beasts of prey.

The Indians gazed about with wondering eyes at the magnificent forests that hemmed us in on all sides and dreamed of happy hunting grounds. This wild

woods beauty found her counterpart in the stream below, along with the gliding birch and voyageurs. Here and there a likely bit of swift water was encountered that suggested trout, but the rod slumbered until the head of canoe navigation had been reached. The creek had changed from grave to gay, 'twas now a laughing brook, vaulting over the rocky barriers that opposed it and romping down the slopes with all the gayety and abandon of youth. The shadow of the angler and his rod had never been cast across its virgin pools, no eyes had ever gazed upon this beautiful rivulet, except, perchance, the timid doe, who wades amid the purling shallows of the brook and quaffs its molten silver. Its mimic pools and rapids looked the fit abode of finny beauty, and so it proved, as the first cast brought to light one of its speckled denizens. I soon towed him into the waiting net and cast into the pool above, expecting to score immediately. To my surprise the feathered cheat was spurned. I fared no better in the swift water, so passing the rod over to the boy, I watched him tickle the sullen surface of the stream; he did his prettiest, but failed to draw the old mossbacks from their cool retreats. Twilight would soon invade this forest sanctuary; 'twas time to depart before night closed in around us. As I passed by the pool that had queered me I relieved the boy of the rod and made a farewell cast, a fish sprang at the fly, my little steel rod soon conquered him, and I passed him over to Joe. The net results were nothing to boast of, but as only a small portion of the stream was flogged, it served its purpose. Trout were here and no angler had preceded me up the brook. All the joys of a discoverer were mine. The trout of these hidden streams have their freaky streaks, but when they are on the rise 'tis often an embarrassment of riches. The little brook near our camp was alive with square-tails, that seldom refused to respond. 'Tis an arduous task and not devoid of danger to penetrate to the source of one of these wild waterways. The trout of these forest brooks are diminutive in size, according to the Nepigon standard, but considering the exquisite beauty of their environment, a trout of a pound of two crealed where the wild sweet song of falling waters throbs upon the air, will cause the angler's heart to thrill. Vain is the effort to enter into these woodland joys at middle life, the worshipper at the shrine of the beautiful in nature, like the poet generally, comes into his heritage in the golden dawn of life.

One day I gave our nearby brook a look in, but alack! 'twas bank full and swollen from recent rains. I managed to decoy one good one to the net, but failed to raise another. There was nothing to do but back out. Instead of returning to camp, the guides took out down the lake; I asked no questions, as I knew they had something that they would produce in due time. The lake seemed barren of animal life, no deer were sighted, feeding along the shore or wading in the shallows; in fact, nearly all the wild game has been driven back into the wilderness by Indians. The endless succession of primitive woods and pebbly beaches unrelieved by mountain ranges, caused me to lapse into a state of dreamy ease that harmonized with the low wash of the waves breaking on the rocks. I was soon aroused from this feeling of languid indifference by the magical transformation that was gradually taking place along the lake front. Towering masses of rock loomed up ahead of us. As we drew near they took on the weird semblance of castles, spires and other spectral shapes; it was the enchanted precipices of Bay View. Huge battlements of rock tower to the skies, their stony faces decorated with splashes of ochreous red, arranged in a variety of grotesque patterns. Vast columns shoot upward to dizzy heights, the fitting abode of the eagle and his mate; immense rocky platforms jutted out from the summit and hung threateningly above us, mocking the efforts of the daring climber to scale the rocky wall, while detached masses of rock of every conceivable shape and size, threatened to overwhelm the rash mortal that dare disturb their grim repose. I gazed with mingled wonder and awe on this masterpiece of nature that only needed the finishing touch of a war canoe filled with painted savages, from which arises an ominous chant breathing red death to their foes, scalps and victory for the conquering Huron. Slowly, like the figment of a dream, this wonderful pageant faded away in the distance, and the forest that had been rudely thrust aside by the stony giant crept timidly forth to line the lake shore with its dense array of foliage. We were now in a part of the lake that is rarely visited, except by the Indians, many of whom are but a few removes from their savage forefathers. You are likely to run across an Indian most anywhere between the lake and Hudson's Bay, but seldom or never a white man. As our birch, impelled by muscular arms, sped on its way, Joe cast searching glances ahead; presently he discovered the object of his quest, a break in the distant shore line, where the cold waters of a brook lost themselves in the lake, its coffee-colored flood frowned on the fly-rod, but helped float the canoe. As our birch, under the skillful handling of the guides, wriggled its way upward, I was impressed by the utter absence of animal and bird life along the stream; the sweet songsters of field and meadow shun the grim Canadian wilderness. The brook gradually shrank to a bed of boulders and gravel bars littered with fallen timber. Finally the canoe came to a halt before a menacing array of nature's forces that barred our passage up the roaring brook. Here we abandoned the birch and took to the woods; I made a languid attempt to penetrate the tangled undergrowth that lined the banks, but soon gave it up, as the turbid water of the brook derided the efforts of the fly-rod. The Indians had disappeared, the rod and canoe slumbered, but the glorious forest that towered far above me, its foliage freshened by the recent showers, while stray gleams of sunshine invaded the dim recesses of the woods, bringing to light with the deft touch of the artist exquisite effects of light and shade, put the finishing touch to all this wild-woods beauty and held my wandering thoughts captive until the guides returned. They had secured one diminutive trout, but failed to connect with others. The rough handling that they experienced between the brook and the tangled network of vines and all manner of forest debris, must have been a caution. The high water gave them the choice of floundering through deep holes or thickets. The Indian is at home in the woods, and reck little of hardships and dangers that would phase many a paleface. Embarking on the mimic flood, we soon exchanged the musical gurgle of the brook for the solemn wash of waves

against the base of the painted precipices of Bay View. These grandly beautiful scenes of lake and forest will be remembered forever and aye. The summer had departed, but no maples flung their red banners to the breeze; the prevailing autumn tints are dull orange shading off into yellowish green.

The trout fishing of 1902 would soon be a thing of the past, so it was up to me to strike camp and return to the river for a few more casts before the warden made his last rounds. As the huts and clearing faded away to an indistinct blur, the mighty lake opened out before me; far away in the northwest sky and water meet. Lovely isles clad in purple haze seemed like fairy craft floating on the blue expanse of waters; below there is a wealth of finny life that insures good angling in the river for many years to come.

We slept that night in our old camp at Virgin Falls. My stay was not prolonged, as I was eager to wet my line in Long Rapids, the place par excellence for fly-fishing. The day of departure came at last; regretfully I stole away from pleasant scenes that will not be forgotten while memory lasts. The rapids at Camp Minor were negotiated for the last time. As the swift current bore us along, I cast farewell glances at the moving panorama of rocks, sky and water. I was using the fly on the down trip to the utter exclusion of bait. All sneers at Pine Portage failed to swerve me, as I was banking on having a good time with the trout. At Long Rapids the trout were beginning to work up on to the spawning beds. Fly-fishing does little to thin the ranks of the big spawners, but bait plays havoc. Quite a crowd of fishermen were hanging around the edges of the pools at Pine Portage, getting ready to lift them off the beds before they had a chance to deposit their spawn. The only remedy is to allow nothing but fly-fishing from the first of September to the close of the season, and make it obligatory to return all fish hooked under a pound. The best trout exhibited at Pine Portage looked about four pounds, a very common size in the old days, but a prize now.

I soon bade adieu to the noisy conglomeration of guides, anglers and pot fishermen, and dropped down the river and camped at the Narrows. Here the boy managed to secure a nice one with bait. One rise was the best I could do before darkness set in. The weather looked threatening for the morrow. Sure enough, at daybreak a drizzling rain had set in. Undaunted by the dreary prospect, we glided out on to the troubled waters. I whipped them thoroughly, but no sign of life appeared upon the ungrateful surface. The pattering rain drops were anything but a pleasing accompaniment to the swish of Joe's paddle as we pushed out into Lake Jessie and headed for the last station on the river, in company with another birch containing two young enthusiasts whose acquaintance I had picked up coming down from Pine Portage. The guides kept up a steady clip for nearly two hours before the far away sound of rapids throbbed upon the air. Instead of following the usual custom of unloading at the landing, the canoe was allowed to follow the drift of the current and draw near to the white water. The prospect was decidedly ticklish. The human freight and camp stuff caused the canoe to sit low in the water, inviting disaster from careening in the grasp of the angry torrent. To offset all this, it was manned by two of the youngest, bravest and most resourceful guides on the Nepigon. There was no margin for clumsiness, as all along the watery track sharp rocks lay in wait, like assassins, ready to deal deadly stabs at the fleeing birch. Like a thing of life the canoe romps down the siding with the speed of a racer. Faster and faster it flies, while the sublime chorus of fighting waters shakes the air, presently to die away to a vague far off sound as our birch glides victorious out on the peaceful expanse of the pool, while scarce a hundred yards away, at its outlet, the dreaded Long Rapids lift up their strident voice, threatening annihilation to the reckless fool that dares to brave their fury.

The other canoe wisely withdrew to the landing; at any rate no canoe shot the upper rapids during our stay. It is not every guide that cares to take the risky chances of running this wild piece of water with a loaded canoe. They generally take the safer course and hand the camp stuff over to the tender mercies of Pat and his team.

We pitched our tent near the outlet, close to a burnt patch that fortunately did not extend far; the lowering storm had drifted away, so I sank to rest with bright hopes of the morrow. The weather turned out all that an angler's heart could wish for during our brief stay. We had lively times with the trout, as the merry music of the reel mocked the kingfisher's rattle. We worked this beautiful pool along with two strangers. No one left unrewarded. It was trout galore. For all that, it takes an experienced rod to win success among the two and three-pounders that haunt its depths. There is a fine cast from off the island close up to the white water. The season was flickering, ready to vanish, so we moved off down the river, and after making a few casts opposite Cameron's Pool that failed to draw, I bade adieu to the delights of the rod and the reel. The camp-fire flared for the last time at Alexandria Bay, bringing into strong relief the supple forms of the Indians and their wild surroundings.

My Nepigon guides deserve more than a passing mention. Young, ambitious, and clever, their cheerful presence and merry laughter would stampede the worst case of blues in existence. Joe Salt has quite a reputation as a hunter. They displayed marvelous skill in using an ordinary landing net, to capture the curious whitefish and laker.

A favorable breeze set in next morning, but we did not get the full benefit of it until we glided out on to Lake Helen. Utilizing the tent cover for a sail, we sped down the lake humming. The guides for some reason shunned the landing, and dropped down the outlet and fetched up at the Railroad Pool. This relic of ancient times is quietly recuperating, as Joe informed me that parties hurry by, imagining it is a dead one. It is only a short walk from the village to railroad bridge. Drop a line here, brother angler, and the answer you will get may astonish you, as large trout are liable to work up into the pool from Gitchee Gumme at any time. The attractions of this mighty river have been lauded to the skies by interested parties and derided by others. The beauty and size of its trout, the sublime precipices of Caribou Mountain, its magnificent rapids and lovely gems of pools that mirror their rocky setting, and the glorious forest, along with the entrancing views on its upper lake and waters,

are a sufficient answer to its carping critics. May the time be far remote when the angler will cast his fly in vain in the waters of the noble Nepigon.

W. C. SQUIER, JR.

RAHWAY, N. J.

CHICAGO AND THE WEST.

A New Sporting River.

CHICAGO, Ill., July 23, 1903.—Mr. W. H. Talbot, of Nevada, Mo., is in town this week for a few days' visit. Mr. Talbot is well known as a maker of fine casting reels and is moreover an enthusiastic fisherman. He offers a bit of news on high class angling in a little known part of the country. Mr. Talbot says that his new sporting district is along the Niangia River, which in his case was reached by a sixty mile drive from the town of Bolivar, Mo. This same stream, well towards its head waters, can also be reached from Lebanon on the 'Frisco road, at a distance of about thirty miles, or from the town of Bagnel on the Missouri Pacific, by means of a drive of some fifteen or twenty miles. The Niangia River has two forks and the united stream flows into the Osage River. One would hardly expect to find small-mouth bass in this part of the world, let alone rainbow trout, yet both are to be taken in this stream in heavy weights and full of the best sort of sporting quality. The stream itself is a very crooked one, the bend on which Mr. Talbot's party encamped having a distance of some twenty miles' fishing in two and a half miles' distance across the head and foot of the bend. The banks of the stream are high and well wooded and the current is swift, although the stream is very crooked. It can be fished from a boat or in part by wading, as there are shallow and gravelly riffles alternating with the deep holes on the bends. In part the bed of the stream is strewn with boulders, and in these fast waters the small-mouth bass and rainbows lie. Mr. Talbot told me that without exaggeration he believed a good bass fisherman could take one hundred bass in a day on that river at this time of the year. He himself fished until he did not care to take any more, most of the fish being returned and a few being given to the neighbors along the stream. One gentleman of the party got a 4¾ pound rainbow trout. Mr. Talbot saw a thirty-five pound "salmon" which was caught in the Niangia. This is the same fish as our Northern wall-eyed pike, and this weight is a very extraordinary one. The natives sometimes catch channel catfish in the Niangia and these put up a game fight, as any one knows who has angled for them. Mr. Talbot says he thinks there is no river in the country which is more attractive to the angler with either bait or fly than this same stream, which is practically unknown in this part of the world. Its remoteness from railway points of access is of course the immediate cause of this state of affairs. The rainbow trout were introduced there some years ago, and in these swift and well aerated waters they thrive extraordinarily.

Mr. Talbot says that they had a perfectly peaceful trip on the Niangia except in one instance. Their camp was pitched on the opposite side of the river from a gentleman who makes his home on his plantation there, and the latter was disposed to go on the warpath because the entire party did not pull up stakes and go and live at his house. The planter had eleven men at his table one day and he had only seen two of them before at any time in his life. He considered it, however, his province to take care of all strangers appearing in that neck of woods. Mr. Talbot was fishing peacefully at a seductive part of the stream when he heard a couple of reports of a shotgun on the bluff above him. Climbing up to see what was the trouble, he discovered that one of the hired men of the afore-said planter had been sent out to get a couple of turkeys for this dinner. He killed two wild turkeys with the two shots, without any difficulty. There are a good many turkeys along the Niangia, and where there are turkeys there are, of course, usually deer in these Southern hunting grounds. All in all, this situation seems somewhat arcadian in its attractiveness, and it is certain that many sportsmen of St. Louis and other Missouri cities will be apt to avail themselves of its advantages. The best of this stream lies in Camden County. It is without question a much better fishing stream than the better known Current River. The Current is broad and rapid, and the Niangia is rapid, crooked and alternately deep and shallow. Mr. Talbot's wide experience as a bass fisherman gives weight to his enthusiasm in regard to this newly discovered spot.

About Muscallunge.

On the 8th of August Messrs. F. H. Wolff and Fred Hedgeland will start from Chicago on a novel fishing trip. They go in an automobile and purpose making a journey of 450 miles north into the muscallunge country of Wisconsin. They will try to get in as far as Trout Lake, which is some twelve miles from the town of Woodruff, Wisconsin. Their return will be by automobile, and the whole tour will probably cover at least 1,000 miles, if all goes well.

Mr. Wolff has frequently fished in the muscallunge lakes north of Trout Lake, and is to-day getting together his outfit for a little of his favorite sport with the giant pike. He says that he has found very good fishing in the Gresham chain of lakes, three in number, which are accessible by a short portage north of Trout Lake. He also thinks very well of Boulder Lake, from which stories of very good fish come down now and then. He says that the most successful muscallunge fisher who goes into that part of the country is Mr. Marion Lambert, of St. Louis, who spends a good part of the muscallunge season every year in that vicinity. On his last trip Mr. Lambert took 21 muscallunge whose weights ran from 18 to 32 pounds. He returned a number of smaller fish to the water. Mr. Lambert's method is not that of trolling, and he catches his best fish in casting live bait, and Mr. Wolff and friends have also found that bait casting is more apt to be productive than trolling in these days of edu-

cated muscallunge. The bait used in this new school of muscallunge fishing is usually a sucker weighing about a pound or so, and the casting is done from a stiff rod, so that the angler is able to pitch the bait quite a distance from his boat over the weedy bars where the muscallunge is most apt to be found lying. In this practice one of course needs a wired hook, but it is not necessary to use a shark hook in order to lard a muscallunge, and some fishers do not go larger than 60 in their selection of hooks for this purpose. Of course, when the muscallunge swirls up and strikes the sucker, the angler simply relaxes strain and lets the fish run away with the bait. Presently, just as in the case of a bass with a frog or a pickerel with a minnow, the muscallunge bolts the bait and makes a second run. The hook, therefore, is apt to catch him pretty well down in the gullet and does not need to be so very large in order to hold him. Mr. Wolff says that sight of a big muscallunge swirling up at a bait just as it strikes the water is one of the most exciting things he has ever seen in sport, and it far outclasses the heavy tug on the probably submerged spoon hook, which is usually the first indication of a strike when one is trolling.

In Little St. Germaine Lake this spring the Wisconsin Fish Commission seized a female muscallunge which weighed 84 pounds, and removed from the fish nearly six pounds of spawn, according to the story, the fish being then returned to the water. The commission retained this big muscallunge for a while and wired the United States Fish Commission and the Smithsonian Institute, querying whether they would like the muscallunge preserved as a specimen. It was not, however, killed, but returned.

The guides have a notion in these muscallunge waters that the nimble speckled frog is a poor sort of bait whether for trolling or casting for bass. One does not recall any instances of a muscallunge being taken on frog bait, but there is no ground for the local prejudice against the frog as a bass bait. Mr. Wolff himself, for instance, one time went out frogging and picked up a dozen or so, and his catch of bass that afternoon was a complete refutation of the theory of the guides that the bass in that country would not rise to the frog.

Singular Incidents in Fishing.

A week ago last Tuesday Dr. J. W. Meek and Mr. F. H. Wolff were down at Koutts, Indiana, attending the tournament of the Valley Gun Club. They took the opportunity to do some fishing in the Kankakee River, and found it no trouble at all to catch all the pickerel (pike) which they wanted. They saw no bass and say that local men like George Hoffer, game warden at Koutts, tell them that the bass fishing is ruined in that part of the river, which was once so notable in that specialty. The recent stories are true, and pickerel, innumerable carp and swarms of dog fish infest the Kankakee now. The Chicago men had a little sport with the pickerel in fault of anything better. In the course of this fishing, in which they had a number of pickerel up to 4, 5 and 6 pounds, Mr. Wolff hooked a good-sized fish and landed it in due time. He thought he felt something give, but the fish did not make its escape. When he got to it he discovered that the hook had broken off in the gullet of the pickerel, and the snap of the steel swivel, in passing out towards the mouth of the fish, had caught in the side of the cheek. Any one who knows how one of these spring snaps is arranged will realize that the tongue of the snap would act as a sort of barb, like the barb on the so-called barless hooks. At any rate it served to fasten and hold this big pickerel. One does not recall hearing of any similar incident in angling experience, yet the informant stated that this was the second time that the same thing had happened to him. Last year, while fishing for muscallunge in Wisconsin, the hook broke off in connection with a big sucker concealed in the anatomy of a heavy muscallunge. The swivel snap fastened the fish in the mouth, just as was the case with this Kankakee pickerel, and the old fellow was landed in this rather inglorious though singular manner.

Still another odd incident in angling seems to have taken place on the salmon river of Mr. Charles H. Davis, of Saginaw, the Little Pabos. Full information from Mr. Davis is lacking, but Mr. W. B. Mershon, of Saginaw, in a chance letter, refers to the matter in this way: "You should get full particulars of Mr. Davis' salmon story, for it is about as strange an occurrence as I ever heard of. The knot that fastened the leader to the line came untied after the angler had been playing this fish for a while. Each end of the pool was a shallow rapid, and the guides put a boat at each end and kept the fish from running out of the pool, and then chased it around until it got tired and took refuge under a log. Then with the gaff hook they carefully raised the leader and fastened it again to the line and Mr. Davis' friend finally landed his fish."

That certainly was a gentlemanly sort of guide who could have gaffed a salmon and gaffed the leader instead, and so let the fight go on to a finish under the proper rules of the game.

For the Nepigon.

Mr. C. D. Viele, of the Deere & Webber Company, Minneapolis, Minn., is chief of a party of five who start within the week for an extended trip on the Nepigon River. This party are outfitting with V. L. & A. of Chicago, under the supervision of Mr. Von Lengerke, who has been on the Nepigon and knows what is needed.

Slagle River Fishing Club.

The Slagle River, or, as it is better known, the Slagle Creek, of Michigan, has been considered for many years as one of the best trout propositions in the south peninsula. Its special virtues have not been overlooked, and now comes the information that there will presently be formed the Slagle River Fishing Club, which will take over and preserve a good portion of this stream. Mr. E. J. Marshall, of Toledo, O., is in-

terested in this work, and sends out a prospectus which he hopes may be interesting to Chicago gentlemen desirous of valuable club privileges on this stream. He writes: "You notice that we contemplate but twenty members for our club, and we believe that this is one of the finest propositions ever offered to the genuine sportsman. This property was purchased some years ago by Mr. Daniel Segur, of Toledo, an enthusiastic fisherman, and he has cleared the titles from the usual tax titles, etc. At current prices the land is worth more than the price put on it, so that you can see the undertaking is not made with a view to profit. We should be pleased to form a small club of gentlemen sportsmen who are interested in the sport. We expect to have some first-class gentlemen from this town and should be glad to hear from others of the right sort who want a membership in a good fishing club."

It is to be hoped that Mr. Marshall will succeed in his undertaking. The Slagle River rises in Wexford County, in Michigan, and flows westerly through Wexford and Manistee Counties, emptying into the Manistee River. It is a wading stream, with a bed of hard gravel. The water is extremely cold, clear and pure, and the supply inexhaustible and constant. The stream is neither meandered nor navigable within the meaning of the statutes of Michigan, and it is therefore a private water under the laws of the State. In Manistee County the stream is very crooked and for the most part quite free from brush and serious obstructions, rendering it an ideal fly fisher's stream. It is well stocked with brook trout, *Salvelinus fontinalis*, which are noted for their extreme gameness and high color, these qualities being attributable, it is claimed, to the very cold water and rapid current. The upper waters of this stream flow through a very dense cedar swamp, nearly impenetrable to man, and absolutely impenetrable so far as fishing is concerned. The State of Michigan has recently established a trout hatchery on this stream above the property which it is proposed to purchase. These facts guarantee undisturbed fishing grounds and insure an inexhaustible supply of fish. There are over five miles of stream on the property in question, and the greater portion of this lies within one mile of direct distance, the stream being so crooked that a twenty minutes' walk up stream covers a distance by water of fully three miles—sufficient for a day's sport with the rod. Mr. Marshall shows several letters from sportsmen who are acquainted with the Slagle, and will no doubt be glad to give further details upon request.

Chicago Fly-Casting Club.

The following are the records of the Chicago Fly Casting Club, at the last meeting on the North Lagoon, Garfield Park, this city:

Unhappy Trout Trip.

Messrs. C. C. Haskins, of the Illinois Trust and Savings Bank, and Mr. T. L. Smeads, also of Chicago, started out recently for a trout trip on a remote Wisconsin stream. Mr. Smeads tells the story of their experience. Mr. Smeads himself was a beginner in the game, but Mr. Haskins professed to be an expert

and supervised the outfitting and personal conduct of Mr. Smeads very carefully. They chartered a guide, who was guaranteed to take them to the best trout fishing in the country. Mr. Smeads declares that he and his friend Haskins crossed country where the foot of man never trod before or ever ought to have trod at all. Probably they got into a cedar swamp. Being a little short-winded, Mr. Smeads fell behind, and along in the afternoon was rejoiced to see his friend once more. Mr. Haskins was sitting on top of a high bluff, fighting mosquitoes. He asked of Mr. Smeads, as he toiled up to the same spot, "How many did you get?" "Three," said Mr. Smeads, producing that number of troutlets as long as his finger. "I got two," said Mr. Haskins. "Do you mind if I put them in your basket? They tire me carrying them around." He produced two fish a little bit smaller than those taken by his friend. When these five were ensconced in his basket Mr. Haskins, with a wild whoop, jumped on the creel and pounded it and its contents into a shapeless mass. "That's what I think of trout fishing," said he. About that time they saw a bent figure toiling towards them in the distance. It was the guide. He had 112 nice ones.

Some Catches.

Messrs. E. T. Hyland, Walter Brophy and A. Cuttler brought back some good bass from their recent trip to Fox Lake, Illinois, where for a time the bass went on the feed.

Mr. E. W. Brooks, of Chicago, took a twelve pound pickerel at Green Lake, Wisconsin, last week, and his party had eighteen pickerel in all.

Dr. W. F. Fowler took a five pound big mouth bass at Round Lake, Illinois, last week, and one or two others stopping at Smith's place nearby had good takes of bass.

Mr. Albert Smith was high hook on Pawpaw Lake, Michigan, last week, with a three and a half pound bass, although this is not extraordinary for that water.

At Nippersink Bay, adjoining Fox Lake, Illinois, the bass have been rising for the knowing ones for the last week or so, although it is generally conceded that the best of the bass fishing is now over and that the big fellows have retired to the deeper waters.

At Twin Lakes, Wisconsin, Norman Manzer, a boy seven years of age, last week was lucky enough to take a twelve-pound pickerel. The kid is somewhat noted as a fisherman in spite of his tender years.

At the Lauderdale Chain of Wisconsin fairly good bass fishing has been the rule during the recent cool weather. One of the clerks of the St. Paul office here, who returned this week, said that if a man was a good bass fisherman he would have no trouble in picking up a good string in the Lauderdale district. He reports pickerel also numerous, and says that there are a good many squirrels in the woods thereabout.

There are several Chicago parties at Travers Lake, Michigan, and among the lucky anglers are Messrs. Cameron and Cisler, who in one day's fishing during the week took fourteen bass.

The Sand Fly and the Bass.

For four or five days cities along the west shore of Lake Michigan have been persecuted by innumerable swarms of sand flies, which have been hatching out somewhere about the lake in a most copious and unrestrained manner. When the sand fly hatch is on on any of the bass lakes of Michigan or Illinois, then is the time for the fly fisherman to get busy.

The Man and the Mule.

There appeared in the FOREST AND STREAM office today a gentleman from southwest Iowa, who for personal reasons does not wish to have his name made public. This gentleman is a sportsman and has been a warm admirer of the FOREST AND STREAM for many years. He is here on the single errand of receiving the Pasteur treatment for a mule bite. A few days ago he had the misfortune to be bitten by a mule, which local authorities subsequently declared to be in a rabid condition. The animal caught him by the ankle and hung on, and had to be pounded loose. This sportsman does not want to come down with mule hydrophobia, and it is cheering to be able to say that there seems to be no doubt whatever of his perfect and prompt recovery.

E. HOUGH.

ASHLAND BLOCK, Chicago, Ill.

A Convention for Lobster Discussion.

CAPT. JOS. W. COLLINS, Chairman of the Massachusetts Commission of Fisheries and Game, has sent out to the fish commissioners of the New England States and Maritime Provinces a call as follows:

"A convention of commissioners of the lobster-producing States and the British Maritime Provinces will be held at Room 249, State House, Boston, on Wednesday, September 23, proximo, for the purpose of considering what can be done to secure a better protection of the lobster, and, if possible, to obtain laws which are as nearly uniform as possible in the various States and Provinces.

"You are cordially invited to attend this convention, which we anticipate will be one of the most interesting and important ever held for the purpose of trying to prevent the ultimate commercial extermination of the lobster."

The Game Laws in Brief and Woodcraft Magazine.

THE Brief, bearing date of July, 1903, for the term July to October, contains all the game and fish laws of the United States and Canada (except Tennessee and Washington) revised to date. The year has been extremely prolific of new laws, and the changes are numerous. There are also contained in the Woodcraft Magazine of the number these capital sketches and stories: Fishing Signs of the Zodiac, by Fred Mather. Vacations in Tents, by F. Brown. The Ways of the Black Bass, by Dr. Tarleton E. Brown. A Night Adventure on the Levee, by Tripod. The Joy Crocodile Hunting in Cambodia. About the Devil's Blowdown, by Buckskin Brady. The White-Headed or Bald Eagle, by Alexander Wilson. He Killed the Hog; Hog Killed Him, by O. G. Naund. The Shortened Shirt, by Andrew Price. Styx, a Battery Dog, by F. W. Caruth. Exploits of "Old Shacklefoot." The Hill Fox in Scotland. A Beaver Skin Cap. The Sportsman's Den, by C. L. Bradley.

American Fisheries Society.

THE thirty-second annual meeting of the American Fisheries Society was held at Wood's Holl, Mass., on Tuesday, Wednesday and Thursday of last week, United States Fish Commissioner Geo. M. Bowers presiding. The sessions were held in the biological room of the Fish Commission Station. The convention was characterized by a large attendance, representatives being present from all the New England States, New York, Ohio, Michigan, Wisconsin, Montana, West Virginia, North Carolina, and Georgia. The papers read were: "Blood as Fish Food," by Dr. James A. Henshall; "The Live Food Problem," by Chas. G. Atkins; "Propagation of Large-Mouthed Black Bass at San Marcos, Texas," by John L. Leary; "The Golden Trout," by W. T. Thompson; "Fish on the Farm: What Species to Select; Some Facts Showing the Commercial Value of Fish-Culture in New York State," by John D. Whish; "Some Notes on Fish Food in the Seiners," by Henry D. Ward; "The Main Points Necessary to Successful Bass Culture," by J. J. Stranahan; "Angling for Carp and Some Hints as to Cooking," by S. P. Bartlett; "Recent Advances in Lobster Culture," by Dr. A. D. Mead; "Transportation of Green Brook Trout and Salmon Eggs," by Waldo S. Hubbard; "A Fatal Excess of Dissolved Air in Water Containing Fishes," by U. C. Marsh.

The officers elected were as follows: President, Frank N. Clark, of Michigan; Vice-President, Dr. Tarleton H. Bean, of New York; Recording Secretary, George F. Peabody, of Wisconsin; Corresponding Secretary, W. DeC. Ravenal of Washington; Treasurer, C. W. Willard, of Rhode Island; Executive Committee: E. W. Blatchford, of Illinois; C. C. Ward, of Massachusetts; R. D. Hume, of California; M. E. Merrill, of Vermont; J. E. Leary, of Texas, and E. A. Tulian, of Colorado.

The place of meeting for 1904 is as yet undetermined. This was left to a committee. It is possible that the Society will meet in St. Louis.

An important feature of Wednesday was the unveiling of a tablet on the grounds of the Fish Commission in memory of Prof. Spencer F. Baird. The memorial had been provided by members of the Society. Addresses in celebration of Prof. Baird's services in behalf of fish and fisheries and biological science was delivered by Hon. E. W. Blatchford and Prof. Wm. K. Brooks, both of whom had been friends and associates of Prof. Baird. Messrs. Frank and Clark, and Livingston Stone recalled Prof. Baird's special public services in the early days of fish-culture in America.

State Fish and Private Waters.

Editor Forest and Stream:—

I take it from your review of the decision in the Rockefeller-Lamora fishing decision that an owner has the right, after taking State fish for his brook, or consenting that they be placed in his brook, on his own farm, to sue for and maintain action for trespass at pleasure. In other words, to allow those of the tax-paying public that may please his fancy to whip his stream and others, less fortunate, to do so at the risk of landing in justices' courts for nominal damages, and also to permit the owner, under the same circumstances, to lease the banks and bed of his stream to private parties with trespass suits galore in sight for the people that propagated and paid for the fish.

I note that you state in your editorial, "That right is of the exclusive possession of one's own property." How about the people and their fish? If this is justice, if an owner can at pleasurp take trout from our State fisheries and place them in his brook with no obligation to the people, then why this propagation of fish at the public expense? Why the State hatchery, if the people have no rights in their own property? It seems to me there are a few more "cobwebs" yet to be brushed away.

X. Y. Z.

A Giant Horse Mackerel.

MORE than 2,000 persons stopped in front of the store of the Gloucester Fresh Fish Company to see the immense horse mackerel that was on exhibition. The sea monster's weight is 1,180 pounds. It is more than ten feet in length and four feet thick. News that the fish was on exhibition traveled fast, and among the many fishermen who saw the monster were two old timers. When asked what they thought of the fish they said in unison that "it was the goods."

The mackerel was caught in Carr's traps off Magnolia after a desperate struggle. Monday afternoon the fish found its way into one of the traps, but escaped. The men at the traps determined to recapture the fish if it took a lifetime. Yesterday morning the fish very foolishly returned to the old stand and got nipped, first giving the men a run for their money.

The monster's value is placed at \$50. Several offers to buy were received by the company while it was on exhibition, but the company is not ready to part with the find. Last season a horse mackerel weighing 840 pounds was caught in one of the company's nets, but the catch of yesterday puts all previous records in the shade.—Boston Globe.

Walleyed Pike in the Susquehanna.

ARTON, N. Y.—Thanks to the Fish Commission of this State, the walleyed pike fishing in this section of the Susquehanna River which for years previous has been very disappointing, is now each season growing better, and good catches are made almost daily. Fishing near this place Saturday, I caught nine pike and four black bass, the largest of the pike weighing 8¾ pounds, and that after it had been carried in the boat all day in the sun. Other catches were: Richard Burton, eight, weighing 30 pounds, the two largest six and five pounds; C. B. Yapple, one weighing 7¾ pounds; Edward Curtis, one of eight pounds; David Bunce, about four miles out of here, has fourteen in the past few days, the largest about pounds. Between here and Bainbridge there have been taken several hundred fish, some of large size. It is safe to say that within the past two years more pike have been taken in this immediate vicinity than had been taken the twenty years previous. We understand also that in

the headwaters of the Delaware, near Hancock and Lordsville, the fishing for pike is unusually good, large catches and fish of great size are taken.

The conditions of this section of the river for the propagation of pike are ideal. Good water and deep; in many places large rocks and in others sunken logs and a sand bottom make abundant hiding places. There is but a single drawback to the bright side of the picture, and that is the carp are growing at an equal or faster rate than the pike. Still, the game fish seem to thrive in spite of the water hogs. Carp have been taken on the flats after the high water weighing 26 pounds. They keep the water in muddy condition all the time. There is no doubt that they destroy many of the fry of the black bass and pike. An effort will soon be made with the consent of the Fish Commission to see if the use of a drag net will reduce their number. In the past seven years each year the commission has sent to this one place 500,000 fry of the pike alone. And we are indeed glad that through the FOREST AND STREAM we can add our mite of praise for the grand work they are doing for the angler.

The Kennel.

Fixtures.

- Oct. 6-9.—Danbury, Conn., Agricultural Society's show.
- Nov. 3-6.—New York.—Annual show of Ladies' Kennel Association of America.
- Nov. 9.—Fourteenth annual beagle trials of the National Beagle Club of America. Charles R. Stevenson, Sec'y.

Pointer Club Matters.

NEW YORK.—At a meeting of the board of governors of the Pointer Club of America, held July 22, it was resolved that the field trials of 1903 shall be held at Holmdel, Monmouth county, New Jersey, three miles from Hazlet station, N. J. Central Railroad, commencing November 16. Judges, Bernard Waters and G. Muss-Arnolt.

C. F. LEWIS, Secretary.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

America's Cup Races, Aug. 20 and alternate days. AUGUST.

- 1. Beverly, third Corinthian, Monument Beach.
- 1. Atlantic, club, Sea Gate.
- 1. Seawanhaka Corinthian, club, Oyster Bay.
- 1. Eastern, Marblehead to Gloucester.
- 1. Chicago, special, Lake Michigan.
- 1. Brooklyn, Y. R. A. of Gravesend Bay.
- 1. Manhasset Bay, Y. R. A. of L. I. Sound, special.
- 1. Columbia, race to Highland Park, Lake Michigan.
- 1. Royal Canadian, club, Toronto.
- 1. Penataquit Corinthian, open, Bay Shore.
- 1. South Boston, club, City Point.
- 2. Bergen Beach, club, Gravesend Bay.
- 3. Eastern, special, open, Marblehead.
- 4. Boston, Y. R. A., open, Marblehead.
- 5. Chicago, race to Milwaukee.
- 5-8. Corinthian Marblehead midsummer series.
- 6-8. Indian Harbor, Y. R. A. of L. I. Sound, specials and annual.
- 7-8. Pass-Christian, Southern Gulf Coast Y. A., Pass-Christian, Miss.
- 7-8. Milwaukee, open.
- 7-8. Lake Michigan, Y. R. A., meet at Milwaukee for all classes.
- 8. Seawanhaka Corinthian, club, Oyster Bay.
- 8. Corinthian, fourth championship, Marblehead.
- 8. Moriches, novice race.
- 8. Beverly, fourth Corinthian, Monument Beach.
- 8. Royal Canadian, Canada cup race.
- 8. Shelter Island, Y. R. A. of L. I. Sound, annual.
- 9. Chicago, cruise, rendezvous at Charlevoix.

THE Regatta Committee of the New York Y. C. have officially selected Reliance to defend the America's Cup against Sir Thomas Lipton's challenger, Shamrock III. The committee reached the conclusion that Reliance was a far better all around boat than either Constitution or Columbia early in the season, and their decision meets with general approval. Columbia has been outclassed from the start, and Constitution has met with so many mishaps that she was too unreliable a boat to be seriously considered while she was rigged with double spreaders. Only one official trial race was sailed, and Reliance won that with ease. A full account of the race will appear in our next issue.

New York Y. C. Cruise.

MONDAY, JULY 20—SQUADRON RUN, New London to Newport—40 miles.

After remaining at anchor in New London harbor on Sunday, the squadron of the New York Y.C. continued the eastward journey. The Eastern Y.C. boats which reached New London Saturday afternoon augmented the fleet to unusual proportions.

The forty mile run from New London to Newport on Monday was a good one. There was a breeze of 10-knot strength blowing throughout the greater part of the struggle from the southeast. This gave the boats close and broad reaches to the finish off Brenton's Reef Lightship.

A fine lot of cruising craft took part in the run, and, with the cup boats, made an imposing spectacle. Several minor accidents occurred at the start of the smaller boats. Senta fouled Aspirant, sending her bowsprit into the mainsail of the new creation. Neola got into a bad position near the committee boat Rivera, caught her port preventer on the steam yacht's bowsprit, and carried away her topmast. She then withdrew and put back to New London. This left Weetamoe with no class competitor.

Constitution was in good form on the run and gave Reliance her second defeat on time allowance. The latest 90-footer led the fleet at the finish, but she was only 1m. 29s. on elapsed time ahead of the Belmont

craft. This was not enough to offset the allowance of over two minutes that Reliance has to give Constitution on a forty-mile course. Reliance beat Columbia 10m. 54s.

The harbor start was signalled at 8:30 o'clock from the flagship Delaware. The preparatory for the racers to get away was given at 9:45, and ten minutes later the first of the fleet started. The committee boat was anchored off Sarah's Ledge.

The preparatory whistle for the cup boats sounded at 10:15. Fifteen minutes elapsed before the start. Reliance went across at 10:30:36, Constitution at 10:30:51, and Columbia at 10:31:02. Shortly after the start the three 90-footers were on the port tack, with Reliance to windward and Constitution to leeward.

From the first Constitution did well, and with the favorable tide footed faster than Reliance. For the first few miles of the journey the wind was blowing not more than 6 miles an hour. At 11 o'clock Constitution had Reliance under her lee and the Iselin boat came about and stood to the eastward to avoid blanketing. They were then off Race Rock.

From Race Rock to Point Judith was 29 miles. The wind had backed east-southeast. This gave the two leading boats a close reach. Columbia was well under Fisher's Island shore and had to take several short tacks to make by. Fisher's Island was passed at 11:40. Watch Hill was abeam at 11:55. Constitution was still to weather of Reliance and Columbia in shore.

At this stage of the race the breeze went back again to the south-southeast, making eased sheets possible. It was freshening and the yachts moved fast. Reliance gradually drew to the fore. At 12:45 she was a fifth of a mile ahead of Constitution. Reliance passed the whistling buoy off Point Judith at 1:20:05. Constitution was timed at 1:21:33 and Columbia at 1:29:45.

The boats had a broad reach to the finish line seven miles away. Ballooners were set and forestaysails taken in. Going at great speed, Reliance flashed across the finish at 1:56:36. Constitution was timed at 1:58:20. Columbia ended the journey at 2:07:56. On elapsed time Reliance had beaten Constitution 1m. 29s. and Columbia 10m. 54s. The summary:

	Start.	Finish.	Elapsed.	
Reliance	10 30 36	1 56 36	3 26 00	
Constitution	10 30 51	1 58 20	3 27 29	
Columbia	10 31 02	2 07 46	3 36 54	

In the other regular classes the schooners Hildegarde, Ingomar, Elmina and Valmore, and the sloops Weetamoe, Queen Mab and Mira won. The yawl Vigilant scored a sailover. The winners in the special classes were the schooners Emerald and Latona and the sloop Aspirant. The summary:

TUESDAY, JULY 21—SQUADRON RUN.

Newport to Vineyard Haven—37 Miles.

The run to Vineyard Haven, which is usually an enjoyable one, was made a flat failure by the failing wind and a thick fog which drove in over the Sound at about 4 o'clock in the afternoon. It was agreed before the start of the cruise that no times should be taken after 8 o'clock at night. It was around 9 o'clock P. M. when Columbia, leader of the fleet, made in by West Chop to anchorage in the harbor.

Reliance finished somewhat later, and Constitution was towed in early in the morning. Many of the smaller racers put into Tarpaulin Cove for the night, while others turned about and headed for Newport.

The course was from Brenton's Reef Lightship to West Chop buoy, leaving Vineyard Sound Lightship to port and Lucan Shoal and Middle Ground to starboard. The start was made at 11:55. The wind at

that time was blowing about seven knots from the southeast. At 1:30 P. M. it had fallen to a dead calm.

The first of the fleet were sent away at 11:55 and the 90-footers were started at 12:30. Reliance slipped over to weather of Constitution, while Columbia had a good position unbothered by the others. Constitution, finding herself to leeward of Reliance, bore off and took the two minutes' handicap before getting away.

When the breeze first left the boats, Reliance was half a mile ahead and to windward of Constitution. Columbia was abreast of Reliance, but nearly a mile to leeward.

The breeze, which was south-southeast at the start, returned after a long wait from the eastward, bringing with it a thick fog, which made navigating hazardous. Columbia got a favorable slant of wind, which went by Reliance and Constitution, and was able to turn Vineyard Sound Lightship at 5:01:30, some twenty minutes before Reliance. The yawl Vigilant was next to Columbia in rounding the lightship. Reliance and Constitution were headed by the breeze before they made the mark and came down on it close hauled.

For a short time after turning the 90-footers had a chance to carry spinnakers to port, as the wind hauled into the westward for a brief spell. It finally went into the east, however, making a beat up the Sound between the islands to the finish.

WEDNESDAY, JULY 23—SQUADRON RUN, Vineyard Haven to Newport—37 Miles.

When the steam yacht Riviera made the line on Wednesday morning for the start of the run back to Newport from the eastern terminus, fifteen boats of all classes were ready for the gun. This was a greater number than many thought would report, considering the conditions of the night before.

The hoodoo encountered on Tuesday was again hovering over the cup boats. Shortly after the start Reliance was forced down on Middle Ground shoal by the strong tide running to the westward. The Iselin boat stuck her fin in the soft sand and hung there for at least two minutes. Headsails were slackened and her boom gybed over. She finally came off and proceeded westward.

Constitution, which was directly astern of Reliance, by quick maneuvering, avoided the shoal. Columbia however, was not so fortunate. The twice successful cup defender grounded hard and fast. The tender Park City came to her assistance and also got stuck. The launch Vanish, of the Columbia fleet, could make no headway in getting the yacht off. Finally the tug Storm King ran out a hawser, and by dint of much tugging Columbia was once more set free. Park City was not clear for an hour.

Constitution was not to go absolutely free from mishaps. At noon time, just as she passed out from under the lee of the clay cliffs of Gay Head, a vicious puff struck her. The topmast spreader gave way and crack went the topmast to leeward. It was the second topmast the Belmont boat had lost this season. As on the first occasion, after the wreckage was cleared away, Constitution proceeded under her own canvas. She eventually crossed the finish line.

The preparatory signal for the run was made at 9:45, and ten minutes later the first of cruising fleet was sent away. The start for the cup boats was at 10:30. Reliance crossed at 10:31:24 and Constitution at 10:31:46. Columbia was handicapped 15 seconds, crossing at 10:32:15. The wind was from the east and light.

Constitution took the lead from Reliance six minutes after the start, when the new boat ran on the shoal. In the light wind the Iselin boat went to the fore again. At Lucan Shoal buoy, nine miles from the start, Reliance was timed at 11:29:25 and Constitution at 11:30:55. Reliance passed Gay Head at 11:55. She was then about a quarter of a mile ahead of Constitution. Five minutes later the latter lost her topmast. The latest Herreshoff boat continued on alone.

A good breeze was stirring after 12 o'clock and it sent the racers toward Newport at a merry clip. Reliance was the first of the squadron to cross the finish line off Brenton's Reef. She finished at 2:03:06. The former cup defender, Vigilant, was second boat to end the race. The summary of the 90-footers:

	Start.	Finish.	Elapsed.
Reliance	10 31 24	2 03 06	3 31 42
Constitution	10 31 46	2 46 26	4 14 40
Columbia	10 32 00	Did not finish.	

Weetamoc went up into Class G for boats in cruising trim, tried conclusions with Vigilant on time allowance and was victorious. Ingomar finished some distance ahead of Emerald and Ariel in Schooner class B and won. In Class C for schooners Katrina beat Elmina on corrected time. Aspirant beat Effort and Challenge. Valmore scored a sailover. The summary:

Schooners—Class B.			
	Start.	Finish.	Elapsed.

Astor Cup Races.

NEWPORT, R. I.,
Thursday, July 23.

All Newport was out to see the annual struggle on Thursday for the cups given by Col. John Jacob Astor. A trophy valued at \$1,000 was offered for the winning schooner, all sailing in one class on time allowance. A cup going to sloops and yawls under like conditions was valued at \$500. The day was an ideal one. There was a fresh wind blowing from the southwest and some sea running. Newport harbor was astir early. Many parties were entertained on the steam and sailing

yachts of the squadron, and the scene at the start was an animated one.

The rule of measurement of the New York Y.C. places a draft limit on boats of all types. The cup craft exceeded the limit allowed and were not eligible to compete for the Astor Cups. The club, however, offered a special trophy for the 90-footers.

Constitution did not get her new topmast in place in time for the start. She arrived in the harbor later in the day. Reliance had no difficulty in defeating Columbia by 18m. 45s. over the 38-mile course and won the special trophy. F. F. Brewster's schooner Elmina repeated her performance of 1902 and won the Astor cup for schooners, while Fred M. Hoyt's Iselde probably got the trophy for sloops. It will not be definitely known until Vigilant is measured. It is figured, however, that Iselde won the cup by a fair margin.

The committee boat Riviera was at the line off Brenton's Reef Lightship in good season for the start at 11 o'clock. The Block Island course was signalled, which was 13½ miles S.W. 1-8 W., then 18 miles N.E. by E. 3-4 E. and 6½ miles W. by N. 1-8 N., thirty-eight miles in all.

At 11 o'clock the preparatory was sounded, and at 11:10 the sloops were sent away. Neola was first over, followed by the yawl Vigilant. The boats had a beat to windward for the first 13½-mile leg. The schooners were sent away at 11:15. Elmina was first over the line, closely followed by Ingomar. Captain Hank Haff sailed Ariel.

The signal for the 90-footers was sounded at 11:45. Both Reliance and Columbia crossed after the handicap gun, which was fired at 11:47. Reliance went over at 11:49:10 and Columbia at 11:49:49. For the first quarter of an hour Columbia held Reliance well, but after that the new boat slowly drew away. Although there was quite a sea bothering the racers, good times to the first mark were made. Times at the turn follow:

Vigilant	1 31 26	Columbia	1 35 55
Reliance	1 31 34	Senta	1 35 55
Weetamoc	1 32 36	Elmina	1 45 05
Iselde	1 33 25	Ariel	1 48 55
Ingomar	1 34 06		

In the 13½ miles Reliance had gained 5m. on Columbia. Vigilant beat Iselde 9m. 20s., Neola 11m. 56s., and Weetamoc 13m. 56s. Ingomar had beaten Elmina 11m. 20s. and Ariel 13m. 30s.

The next leg was a run of 18 miles. Spinnakers were set to starboard. Reliance, with her big bellying sail drawing well and boom at times dipping the water, gradually drew up on Vigilant. Just before reaching the second mark Reliance took the lead. This was at 3 o'clock.

As the first of the fleet was rounding the second mark a fog came in with a change of wind to the westward. Reliance rounded at 3:08, followed closely by Vigilant. The other boats could not be distinguished.

It was a close reach home. The tide set the boats to the leeward and a short hitch was necessary to make the line off the lightship. Reliance finished at 4:03:49, Vigilant at 4:06:20, and Columbia at 4:22:38. Neola headed her sister ship Weetamoc. The little sloop Iselde did remarkably well, finishing before many of the larger boats. The summary:

Sloops—Class G.			
	Start.	Finish.	Elapsed.
*Reliance	11 47 00	3 50 49	4 03 49
*Columbia	11 47 00	4 09 38	4 22 38

Effort	11 10 24	5 16 48	6 06 24

* Handicapped.

Lysistrata Cup Race.

NEWPORT, R. I.,
Friday, July 24.

The initial event for the Lysistrata Cup for steam yachts, offered by James Gordon Bennett, was held on Friday afternoon. Two starters came to the line. The race was won by H. H. Rogers' Kanawha, which defeated W. B. Leed's Noma over a course of 60 nautical miles by 4m. 56s. As a special incentive for the first race \$2,500 were added. The trophy is subject to challenge at six months' notice.

Although there were but two yachts in the race it was interesting from the start because of its novel nature and the data afforded. The speed of Kanawha was excellent. She averaged 19.65 knots over the whole course. Noma averaged 19.14. At the finish Kanawha was about a mile and a half ahead of Noma.

When the two came to the line off Brenton's Reef Lightship shortly before 2 o'clock P. M. they were in the finest condition for the contest. Engines had been overhauled, special coal procured, and everything done to insure the greatest possible speed. The regatta committee of the New York Y.C. was on board the torpedo boat destroyer Barry, offered for the occasion by the United States Government.

The starting line was two and one-half miles east-southeast from the lightship. The course led 15 miles east-southeast to Vineyard Sound Lightship, thence twenty miles south-southwest to a club mark. The last leg was twenty-five miles north by west one-half west to the finish off the lightship.

The starting gun was sounded at 2 o'clock P. M. Kanawha crossed at 2:02:36 and Noma at 2:02:46. Kanawha slowly drew ahead. The lightship marking the end of the first 15-mile leg was passed by Kanawha at 2:48:27. Noma was timed at 2:50:23, 1m. 55s. astern of her rival. Kanawha had covered the fifteen miles in 45 minutes and 51 seconds. Her average speed was 19.90 knots.

Kanawha continued to gain on the next twenty-mile leg. She turned the mark at 3:46:37. Noma rounded at 3:50:41. Kanawha had beaten her 2m. 8s. on the leg and steamed at the rate of 20.62 knots an hour, covering the twenty miles in 58m. 10s.

The last leg to the finish was twenty-five miles in length. Kanawha having the race well in hand, reduced her speed, part of the time sailing under natural draught. Just before the finish, however, the winning boat was given a burst of speed which made her fairly tear across the line. She was timed at 5:05:45. Noma finished at 5:10:51. On the last leg Kanawha averaged 19.39 knots and gained 1m. 2s. The summary:

	Start.	Finish.	Elapsed.
Kanawha	2 02 36	5 05 45	3 03 09
Noma	2 02 46	5 10 51	3 07 05

Gig and Launch Races.

In the morning the annual gig and launch races for the Owl and Gamecock colors and money prizes were held under the management of Fleet Captain C. L. F. Robinson. Charles D. Mower, measurer, was timer. Two entries came to the line for the Gamecock colors, a four-oared gig from the schooner Katrina and one from Crusader II. Katrina won by six lengths. The start was 11:15.

A lack of entries prevented a race for the Owl colors. Whaleboats from the cup craft raced for an eight-oared boat prize. Reliance won from Columbia by two lengths. The coxswain of the Constitution crew was knocked overboard and the boat withdrew. Columbia won the dinghy race from representatives of the schooners Katrina, Corona, the steam yacht Hauoli and the sloop Mira.

The launches raced over a mile and a half course. The boat from ex-Commodore Lewis Cass Ledyard's steam yacht Rambler (ex-Dreamer) won both events. The summary:

Launches—Class A.			
	Start.	Finish.	Elapsed.
Rambler	11 55 15	12 06 40	0 11 25
Intrepid	11 55 34	12 07 05	0 11 31
Coronto	11 55 31	12 08 06	0 12 35
Delaware	11 55 30	12 08	0 12 37
Surf	11 55 22	12 08 20	0 12 58
Launches—Class B.			
	Start.	Finish.	Elapsed.

Duquesne	12 07 00	12 23 10	0 16 10
Narada	12 07 00	12 24 12	0 17 12

Illumination.

In the evening the annual illumination of the fleet occurred. The boats in the harbor and various places along the water front joined in making the spectacle one like fairyland. This was the last official ceremony before the disbandment of the crews on Saturday.

The Canada's Cup Defender.

TORONTO, July 25.—Just to make it interesting the Royal Canadian Y. C. has arranged a series of five races for a valuable trophy. While these are not trial races for the selection of a defender, they will be for the benefit of the boat that is to defend the Canada's cup. They will put more interest into practice sailing and give the crew of the defender plenty of training.

Some very good work has been put in aboard Strathcona this week in races around Toronto Island, starting from the R. C. Y. C. town club. This course possesses so many angles that it offers great opportunities for seamanship. Roughly speaking, you steer southeast to the Eastern Gap, then south and by east for half a mile through the piers, then southwest along the island shore, north up the sandbar to the Western Gap, then east again down the bay to the finish.

On Monday Strathcona had an adventure which would have given the space killers of New York yards of material had one of the Shamrocks been in the place of the Canada's cup defender. Commodore Jarvis was in charge of Strathcona, and had started for the usual race around Toronto Island with the slippery Merrythought. The latter was being sailed by the crew of professionals in the Commodore's pay. The two crossed the starting line a length apart, Merrythought leading. They were swinging everything except their largest clup topsails, with balloon canvas forward. No. 2 club topsails were carried because the weather looked dirty.

It was a beam breeze to the Eastern Gap, and under the southwest puffs the yachts staggered along at a fast clip. In the middle of the bay Merrythought had a lead of two lengths; but every puff helped Strathcona, and she was up in her old place, just a length astern and a trifle to windward; when the racers fetched the pier head.

Merrythought was kept away a trifle to clear the corner, when suddenly her stern rose and she pitched violently forward, stopping dead. "Aground!" shouted her skipper. Commodore Jarvis shoved Strathcona's tiller hard up and she swung across Merrythought's stern into the deep water of the channel. She missed Merrythought by a plentiful margin, but it is not pleasant to contemplate the possible results if her skipper had not been quick enough. There would have been some kindling wood had Strathcona, sailing eight or ten miles an hour, fetched up on the stationary Merrythought.

The grounding prevented any further racing that day. It was some time before Merrythought was floated. Strathcona sailed out into the lake, but returned to the harbor to dodge a squall. Skipper Jarvis gave his crew plenty of practice in sail handling, taking off the club topsail and setting it again twice. Everything was done completely, even to looping up the sail cover. The spinnaker was also set twice, once in stops and once flying, and practice was given in changing from balloon to working headsails.

An attempt was made at a race the following day, but with no more success. After a fierce squall with hail, rain and lightning, a bit of a gale that blew boats over at their moorings, Strathcona and Merrythought started off in a faint trickle of air from the southeast. It was a beat all the way to the Gap, and Strathcona, starting fifty seconds ahead, had a lead of three minutes or more when she reached the lake. Then it was Merrythought's turn to do things. Inch by inch she crept up on Strathcona, passing her with a little burst of speed and stretching ahead rapidly. Soon she was a quarter of a mile ahead, but the yachts were not traveling nearly fast enough to cover a cup course within the time limit. Although Merrythought's lead did not exceed a quarter of a mile, Strathcona was nine minutes behind her in time. The

race was abandoned at six o'clock, with half the course left uncovered after two hours of sailing. Mr. J. Wilton Morse handled Merrythought on this occasion, and Mr. Jarvis sailed Strathcona.

On Wednesday, July 22, Strathcona sailed an excellent race, satisfactory from the point of view of the owner, the skipper, and the spectator. The contest afforded splendid opportunities for gear testing, as it was sailed in a fresh northerly wind which at times buried lee decks.

Strathcona had two competitors in this race, Canada, the original winner of the cup, and Merrythought, her usual trial boat. The course was the usual round-the-island affair. Canada and Merrythought had plenty of canvas aloft with their working topsails, but Strathcona swung her largest club. The three went over the line in a bunch, but Strathcona was not in a very good position. It was a broad reach to the Eastern Gap, and she had Canada to windward to bother her, with Merrythought close on the lee beam. The yachts sailed for a mile without altering positions, but in turning into the channel Strathcona stretched ahead a little and fled through like a deer with wolves at its flanks. The gybe in the channel was a nervy piece of business with the three so close, but it was accomplished without mishap, although there were a couple of wild sheers at the pier heads.

The gybe gave Merrythought a weather berth, and she was two lengths ahead by the time Strathcona's sheets had been trimmed for the beam breeze. Canada was just astern, and edged up until her horn once swung over Strathcona's weather quarter. The new boat was again in an awkward place, but did well, and would have dropped her competitors but for an accident. The turns of the weather topmast backstay surged on the cleat and the topmast was left unsupported. The big jib topsail slatted wildly, and finally tore out its clew and had to be dowsed. The topmast meantime stood the strain of the club topsail nobly and came back straight as a rush when the backstay was again set up. The yard of the topsail sets in a cup in the mainmast head at the cap, and thus the strain on the topmast is somewhat relieved. The testing in this instance gives rise to plenty of confidence in the stick.

Minus her jib topsail Strathcona just held her own, but when the others also dowsed theirs and hauled on the wind for the thresh in to the Western Gap, she shot ahead like an arrow. Outpointing and outfooting her contestants, she rapidly widened the water between herself and them. Merrythought and Canada had a battle royal, but it was for second place only. Strathcona sailed three feet to their two, and entered the harbor with a splendid lead. Fetching the wind abeam again she once more set a balloon staysail and a smaller jib topsail, and tore across the line a winner by over four minutes. The actual time was:

	Start.	Finish.	Elapsed.
Canada	4 21 06	5 24 26	1 03 20
Strathcona	4 21 08	5 20 00	0 58 52
Merrythought	4 21 18	5 25 06	1 03 48

After the race Mr. Jarvis gave his crew spinnaker drill, leaving the yacht at her island moorings for the night.

The following day, Thursday, the wind was about four miles an hour lighter, but still blew strong from the old quarter, fifteen miles an hour or so. Merrythought was Strathcona's only competitor this day, and the race, while useful as a gear-testing and crew-drilling opportunity, was less valuable as an accurate measurement of the new boat's capabilities, from a number of circumstances.

The two made a splendid start, crossing the line instantaneously, with Strathcona to windward. There was plenty of room for both, and no attempt at blanketing. They ran for the Eastern Gap on even terms, but when they gybed over, Merrythought lost her jib topsail sheet. The big kite blew out ahead of her wildly, and she had to be rounded up before it could be controlled. By this time Strathcona had a lead of fully a quarter of a mile.

This meant a procession rather than a race, so Strathcona rounded up outside and waited for Merrythought. In the lake they were again on an even footing, but as Merrythought was towing a dinghy the equality could not last long. When the two passed the can buoy for the beat up the western sandbar, Strathcona had a lead of forty-five seconds. This she rapidly increased in the thresh, gaining nearly four minutes in a mile and a half. Both boats came down the bay at a furious pace, but Merrythought was too far astern to make the finish exciting. Summary:

	Start.	Finish.	Elapsed.
Strathcona	4 21 00	5 23 10	1 02 10
Merrythought	4 21 00	5 28 48	1 07 48

Spinnaker setting and sail handling drill followed on Strathcona after the race. CHARLES H. SNIDER.

Marine and Field Club.

BATH BEACH, L. I.,
Saturday, July 25.

THE fourth regatta of the Yacht Racing Association of Gravesend Bay was held on the afternoon of Saturday, July 25, under the auspices of the Marine and Field Club. It was sailed in a light fluky wind which hovered between south and west and was never more than a 7 knot velocity. Eighteen craft started, all but two of which finished. The winners were Bobtail, Vagabond, Spots, Apukwa II., Martha M., and Esperance. Bonito scored a sail over.

The struggle of the day was that between the class P boats Vagabond and Ogeemah. In the light breeze first one would lead and then the other. Vagabond finally won by 4m. 21s. Apukwa II. sailed a good race in class R, as did Esperance in the Marine and Field one-design division.

Boats in classes M and N twice covered a triangular course. They had close hauled work to Red Can buoy No. 2 off Coney Island Point, a reach from there to Craven Shoal buoy and a broad reach home to the start off the Marine and Field Club.

The other craft had a close reach to the mark off the Brooklyn Y. C., windward hitches to the stakeboat off Sea Gate, a broad reach to the mark off Fort Hamilton, and another reach home. This course was also covered twice. A shift of wind toward the southward, during the second round of the course, allowed the smaller boats to carry spinnakers from the stakeboat off Sea Gate to the Fort Hamilton mark. A strong flood tide was running throughout the event, which, in the light air, bothered the boats considerably.

The 30-footer, Bobtail, was pitted against boats of less modern type and had little difficulty in winning. Vagabond beat Ogeemah 4m. 21s., Karma 5m. 7s. Martha M. beat Rascal 2m. 57s., Boozie 8m. 35s. Apukwa II. beat Sandpiper 9m. 54s. Esperance beat Jig-a-Jig 8m. 23s., Stinger 21m. 5s., Kelpie 29m. 3s. Squaw and Spots did not finish.

The fifth regatta of the Yacht Racing Association of Gravesend Bay will take place on the afternoon of Saturday, August 1, under the auspices of the Brooklyn Y. C. The summary:

Sloops—Class M—Special—Start, 3:18.			
	Finish.	Elapsed.	
Bonito, Haviland Brothers.....	6 23 22	3 05 22

Eastern Y. C.

NEWPORT, R. I.,
Saturday, July 25.

The last event immediately connected with the cruise of 1903 took place on Saturday when the Eastern Y. C., which joined the fleet at New London, gave a complimentary regatta to the New York Y. C. The contest was open to boats of both organizations.

A fresh breeze from the southwest blew throughout the race and made the struggle a spirited one. Several accidents were recorded. Columbia, just after rounding the second mark of the 30-mile triangular course, carried away her topmast and withdrew from the contest, being towed to harbor by her tender, Park City.

Reliance, after the race was over, when about to make her moorings in the harbor, had a mishap by which her hollow steel gaff buckled upward at a point ten feet from the jaws. The sloop Isolt, which was off Brenton's Reef Lightship before the regatta begun, carried away her mast. Thirteen craft started and finished the contest. In the minds of many a sailor this number accounts for the series of accidents.

It was the last trying out contest for the Cup boats before the official trial races. Reliance, as if to give a master touch to her record, defeated Constitution 6m. 18s. over the 30-mile triangle. There was a smooth sea and the friends of the Belmont boat had looked for her to do better. Reliance received a beautiful cup for the 90-footers, presented by ex-Commodore A. S. Bigelow, of the Eastern Y. C.

Morton F. Plant's new Herreshoff schooner, Ingomar, was a winner in class B, and also captured a trophy for schooners offered by Commodore Bigelow. Rondina was a winner on corrected time in schooner class E. Neola scored a victory in sloop class H. Weetamoe withdrew. Isolde had no competitor in class I, but covered the course and won the cup offered by Commodore Bigelow for sloops, on corrected time, all sailing in one class. In class J, Cossack is the probable winner. This cannot be definitely settled, however, until Katonah is measured.

The regatta committee of the Eastern Y. C. was on the tug Storm King. Course signals were sent aloft at 11 o'clock. They gave the boats a beat on the first ten-mile leg, a run on the second ten miles, and close reach home. Schooners in class E and class J sloops sailed a 21-mile course.

Contrary to custom of late, the 90-footers were sent away first. The starting gun was fired at 11:40. Reliance crossed the line to windward at 11:40:18, Columbia at 11:41:57, and Constitution at 11:42:18, handicapped 18s. The schooners and sloops were started after the Cup boats.

Reliance pulled away from the others in the early stages of the contest, and interest soon centered in the fight between Columbia and Constitution for second place. The old boat did remarkably well, and the battle became intensely interesting as they neared the first mark.

Reliance rounded at 12:55:05. Columbia headed Constitution and turned at 12:58:25; Constitution rounded at 12:59:26. In the ten miles of windward work Reliance beat Columbia 1m. 41s. and Constitution 2m. 39s.

Reliance and Columbia set spinnakers to starboard and broke out balloons. Constitution held on to a lone balloon for a time in hopes of getting to windward of Columbia's wake. She afterward broke out a spinnaker.

Rounding the second mark each craft took in the kites and gybed booms to starboard for the close reach to the finish. Columbia made a wide turn and allowed Constitution to slip in between herself and the mark. Just after Columbia had gybed, her topmast went by the board to leeward, and she withdrew. Some one had forgotten to set up the port topmast back stay.

Reliance was timed at 1:50:33, Columbia at 1:57:11, and Constitution at 1:57:30. In the 10-mile run Reliance had gained 2m. 36s. on Constitution and 3m. 18s. on Columbia.

On the last leg the wind freshened to 15 knot strength. Jib topsails were not carried. With sails drawing well both boats slipped through the sea at a wonderful speed. Reliance finished at 2:39:10 and Constitution at 2:47:10. On the reach Reliance had beaten Constitution 1m. 3s., making a victory of 6m. 18s. over the entire course. The summary:

Sloops—Class G.			
	Start.	Finish.	Elapsed.
Reliance	11 40 18	2 39 10	2 58 52
Constitution	11 42 00	2 47 10	3 05 10
Columbia	11 41 57	Disabled.	

Schooners—Class B.				
Ingomar	11 46 25	3 17 49	3 31 24	3 31 24
Chanticleer	11 47 00	3 44 06	3 57 06	3 57 06

Katonah	11 55 31	3 24 00	3 28 29	3 28 29
Isolt	Disabled.			

Sippican Y. C.

MARION, MASS.,
Saturday, July 25.

An open race of the Sippican Y. C. was sailed on Saturday, July 25, in a rattling southwest breeze. The larger yachts were single reefed, while the smaller ones carried doubles. The young women who sail 15-footers had their hands full, but they all brought their boats through without accident. In the 21ft. class, Edith was the only yacht to sail the right course. In class B, cats, Kingfisher, while leading, was dismasted, and Laura, which was a good second, towed the disabled yacht in, although Laura was sure of first prize, thus making no race. In class D, cats, Sergius and Krieker sailed a close race, Sergius crossing the finish line 3 seconds ahead. She was protested for fouling a mark, and was disqualified, thus giving the race to Krieker. In the 15ft. class, Spider won easily. No. 4 won in the Burgess one-design class, Blue Jay in the 15ft. class, and Ariana in class H. The summary:

Herreshoff 21ft. Knockabouts.			
	Finish.	Elapsed.	
Edith, Clark King.....	3 21 38	2 18 36	
Quakeress, W. F. Harrison.....	Sailed wrong course.

Cohasset Y. C.

COHASSET, MASS.,
Saturday, July 25.

The closest race of the season in the Cohasset Y. C. was sailed Saturday, July 25, in a puffy southwest breeze. In the 21ft. knockabouts Remora won by 59 seconds. Fly beat Fancy in the special class, both yachts being under the same ownership. In the 18ft. knockabouts, Result won from Uncas by only 15 seconds. In the handicap class, Selma finished ahead of Undine in a closely contested race, but Undine took first place on corrected time. The summary:

21ft. Knockabouts.			
	Elapsed.		
Remora, G. G. Crocker, Jr.....	1 40 38		
Herelda, Alanson Bigelow, Jr.....	1 41 37		
Delta, Ralph B. Williams.....	1 41 55		
Eleanor, F. G. Moors.....	1 43 10

Beverly Y. C.

NEW BEDFORD, MASS.,
Saturday, July 25.

In a recfng breeze from the southwest, four of the Buzzard's Bay one-design 30-footers of the Beverly Y. C. cruised to New Bedford on Saturday, July 25, and raced off the South Dartmouth station of the New Bedford Y. C. Mashnee took the lead at the start and held it all around the course. There was an interesting race in the 15ft. class, between three of the new one-design boats from the board of Mr. W. H. Hand, Jr., and Catspaw, of the Herreshoff one-design 15-footers. All carried single reefs and had all the sail they could lug. Chubby II. took in so much water that she sank, and Lora, being full of water, withdrew. Dart and Catspaw went over the course, Dart winning out by 3m. 30s. The summary:

Special Class—One-Design 30-footers.			
	Elapsed.		
Mashnee, R. W. Emmons, 2d.....	2 05 45		
Arabian, Robert Winsor.....	2 08 08		
Young Miss, D. L. Whittemore.....	2 11 40		
Gamecock, Louis Bacon	2 12 40		
15-footers.			
Dart, F. H. Stone, Jr.....	1 55 25		
Catspaw, S. D. Warren.....	1 58 55		
Lora, J. F. Knowles, Jr.....	Withdrew.		
Chubby II., L. Grinnell.....	Disabled.		

Shamrock Trials.

SANDY HOOK, N. J.,
Monday, July 20.

Shamrocks I. and III. sailed a 30-mile windward and leeward race on Monday, July 20, in which the challenger made fast time, covering the whole distance in 2h. 56m. 26s. On the run home her jib topsail sheet parted, allowing the old boat to pick up. The summary:

	Start.	Finish.	Elapsed.
Shamrock III.	11 15 20	2 14 40	2 59 20
Shamrock I.	11 15 28	2 16 10	3 00 42

Tuesday, July 21.

In a very light breeze Shamrock III. gave the first Lipton challenger a bad drubbing in a twenty-mile leeward and windward course on Tuesday. It was the original intention to send the boats twice over the course, twice making a total distance of 40 miles. This was abandoned because of the light wind. Shamrock III. led Shamrock I. by nearly four miles. The summary:

	Start.	Finish.	Elapsed.
Shamrock III.	11 43 07	2 11 45	2 28 38
Shamrock I.	11 42 35	2 44 30	3 01 55

Shamrock III. won by 33m. 17s.

Wednesday, July 22.

In the trial of Wednesday which was started in a fine breeze and somewhat of a sea, Shamrock III. suffered an accident to her gaff by which the hollow steel spar buckled about ten feet from the jaws. It was the original intention to sail a 30-mile windward and leeward course. At the end of the windward work the challenger led the first Shamrock. She covered the distance in 1h. 24m. 20s.

Thursday, July 23.

A windward and leeward course was sailed on Thursday in which Shamrock I. gained her first victory over the challenger. The distance was 30 miles and the first Lipton 90-footer won by 5m. 25s. Shamrock I. had all the luck in the light wind that blew. The summary:

	Start.	Finish.	Elapsed.
Shamrock I.	12 53 00	4 27 15	3 34 15
Shamrock III.	12 50 00	4 29 40	3 39 40

Friday, July 24.

The challenger appeared to be in fine form on Friday. A 20-mile leeward and windward journey was first taken, in which she showed superiority on all points of sailing. The same result prevailed in an 8-mile reach between Scotland and Sandy Hook Lightships just before going to moorings in Sandy Hook Bay.

Saturday, July 25.

The Lipton boats were out Saturday morning in a light wind. The challenger had no difficulty in sailing away from the old boat. The wind fell flat, however, after six miles of the course had been sailed. The trial was abandoned and the yachts taken in tow for Erie Basin, where they were hauled out late the same afternoon. The underbodies of both boats were to be cleaned and polished. Shamrock III. was to have a new bowsprit put in place, somewhat longer than the one which has been used in the trials thus far.

Winthrop Y. C.

WINTHROP, MASS.,
Saturday, July 25.

The handicap race of the Winthrop Y. C. was sailed off the club house Saturday, July 25, in a strong southwest breeze. In the 25ft. class, Calypso led easily all over the course, with Thordis second, but Helen won on time allowance. L'Aiglon and Kit, in this class, were both dismantled. In the 18ft. class, Zetes II. easily led over the course. Effie won by a long margin in the 15ft. class. Harriet finished alone in the 21-footers. The summary:

25ft. Class.			
	Elapsed.	Corrected.	
Helen, C. A. Young	1 20 57	1 02 57

Shelter Island Y. C.

SHELTER ISLAND, L. I.,
Saturday, July 25.

The Shelter Island Y. C. held races for sloops in classes N, R, and sub-classes R, on the afternoon of Saturday, July 25. Oscar B. Weber's new Crowninshield 30-footer, Woglinda, won in class N, her only competitor, Oiseau, going aground. Harp won in class R, and Ria in sub-class R. The summary:

Sloops—Class N—Start, 2:10.			
	Finish.	Elapsed.	Corrected.
Woglinda, Oscar Weber	4 23 22	2 13 22	...
Oiseau, Harry S. Maxwell	Disabled.

Eelskin, T. L. Hutchinson	4 44 42	2 29 42	2 22 17
Duchess, Carl Pickhart	4 47 57	2 32 57	2 30 35

Mr. Thomas A. St. Johnston, of New York, has recently sold for Mr. John B. Rhodes, of New Bedford, Mass., the sloop yacht Siesta to Mr. E. C. Dameron. Mr. Rhodes is now the owner of the 145ft. steam yacht Aria.

Boston Y. C.

HULL, MASS.,
Saturday, July 25.

A club race of the Boston Y. C. was sailed off the Hull club house on Saturday, July 25, in a stiff southwest breeze. Only one starter showed up in the 25ft. class, Chewink III., and she sailed over the course alone. In the 22ft. class, Opitsah V., was forced over the line too soon at the start, and Medric got away first. Medric led on the first round of the course, but on the second beat to windward Opitsah V. caught up with her and forced her to tack. Shortly after this Medric's throat halyards parted and she withdrew, leaving Opitsah V. to finish it out alone. There were nine starters in the 18ft. knockabout class, all going over the line in a bunch. They split tacks after the start, and Miss Modesty, holding to the shore, took the lead at the first mark and held it all over the course. In the first handicap class Kiuna got the start, but Jingo soon went into the lead and held it to the finish, but lost to Helen on corrected time. Widow had things all her own way in the second handicap class, finishing over ten minutes ahead of Clarice. The summary:

25-footers.			
Chewink, III., F. G. Macomber	1 57 57	Elapsed.	1 57 57

Newport 30-Footers.

NEWPORT, R. I.,
Monday, July 20.

Vaquero III., sailed by Harry Payne Whitney, won the sweepstakes for the 30-footers on Monday, July 20. There was a light breeze blowing. The yachts went twice over a course from Newport to Jamestown and return. Vaquero III. was never headed. The summary: Start 4:02.

	Finish.	Elapsed.
Vaquero III., H. P. Whitney	5 22 20	1 20 20
Barbara, W. Rutherford	5 23 10	1 21 10
Raccoon, J. R. Drexel	5 23 40	1 21 40
Carolina, C. L. Robinson	Disqualified.	

Thursday, July 23.

Barbara was sailed well in the race for the 30-footers on Thursday, and won handily, defeating Vaquero III. 2m. 4s. There was a strong southwest wind blowing. The summary: Start, 3:31.

	Finish.	Elapsed.
Barbara, W. Rutherford	4 52 35	1 21 14

Duxbury Y. C.

DUXBURY, MASS.,
Saturday, July 25.

A club race of the Duxbury Y. C. was sailed on Saturday, July 25, in a strong westerly breeze. In the 18ft. knockabouts there was a close race, the boats constantly changing positions. Kittiwake got the lead on the last leg, while Miladi and Aspinquid were luffing. Rooster finished first in the handicap class, but lost to As You Like It on allowance. The summary:

Annisquam Y. C.

ANNISQUAM, MASS.,
Saturday, July 25.

A race of one-design dories of the Annisquam Y. C. was sailed in Ipswich Bay, Saturday, July 25, in a stiff westerly breeze, with a jump of a sea. Little Un took the lead on the windward leg, but was closely pressed by Venus on the run back, finishing 6 seconds ahead. The summary:

	Elapsed.
Little Un, Donald Howes	1 17 23
Venus, Keith Pever	1 17 29
*Jessica, J. H. Finch	1 22 07
Sister, D. H. Woodbury	1 22 53
*Disqualified.	

Seawanhaka-Corinthian Y. C.

The Alfred Roosevelt memorial cup is offered this year for the raceabout class. The race will be held on Saturday, August 1, and the course will be posted in the club house one hour before the start, which will be at 3:20.

The Robert Center memorial cups will be offered for the following classes: Thirty-footers, raceabouts and fifteen-footers. The races will be held on Saturday, August 8, and the sailing directions will be posted in the club house and sent to all entries by Thursday, August 6. Entries will be received at the club house up to Saturday at 10:30.

RACE COMMITTEE.

Canoeing.**American Canoe Association.****Twenty-Fourth Annual Meet, Sugar Island, St. Lawrence River, August 7-21, 1903.**

YONKERS, N. Y., July 17.—To the Members of the American Canoe Association: The following circulars of the different committees will explain themselves. Members will see that the arrangements are about the same as previous years. As Sugar Island is in Canadian territory, we have arranged to take canoes, etc., into Canada as is explained in the following letter:

Customs Department, Canada.—Ottawa, July 14.—H. Lansing Quick, Esq., American Canoe Association, Yonkers, N. Y.: Sir—I have the honor to acknowledge the receipt of your letter of the 8th inst., stating that the international meet of your Association will take place this year at Sugar Island, near Gananoque, Aug. 7 to 21. In reply, I am to state that the canoes, tents and outfits sent in bond to Gananoque, or arriving at that port direct, may be permitted to be used there, upon report inwards, without payment of duty, conditional on exportation within thirty days. Duty is to be paid on all articles consumed or which are not exported as aforesaid. A copy of this letter is being sent to the Collector of Customs at Gananoque, for his guidance in the matter.

I have the honor to be, sir, your obedient servant,

JOHN McDUGAL,
Commissioner of Customs.

Transportation.

The Trunk Line Association, New England Passenger Association, the Grand Trunk Railway System, the Canadian Pacific Railway, and the Richelieu & Ontario Navigation Company have granted the customary concessions, viz.: A round trip of one and one-third fare to Clayton and Gananoque. Members will pay full fare to the points named, obtaining from the selling agents certificates which, when indorsed and vided at camp, will enable the holders thereof to return to the point of starting by continuous passage at one-third of the regular rate. Tickets may be purchased three days prior to and during the first three days of camp, and certificates will be honored for return trip (without stop-over) for three days (Sundays excepted) after the close of camp, Aug. 21.

All certificates must be indorsed by the secretary-treasurer and the special agent of the Trunk Line Association.

The special agent of the Trunk Line Association will be at the camp to give certificates on the following dates: Aug. 11 and 12.

The Richelieu & Ontario Navigation Co. have granted the rate of one and one-third fare from all points on their line to Clayton. This rate will not apply on their weekly steamer Hamilton running between Hamilton and Montreal, and touching only at Canadian ports.

Members arriving at Gananoque or Clayton by rail via R. W. & O. R. R. (N. Y. C. & H. R. R. lessee) or by steamers of the R. & O. N. Co. (from Hamilton, Toronto, Kingston, Deseronto, Belleville, Brockville, Prescott, Montreal, Quebec and intermediate points) will find the steamer Valeria at the railroad dock, running on the following schedule:

Leave Gananoque.....6:30 A.M.	Arrive Sugar Island.. 6:45 A.M.
Leave Gananoque.....3:00 P.M.	Arrive Sugar Island.. 3:15 P.M.
Leave Clayton.....10:20 A.M.	Arrive Sugar Island..11:00 A.M.
Leave Clayton.....5:40 P.M.	Arrive Sugar Island.. 6:20 P.M.

The Valeria does not run on Sundays, but provision will be made to connect with trains on those days.

The rate on the steamer Valeria will be, from Clayton to Sugar Island and return, 75 cents per passenger, which includes one canoe and duffle. From Gananoque to Sugar Island and return, 75 cents per passenger, which includes one canoe and duffle.

Round trip tickets from either Gananoque or Clayton will be furnished by purser of steamer Valeria.

All canoes, duffle, baggage, freight or express matter should be prepaid and plainly marked: Clayton, N. Y.; or Gananoque, Ont., Canada, A. C. A. Camp, Sugar Island, via steamer Valeria.

Customs Regulations.—The same arrangements as have prevailed in former years have been made for canoes and duffle coming from the United States. Duty must be paid on provisions.

Any further particulars regarding transportation will be gladly given and the committee would be pleased to help clubs or members in securing favorable transportation from the railroads in regard to handling canoes and duffle.

The Transportation Committee: Wm. M. Carpenter, Chairman, Ossining, N. Y.; J. R. Robertson, Auburndale, Mass.; J. N. McKendrick, Galt, Ontario, Canada.

Camp Site.

To the Members of the American Canoe Association:

The meet this year will be one of the most important the Association has ever held, as it will be the first camp on Sugar Island, our new possession.

It will be easily seen that the work of the Camp Site Committee will be unusually difficult, for there must be something of permanency in what is done in the way of building this year. A dock must be built, a mess hall, if enough money can be raised, and the island prepared for a camp.

It is earnestly hoped that all those who come to camp will be as patient as possible during the building of their tent floors, moving of baggage, etc. Heretofore it has been possible to decide on a camp site for each man as he has applied, but on account of the large size of the island, it is impossible to tell beforehand where any one will prefer to locate.

The chairman of the Camp Site Committee, with Commodore Hyatt and different members of the committee, has already made two trips to Sugar Island, and on the last trip, three weeks ago, decided on the location of the camp. Each man has gone there with the determination to locate "headquarters" near the center of the island, and each one has come away with the decision that the eastern end of the island, while a beautiful place, will be too far away to use, too far to get to "headquarters" and mess, for there are rock bluffs to be climbed, and a long distance to be walked unless the trip is made by water; and in a wet day that will not be agreeable.

The row of headquarters tents will be on the west side of a long open space in front of a row of trees, and will be approached directly from the dock, which is now being built.

The mess hall will be on the south side of the large field. The field will be available for baseball and other sports, as desired.

The ladies' camp will be on the neck of the land at the western end of the island. It is a good place, with fine views.

The men's camp will be to the east on both sides of the island, as far as the members may find it convenient to locate.

Tents, tent floors, cots and mattresses, blankets and such conveniences will be rented as usual. It would assist the Camp Site Committee if those who know they are going to attend would notify the chairman beforehand what they will require in the way of camp equipment.

Every member of the Association who can possibly arrange their holidays for that date should make an effort to attend this meet. They should know what kind of an island they have an interest in for \$1 per year, and where they can camp at any time of year.

Nature has certainly favored Sugar Island. There are to be found upon it high bluffs, thick woods, open fields, beautiful bays and sand beaches. Islands small and large are near enough to make the views attractive, and the island is on the route of the large steamers.

There is good bass and pickerel fishing near by, and in spring and fall there is good duck shooting.

It is particularly hoped that many of the older members may be with us, and let the newer men become acquainted with them.

Whether you have attended a meet of the American Canoe Association or not, you will be assured of a welcome, and will be quite certain to have one of the pleasantest outings you have ever had. Yours very truly,

JOHN A. WRIGHT,

Chairman Camp Site Committee.

The mess this year promises to be one of the best the Association has ever had, as the commodore was fortunate enough to secure the services of a caterer who is especially qualified for running a mess at an A. C. A. meet.

The commodore has already gone up to the camp, and may be addressed at the Gananoque Inn, Gananoque, Can.

I would especially request the members to take their receipts for 1903 dues to camp with them, as they will not be allowed to register in camp unless they are in good standing in the Association.

Let every member try his best to attend this year's meet, as it will be the first held on the Association's own property, and we

would like every member to be able to see the island of which he is part owner.

The officers and committee are doing everything in their power to take the best of care of all who come.

H. LANSING QUICK, Sec'y-Treas.

Instructions to Members attending the Meet.

For the convenience of members of the Atlantic Division, a special transportation baggage car has been arranged for and will carry canoes and duffle free of expense to Clayton, N. Y., and return. The car will be at the Thirtieth Street Station of the New York Central & Hudson River Railroad, on Saturday, Aug. 1; at Manhattan Station, 130th street and Hudson River, Aug. 2, and Monday, Aug. 3; at Yonkers on Tuesday, Aug. 4, and Ossining, Wednesday, Aug. 5. Canoes and duffle may be loaded on the car at any of these points.

All canoes and packages should be plainly marked with the owner's name, care Wm. M. Carpenter, Transportation Car for Clayton, N. Y., A. C. A. camp. All freight and express charges must be prepaid to the car.

Arrangements have been made for sleeping car accommodations on train leaving Grand Central Station, New York city, for Clayton, Aug. 7, at 8 P. M. Application for berth, inclosing \$2, should be made to the chairman of the Transportation Committee not later than Monday, July 27, when sleeping car ticket will be mailed. Purchase regular railroad ticket at Grand Central Station ticket office, asking for "Trunk Line certificate" for A. C. A. camp so as to obtain the concession in fare returning.

Any further information will be cheerfully given as to the above on request to the Transportation Committee, Wm. M. Carpenter, Chairman, P. O. Box 194, New York city.

New York C. C.

BENSONHURST, L. I.

Saturday, July 25.

The New York Canoe Club held record sailing events on the afternoon of Saturday, July 25, for decked and open canoes. They were postponed on the Saturday before because of the storm. The winners were George MacTaggart and R. S. Foster. The summary:

Decked Canoes—Start, 3:25.

	Finish.	Elapsed.
G. W. McTaggart.....	4 32 40	1 07 40
H. Kenard	4 35 30	1 10 30

F. P. Land.....	5 53 20	2 18 20

A. C. A. Meet, Aug. 7-21.

BROOKLYN, N. Y., July 23.—*Editor Forest and Stream:* The twenty-fourth annual camp of the A. C. A. at Sugar Island, Thousand Islands, St. Lawrence River, will be held from August 7 to 21, 1903. The year-book of the Association and the customary "camp circular" have been unavoidably delayed, and this announcement may bring the camp to the notice of men who might otherwise overlook it. The names and addresses of the pursers of the respective divisions, to whom application should be made by intending members, are as follows:

Edward Muller, purser Atlantic Division, 9 North Moore street, New York.

J. S. Wright, purser Central Division, 333 West avenue, Rochester, N. Y.

O. C. Cunningham, purser Eastern Division, Medford, Mass.

G. A. Wright, purser Northern Division, Brockville, Canada.

A. W. Foote, purser Western Division, care Foote, Burt & Co., Cleveland, O.

J. K. HAND.

A. C. A. Membership.

The following have applied for membership to the A. C. A.:

Atlantic Division—F. M. Crispin, Paul McMichael. EDWARD MULLER, Purser.

138 FRONT STREET, New York, N. Y., July 21.—The following gentlemen have been elected members of the Atlantic Division of the A. C. A.: A. S. Gregg-Clarke, Ed Lemoine Somerville, Ralph C. Paxton, Frederick Leonard Adams, John Neilson, Elmer B. Ayres, Charles H. Parson, and A. W. Scott.

H. L. POLLARD,

Vice-Com: A. D., A. C. A.

MEDFORD, Mass., July 23.—The following application for membership to the A. C. A. has been received: S. Otis Ralston, Woburn, Mass.

O. C. CUNNINGHAM,

Purser E. Div. A. C. A.

Rifle Range and Gallery.

Fixtures.

Sept. 2-11.—Annual championship matches of the United States Revolver Association, as follows: Sea Girt, N. J.; Chicago, Ill.; Woburn, Mass.; St. Louis, Mo.; San Francisco, Cal. Open to all. For programmes address H. W. Ott, Box 162, New York city.

The Palma Trophy Contest.

The particular feature of the Palma match consisted in the fact that it had to be shot in with the national arm of the country the teams represent, "being in all respects of the pattern adopted and used to the troops for service." It would seem as though this rule may be interpreted in a very broad sense, for while all the teams except the United States used weapons of a strict service pattern, the members of the American team were armed with rifles which had been fitted with special barrels having a rifling making a complete turn in 8 inches, whereas this figure is 10 inches or the official service rifle. It is not for us to object to a deviation from the rules of the match, which has been allowed to pass without comment by the council of the National Rifle Association, but it is necessary to mention the circumstance in order to correct the impression that it was the United States service rifle which won the match. The service rifle was there bar the barrel, and it cannot be denied that this is an important part of a military weapon.

Sentiment had a good deal to do with the presence of the various teams that were represented on this occasion. The United States team were there because they wanted to win the match, interest in military rifle shooting in America needing some such impetus as this to restore a part of its lost popularity and to favor the movement with renewed life and vigor. The French team came over to learn something about conditions that were quite novel in their own country. Their distance for shooting is 300 metres, and for this purpose they use a cartridge which differs in bullet and other details from the ordinary Lebel. Of wind

allowance for extended distances, and the vital importance of studying the conditions of air and light, they know but little, and they hoped to derive instruction, even if they failed to make a good show against their more practiced competitors. The Norwegians came because they knew they could shoot. Admittedly they were unfamiliar with our long distances, but they held the view that the main idea was to shoot right on, and judge wind as they went by the rough and ready method of watching the flags and carefully noting the result of the last shot. So far had they carried the practice of shooting standing that they showed themselves in practice to make some remarkably fine hits at 800 yards from this position. It would be superfluous to give reasons why the English team wanted to win. By the lucky coincidence of a bad wind and exceptional capacity to judge it, they won last year's match, notwithstanding certain difficulties with the ammunition.

The leaders of the match rifle movement in this country are regarded as a body of experimentalists, who study ammunition in the light of its behavior at the ranges. They are supposed to be able to determine what is best for their purpose, and thereby act upon the emulative instincts of the manufacturer, spurring him to initiate improvements. Their united intelligence was not long in informing them that the .303 as a match rifle cartridge could be pronounced a failure. No one troubled to go much further than this, because the 6.5 mm. Mannlicher lay at hand, a ready-made combination of rifle and cartridge of the kind they wanted. The .303 thereupon lay in abeyance, and no one seemed quite sure why it was a failure. Following on last year's Bisley meeting, we made some lengthy remarks upon the subject, pointing out among other things that the feeble ballistics of our national cartridge made it incapable of maintaining a regular elevation at great ranges, a fault rendered the more apparent in the scoring by the long, flat form of the long-range target. Since then the target has been altered from 12 feet wide by 6 feet high to 10 feet by 6 feet, which still punishes faults of elevation more severely than faults of wind judgment. A square target would, of course, deal equally with the two forms of error. The change made does not, however, affect the Palma. The old sizes have been retained, as they are specified in the permanent conditions for that match.

Three months ago we were as far from a solution of the ammunition question as we were five years ago. Yet we find that in the recent Palma match of all the explanations put forward to account for the British team being beaten by fifteen points out of a total possible score of 1,800, no one has yet suggested inferiority of ammunition. Special ammunition was used, and its inception came about in this way: A firm of ammunition makers, whose name is hardly known to the public at all in connection with their staple manufacture, viz., .303 cartridges, were anxious to make the merits of their product known among rifle shots. The expert of this firm was present at the annual dinner of the Gun Makers' Association last April, as also was Mr. J. E. Martin, a well-known Glasgow gun maker, and both armorer and a shooting member of the British team who shot in the Palma match last year. Neither of these gentlemen was paired for the evening, and the present writer introduced them, suggesting that they should discuss the specifications for a suitable high-power cartridge for the coming match. In the conversation which ensued it was generally agreed that an increased powder charge was desirable. One of those present thought the bullet should be the same weight, another that it should be lighter, and a third that it should be heavier. Experiments followed, and the new Palma .303 cartridge was the outcome. The council of the N. R. A. authorized it for all the match rifle contests during the coming meeting, but users of the Mannlicher opposed it, as the bullet was heavier than 217 grains, the maximum specified in the regulations for ammunition, and the protest had to be allowed, notwithstanding the disappointment of many who desired to give it a trial with match sights.

The King's Norton Metal Company, who are the manufacturers of the new long-range cartridge, have supplied us with the following details, showing their records at proof. Observed velocities over 60 yards: 1, 2,027; 2, 2,038; 3, 2,027; 4, 2,015; 5, 2,022; mean 2,026 feet per second; deviation, 5.8. Second series of shots: 1, 2,025; 2, 2,028; 3, 2,020; 4, 2,018; 5, 2,022; mean 2,023 feet per second; deviation, 3.2. The same cartridges in another rifle gave: 1, 2,018; 2, 2,006; 3, 2,016; 4, 2,024; 5, 2,010; mean 2,014 feet per second; deviation 5.6. The temperature was 80 degrees F., which accounts for about 15 feet above the normal readings. The explosive charge of a cartridge that was examined consisted of 34.4 grains of cordite and the bullet weighed 225 grains.

The American team, who won the match, using the same kind of ammunition as last year, were befriended in a similar manner. Preceding last year's contest they experienced endless trouble on account of irregular elevation in the ammunition. They were not even sure where the trouble lay, but one of their most expert shots, Dr. W. G. Hudson, wrote to Mr. Thomas, of the Union Metallic Cartridge Company, asking for his assistance. The outcome was the Thomas bullet, which at once put up the scores with the service sights to a level not previously experienced except with match sights. It was of the behavior of the cartridge so evolved that Major Fremantle wrote in such terms of eulogy in his official report of last year's match. Now we have not only equaled the American cartridge, but have shown that the want of success of the .303 rifle is not a question of the arm, but of the ammunition. Hitherto we have supposed that the service rifle would not behave well under high pressures, but the 18 tons reached by the new cartridge seems to give no trouble.

Turning to the cartridges used by the various contestants in the Palma match, the French Lebel may be dealt with first. In shape the cartridge case is peculiar, the great width at the base giving it the appearance of a wide bottle. It contains 42.5 grains of a coarse leaflet powder, between which and the bullet is a jute wad and a disc of wax. A bullet taken from one of the cartridges was examined weighed 231.8 grains, and its diameter at the base was .321 inch. The neck of the case was squeezed very hard on to the bullet, and left a ring-shaped depression round it. The Norwegian cartridge contained 34.3 grains of coarse leaflet powder, the weight of the bullet being 155.3 grains, and the diameter .263 inch. There was a small wisp of cotton wool between the powder and bullet, doubtless put there to keep the powder at the base of the case. The United States cartridge contained 36.2 grains of W. A. powder, which consists of tubes cut into short lengths. The weight of the bullet is 220 grains, and its diameter at the base .308 inch.

The rifles used by the various teams did not give the competitors by any means an equal chance. Granting equally good-shooting rifles and ammunition for all teams, the advantage in armament must rest with the team whose service rifle is sighted in the most suitable manner for match shooting. In this respect the American team were exceptionally favored. They had a peep-hole back-sight and a nice means of making lateral adjustment for wind. The Norwegian fore-sight was also fitted with a traversing movement operated by a key. The French team were probably the worst served by way of sights, for their form of back-sight was not even adjustable between the limits of elevation laid down by the notches cut for each range. With the English rifle the sliding bar can be adjusted to a nicety by means of a vernier. The same instrument allowed for the drawing of vertical lines on the bar of the back-sight any specified distance right or left of the center, this line being placed at a point that affords the appropriate correction of aim for the average wind prevailing at the time of the competition. With a changeable wind the finer adjustments must be made by aiming right or left of the bull. The conditions of the Palma contest are thus rendered very interesting. The match is a curious competition of ammunition and actual shooting skill, the extent to which the nations represented have adapted their service arms to the conditions of range shooting introducing an additional regulating influence of great importance.

The characteristic methods of the leading teams merited careful notice. The Americans are still comparatively unskilled in the art of wind judging by the aid of the telescope, this process consisting in watching the drift of the mirage across the range, which gives a far better index of the conditions affecting the flight of the bullet than the behavior of the flags. Colonels Gibbs and Hop-ton acted as coaches for the English team. Their eyes were glued, so to speak, to two powerful telescopes, and the results of their observations were communicated to the shooters. The coach for the American team, on the other hand, interfered very little with his men, who were all first-class individual marksmen. The day was hot, and the wind was blowing across the range. Its strength was variable, but not its direction. Our chief opponents described it as a genuine bit of American weather, and they were consequently favored in this respect, and thoroughly at home in it. The British team would have liked what is known as a fish-tail wind, that is, one blowing up or down the range, first quartering to one side, then to the other. As it was, the experienced coaching, which is the specialty of the British team, was fully counterbalanced by the advantages of sighting possessed by the most dangerous of our rivals.

All things considered, the match was one of the best contested it is possible to imagine. The winning team made 1,570 points against 1,555 by the British team, the victory having thus been gained by an advantage in points of 1 per cent. During the entire match not a single miss was recorded by either of the two leading teams, whereas last year the British team missed the target twelve times and the Americans seven.—London Field.

Rifle at Shell Mound.

SAN FRANCISCO, Cal., July 13.—The scores at Shell Mound range were hardly up to the average yesterday. Doubtless some of our riflemen are preparing for their annual deer hunt, as the season opens this week. Scores:

Golden Gate Rifle and Pistol Club, monthly medal shoot: Pistol trophy—W. F. Blasse 86, D. D. Smith 81, G. Armstrong 70, A. Thode 71, M. Kolander 63. Re-entry match: W. C. Pritchard 93, 93, 92; G. Armstrong 89, 85, 83, 81; W. F. Blasse 85, 85, 83; Dr. D. Smith 81. Revolver trophy: S. C. Hinkel 85, J. R. Trego 85, M. J. White 86, H. Kruckel 73. Re-entry match: P. A. Becker 93, 91, 89; J. W. Tompkins 82; A. H. Pape 88, 87; F. Kruckel 77, 77, 77; J. Kullman 88, 83. Gold medal: M. Kolander 212, 211, 209, 212, 203, 205, 205; W. Burkholder 202, 201. Medal bars: M. Blasse 214, 204, 207, 202, 213; G. Armstrong 189.

Club trophy: A. Gehret 221, D. B. Faktor 218, O. Bremer 216, M. Kolander 212, M. Blasse 207, W. Burkholder 206, G. Armstrong 127, J. Kullman 180, M. J. White 161.

Re-entry match: C. M. Henderson 218, 214, 215; A. Gehret 217, 217, 217; D. B. Faktor 215, M. Kolander 202.

Germania Schuetzen Club, monthly medal shoot: First champion class, F. P. Schuster, 226; second champion class, N. Ahrens, 222; first class, D. Salfeld, 204; second class, M. Kolander, 218; third class, John Beuttler, 108; best first shot, A. Gehret, 25; best last shot, W. F. Blasse, 25.

Competition shoot: A. Gehret 225, D. B. Faktor 222, H. Huber 208, N. Ahrens 207.

San Francisco Schuetzen Verein, monthly medal shoot: Champion class—Highest score, August Pape, 436; champion class medal, Herman Huber, 425; first class, Lieut. David Salfeld, 407; second class, not filled; third class, John De Wit, 365; fourth class, John Beuttler, 370; best first shot, George H. Bahrs 24; best last shot, Otto Lemcke, 25.

ROEEL.

Stevens Rifle Contest.

ROCK ISLAND, Ill., July 18.—A counter attraction and high wind diminished the attendance, and only one shooter shot on record. His score is as follows:

Sperry	10 8 6 6 8 7 10 5 8 5—73
	7 6 7 8 8 9 5 8 7 7—72
	10 8 9 10 7 8 7 8 8 6—81

July 25.—The Stevens rifle contest, held to-day, had records as follows:

Bahusen	2 4 1 1 10 4 7 5 6 4—44
	4 7 8 6 5 8 5 4 4 7—53
	2 6 5 4 3 5 4 7 6 8—50
Hepenstell	3 4 9 6 8 5 8 7 4 7—61
	5 5 7 4 9 4 4 8 9 8—63
	8 5 4 6 5 7 8 9 6 7—65
	7 7 6 5 7 9 9 4 9 6—69
	5 4 6 9 6 6 5 7 5 5—68
	6 6 4 9 7 6 7 8 8 4—65
Durham	5 3 8 5 7 6 5 8 9 9—65
	4 7 3 8 5 4 6 6 8 9—60
	6 7 5 7 4 5 7 4 3 5—63
	5 8 7 6 4 8 4 7 5 7—61
	9 2 7 3 5 6 9 4 10 7—62
	4 8 5 6 7 3 5 6 2 4—49

American target, reduced to 100yds. range, .22 cal. rifle.

C. W. DURHAM, Sec'y.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of this Association on July 19 the following scores were made.

A tricky fish-tail wind, from 4 to 8 o'clock, prevailed all day, and kept down high scores. Strickmeier was champion with 225. Conditions, 200yds., offhand, German ring target:

Strickmeier	225 223 211 208 208	Honor.
Gindele	218 213 211 210 204	65
Roberts	214 213 201 201 196	67
Odell	214 210 207 207 204	66
Nestler	212 204 204 201 200	60
Bruns	205 194 188 187 190	67
Lux	204 201 200 199 193	51
Hofman	204 200 198 193 193	68
Freitag	201 188 188 183 183	60
Trounstone	188 186 185 167 163	57

The American rifle team began its homeward journey from Bisley on July 25, the first stop of importance being at Liverpool. They were given a hearty, friendly send-off. Major-General Lord Cheylesmore, chairman of the Council of the National Rifle Association, delivered the farewell speech, which was responded to by Col. Leslie C. Bruce, of the American team.

Concerning other competition at Bisley, the press dispatches state that the entries for the last and most important competitions of the meeting, except the competition for the Palma trophy, namely, the King's prize and the St. George's vase, were curtailed somewhat in a sensational fashion by the posting of an official notice that Corporal J. W. Garvie, and Private F. Watson, of the same regiment, were barred not only from the above events, but from all subsequent competitions on the National Rifle Association ranges, and that they would forfeit all prizes won during the present meeting. Both men had qualified for the St. George's final stage, and Garvie had qualified for the King's Hundred. The Association's announcement reduced the number of competitors for the St. George's vase to ninety-eight, and the number of competitors for the King's Hundred to ninety-nine. The official charges against Garvie and Watson are tampering with the scores at a provincial meeting. Both men denied the charges, and threaten to sue the National Rifle Association. The St. George's vase was won by Capt. Hohnson, of the London Rifle Brigade, with a score of 135. The King's prize and gold medal were won to-day by Color Sergeant Davis, of the Third Glamorgan Volunteers, with a score of 311. This is the second time Davis has won the King's medal, a feat which has been accomplished only once before in the history of the competition.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

July 30-Aug. 1.—La Crosse, Wis.—The Interstate Association's tournament, under the auspices of the La Crosse and Viroqua gun clubs. John M. Moore, sec'y.

Aug. 4-5.—Head and Dunbar's annual midsummer target tournament at Bass Lake, Ind. Address J. L. Head, Peru, Ind.

Aug. 6-7.—Marshalltown, Ia., Gun Club two-day tournament.

Aug. 6-6.—Millport, Pa.—Oswayo Valley Rod and Gun Club's two-day tournament. M. S. Dodge, Sec'y.

Aug. 6-6.—Brownsville, Pa., Rod and Gun Club's tournament.

Aug. 9.—Jersey City, N. J.—All-day shoot of the Hudson Gun Club. James Hughes, Sec'y.

Aug. 10-11.—Wolcott, N. Y.—Two day tournament of the Catchpole Gun Club. E. A. Wadsworth, Sec'y.

Aug. 12-13.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selember, Sec'y.

Aug. 12-15.—Toronto, Ont.—Annual tournament of the Dominion Trapshooting and Game Protective Association. A. W. Throop, Sec'y-Treas., Ottawa, Can.

Aug. 18-20.—Grand Rapids, Mich.—Second annual target tournament of the Consolidated Sportsmen's Association of Grand Rapids; \$1,000 added. A. B. Richmond, Sec'y.

Aug. 19-20.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selember, Sec'y.

Aug. 18-21.—Ocean City, Md.—J. R. Malone's ninth annual summer tournament; open to all; \$100 added money. J. R. Malone, manager, 2671 Pennsylvania avenue, Baltimore.

DRIVERS AND TWISTERS.

The next Ossining, N. Y., Gun Club shoot, prize series, will be held on Aug. 8.

The next shoot of the Berkshire county, Mass., Trapshooters' League, will be held at North Adams, on Aug. 1.

Mr. J. L. Head, of Peru, Ind., informs us that Aug. 4 and 5 have been fixed upon as the dates for Head & Dunbar's annual midsummer tournament at Bass Lake, Ind.

At a shoot at Newport, R. I., on Wednesday of last week Mr. J. A. R. Elliott was high average with 167 out of 175 targets; E. C. Griffith was second with 165 out of 175.

In the contest for the Grand Hotel cup at Indianapolis, Ind., on July 23, Mr. C. O. Le Compte, of Eminence, Ky., defeated the challenger, Mr. H. M. Clark, of Wabash, by a score of 46 to 45.

The twelve-man team match, 25 targets per man, between the Nishoyne Gun Club, of Orange, and the Mountainside Gun Club, of West Orange, N. J., was won by Nishoyne by the score of 241 to 217.

The Florists' Gun Club, of Philadelphia, Pa., announces its first annual tournament, to be held on Sept. 30 and Oct. 1 and 2. Mr. J. K. Starr, the famous tournament expert, will act as manager. His address is No. 1216 N. Twenty-eighth street.

Prof. Edmund H. Osthaus, of Toledo, O., eminent as the foremost artist in the realistic portrayal of field scenes, returned from his wedding tour on Monday of last week. He was upward of five months in Europe, most of the time in Germany and Italy.

In the Troisdorf medal series of contests, held by the Cincinnati Gun Club, Mr. L. F. Ahlers won first. Of the ten contests, aggregating 500 targets, he broke 440, 88 per cent. His average distance was 20½yds.

Mr. Frank Simpson, of Winnipeg, Man., won both the West Canadian championship, and the International individual championship, at the annual meeting of the Winnipeg gun clubs, July 21 and 22.

The Hudson Gun Club, of Jersey City, announces a tournament for Aug. 9. The programme provides a total of 200 targets, at 1½ cents. There will be a 100-target handicap, high guns; prizes, \$5, \$3 and \$2, respectively. There also will be a prize for high average for the day.

In the programme events of the Frogg Inn Gun Club shoot, near Jamaica Bay, L. I., on Saturday of last week, Mr. J. A. R. Elliott broke 122 out of 125 in the sweepstake events, and 24 out of 25 in the team event, a total of 146 out of 150, better than a 97 per cent. performance.

The famous trap shot, Mr. L. T. Duryea, of New York, returned from an outing at Turtle Lake, Wisconsin, on Monday of this week. He reported most successful black bass fishing and pleasing game prospects, particularly the prospect of an abundance of ruffed grouse. He was in excellent health.

Mr. John S. Wright, announces that the Brooklyn Gun Club will hold a shoot on Saturday of this week on the new grounds, Kaiser's Farm, commencing at 2 o'clock. To reach the new grounds take Kings County Elevated Railroad to Crescent street, thence by bus to the grounds.

The Rochester, N. Y., Rod and Gun Club have fixed upon Sept. 2 and 3 for a two-day target tournament. It is now over a year since this club held a shoot, and there is the keenest of local interest to participate in trapshooting competition. The management contemplates offering important sums as added money and average money both for the one day and two days' grand averages.

The programme of the Ossining, N. Y. Gun Club annual Labor Day shoot, Sept. 7, provides ten events, six at 20, four at 15 targets, \$1.40 and \$1.30 entrance, \$2 and \$1.50 added money, class shooting; a total of 180 targets, \$18 added money, \$13.60 entrance. The shoot will take place rain or shine. The Ossining Club members have achieved a just fame for good fellowship and game competition, so that visitors are assured of a pleasant day.

A correspondent writes us that "there will be a live-bird match at Mahanoy City Park on Aug. 15 between Henry Krouse, of Evervale, Pa., and Frank Broadbeck, of Morea, Pa., for \$600 and the gate receipts; each man to shoot at 17 birds, trap and handle; Schuylkill county rules to govern. The friends of each of the shooters have already commenced to train birds for the event. It has attracted an unusual amount of interest in this and surrounding counties. It is expected that over one thousand people will pay 50 cents each to see the match.

Mr. C. G. Grubb, secretary of the W. P. T. S. L., informs us that in addition to the ½ cent added to the purse for each target trapped, the Brownsville Rod and Gun Club will add \$200 to the purses as follows: \$80 to each day's programme; \$6 to the 15-bird and \$10 to the 20-bird events, and \$40 to the four low guns shooting the entire programme and not winning their entrance, to be divided equitably between them, and not to pay more than their entrance. Shoot rain or shine. Shells shipped, charges prepaid, to W. T. Daugherty, Brownsville, Pa., will be delivered on shooting grounds free of charge."

The following, from the Jersey City Journal, is of special interest: "Ex-Judge George B. Eaton, of Pavonia avenue, and Uncle Al Heritage, both of whom were mighty Nimrods in the days before spectacles became a necessary acquisition, have been matched under their nom de plumes of "Jacobstaff" and "Southpaw," respectively, to shoot a 20-live-bird match for points at either Hen Outwater's or at the Guttenberg race track, in the early part of August. The bird shoot will be witnessed by a large crowd of admirers of the two experts. The match is for a wine supper for a party of twelve." We learn that each of the contestants is impatiently awaiting the day of the competition, sniffing the battle afar off.

The programme of the Indian fifth annual tournament and powwow to be held at Arnold's Park, Lake Okoboji, Iowa, Aug. 25-28, provides twelve like events each day; eight at 15 and four at 20 targets, entrance \$1.50 and \$2; to the 15-target events, \$10 added; to the 20-target events, \$15 added. Grounds open for sweepstakes on Aug. 24. Shooting commences at 9 o'clock. Class shooting will govern the purses. In the 15-target events, 40, 30, 20 and 10; in 20-target events, 30, 25, 20, 15 and 10. Sergeant system will be used. Ship shells, etc., to C. W. Budd, Arnold's Park. To the high guns from one to ten inclusive, shooting through the four days, will be awarded cash prizes as follows: \$17, \$15, \$12, \$10, \$9, \$8, \$7, \$6, \$5 and \$5. Three cups of equal value will be awarded the highest averages as follows: One to 90 per cent. and over; one to 80 to 89 per cent; one to below 80 per cent.

The programme of the Dominion of Canada Trapshooting and Game Protective Association's third annual tournament, to be held on the grounds of the Stanley Gun Club, Toronto, Can., Aug. 12-15, has many attractive events. On the first day there are ten events at 20 targets, \$2 entrance. Nos. 2, 4, 5, 7 and 9 have \$50 guaranteed. No. 3 is a cup contest, gold medal to winner. A gold badge, donated by the Hunter Arms Co., goes to winner of high average on this day. There are ten events on the second day, nine of which are at 20 targets, \$2 entrance, and six of which have \$50 guaranteed. No. 6 is for the two-man team race, championship of Canada; 20 targets per man, \$4 per team. A silver cup goes to the winner of high average on this day. On the third day, there are nine events at 20 targets, \$2 entrance; six events with \$50 guaranteed; and one at 30 targets, \$3 entrance, for a gun donated by Parker Brothers. A cup will go to high average for the day. On the fourth day, the first event will be the eight-man team race for the championship of Canada, targets 20 per man, \$2 entrance per man; high guns, two moneys. The second event will be the preliminary handicap, 20 targets, \$2 entrance, \$50 guaranteed. The third event will be the Grand Canadian Handicap, 100 targets, \$5 entrance, high guns, for the Association cup. The fourth event is the Mail trophy, emblematic of the five-man team club championship of Canada. There are a number of other cups, and medals for the winners, and for high averages. The members of the Handicap Committee are Mr. D. McMackon, Highgate, Ont.; Capt. J. F. Higginson, Ottawa; Dr. J. E. Overholt, Hamilton; Mr. Alex. Dey, Toronto; Mr. J. H. Johnson, Toronto. Mr. Thomas A. Duff, of Toronto, is president; Mr. A. W. Throop, Ottawa, is secretary-treasurer.

The programme of Mr. J. R. Malone's ninth annual summer tournament, to be held at Ocean City, Md., Aug. 18-21, is now ready for distribution. Added money, \$100. Open to all. The members of the Tournament Committee are Dr. H. E. Lupus, John W. Chew, L. German and W. Ford. The members of the Handicap Committee are J. R. Malone, J. M. Hawkins, E. Storr and J. W. Chew. Mr. Malone is the manager; Mr. Hawkins, assistant manager. On the first day, commencing at 3 P. M., the programme provides eight events for preliminary practice, alternately at 10 and 15 targets, 50 and 75 cents entrance. On the second and fourth days, respectively, twelve events are provided, of which ten are at 15 targets, two at 20 targets, entrance \$1.30 and \$1.40; added money, \$3 and \$5. On these days, shooting commences at 9 o'clock. On the third day, commencing at 10 o'clock there are three live-bird events on the programme. No. 1 is at 5 birds, \$3 entrance, two moneys, 60 and 40 per cent. No. 2 is at 7 birds, \$5 entrance, two moneys, 60 and 40 per cent. No. 3 is the Ocean City Handicap, 20 birds, \$10 entrance, three moneys, 50, 30 and 20 per cent. The winner of this handicap will also receive a handsome silver cup. Birds are included in each event. Live bird handicaps, 25 to 32yds. From the net amount of purse in each target event, 5 per cent. will be deducted, and the total sum so deducted will be divided pro rata among the amateurs who shoot through the entire programme, and who do not win their entrance back. The distance sliding handicap will govern. Those who wish may shoot for targets only. Known traps, unknown angles. Rose system, 5, 3, 2 and 1. Targets, 2 cents. Guns and ammunition, prepaid, marked with owner's name, and forwarded to J. Kelly, New Congress Hall, Ocean City, will be delivered on the grounds free of charge. Palace steamer leaves Pier 4, Light street wharf, Baltimore, at 6:30 A. M. and 3:30 P. M.; or take Pennsylvania R. R. train at Wilmington, Del., for Ocean City. For further information, address the manager, Mr. J. R. Malone, 2671 Pennsylvania avenue, Baltimore. Shore bird shooting will be a feature.

BERNARD WATERS.

Colt Gun Club.

HARTFORD, Conn.—One of the most successful shoots of the season of the Colt Gun Club was held Saturday, July 25. The weather was perfect for trapshooting, and some good scores were made.

The Bristol Gun Club members were visitors, and, as usual, the extremely friendly team race of these two clubs was the most interesting part of the programme. It resulted in Bristol carrying off the laurels to the tune of 100 to 94, at 125 targets a side. Scores of the team shoot, 25 targets per man, follow:

Bristol.					Colts.				
Mills	23	23	23	23	Hollister	24	24	24	24
Porter	22	22	22	22	Hubbell	18	18	18	18
Moran	21	21	21	21	McFetridge	18	18	18	18
Casey	18	18	18	18	Colt	17	17	17	17
Large	16-100	16-100	16-100	16-100	Herman	17-94	17-94	17-94	17-94
As will be seen, Mr. Hollister not only led in the team shoot, but made the highest score of the day. Following is a list of the final scores:									
Events:	1	2	3	4	Events:	1	2	3	4
Targets:	25	25	25	25	Targets:	25	25	25	25
Mills	23	23	23	23	Nichols	16	20	20	20
Treat	15	22	22	22	Colt	16	17	17	17

Hollister	17	24	20	20	Clark	11	11	11	11
Hubbell	21	18	23	23					

R. McFETRIDGE, Sec'y.

Trap at Litchfield.

LITCHFIELD, Ill., July 22.—The third successful tournament of the Litchfield Gun Club for this season was held to-day. Early in the spring of 1903 the manager, Hugh Snell, conceived the idea of giving popular shoots that would draw and hold the country boys. How well he succeeded has now been chronicled for the third time. He has proven that tournament managers have gone wrong by giving 15, 20 and 25-target events as their programme. He has fully demonstrated that the old-time 10 event was the popular one. In the first place, it attracts the shooters to come to the tournament, and then when present, they stay and shoot all day.

Not alone this, but the money divisions have been popular—four equal parts. Thus, the best shots have been winners and the poorer ones have not been so much loser.

Money prizes have been awarded to high averages, and longest run, and this has been an incentive for the high man.

The traveling men present were J. M. Hughes, and he "showed us" by lining out 98 out of 100. He had as side partner Mr. Leslie Standish, the Illinois missionary, and they made a good team.

John Boa ran up from Alton and found that his gun was not in good condition, and he could talk better than he could shoot. But he will make good some other time. The scores:

July 18.—Cincinnati Gun Club cash prize contest, distance handicap: R. Trimble, 21yds., 45; Sunderbruch, 16yds., 45; Fulton, 16yds., 43; Gambell, 20yds., 41; Barker, 20yds., 41; Ahlers, 19yds., 39; Falk, 17yds., 38; J. B., 18yds., 37; Herman, 18yds., 36; Williams, 18yds., 36; Linn, 18yds., 34; Jack, 16yds., 34; Maynard, 18yds., 34; Medico, 20yds., 33; Faran, 18yds., 32; Frohlinger, 15yds., 29; Colonel, 14yds., 18.

Team race, 30 singles and 10 pairs; two high teams out:

Gambell26	17-43	Sunderbruch22	14-36
Faran25	17-42-85	Fulton24	16-40-7
Ahlers23	15-38	Linn21	17-38
Medico28	19-47-85	Williams20	14-31-7
J. B.28	16-44			
Herman25	14-39-83			

Mahanoy City Gun Club.

THE two days' tournament at Mahanoy City, Pa., was well supported by the shooters, thirty-seven of whom participated in the events of the first day.

The manufacturers' representatives were Messrs. Frank Lawrence, Luther J. Squier, E. D. Fulford and Frank Butler. The audience was large and enthusiastic. The meeting was very satisfactory. A number of the contestants were new in tournament shooting, as they never had therein shot before. The squad hustling was done by Messrs. Lawrence and Butler.

Mr. Geo. S. Trafford came over from Lebanon and started in to clear up the professionals, and he was in a fair way to do it when his shells gave out. The shells which he had ordered for this shoot failed to arrive; hence he had to change his load; nevertheless, he finished high amateur on the first day.

The Shamokin boys made a fine showing, lining up sixteen strong.

Much credit is due to Mr. Fen Cooper, who managed the shoot. It was a success.

Mr. Luther J. Squier has not yet got into his best form, but he nevertheless won second high general average.

Mr. Frank Butler got so busy that he could not stay for the second day, and Mr. Fulford was left without a manager, but he won high general average.

Frank Lawrence was the business man at the shoot, demonstrating the excellence of his firm's goods, and if the shooters are not all buying the guns and shells which he recommends, it is no fault of his.

Mr. Frank Broadbeck, the great trap and handle live-bird shot, gave an exhibition of how to break targets with the gun held below the elbow until the target shows. He is all right, but O my! how careless with a loaded gun.

July 22, First Day.

Event 4 was at 5 pairs. Event 8 was at 10 pairs.

Trap at Grafton.

GRAFTON, N. D., July 18.—A very good one-day tournament was held here to-day, under the auspices of the local gun club. The programme carried ten 15-bird events, with \$5 added in each, courses divided Rose system and open to amateurs only. Arrangements were excellent, but the weather so rough that only top score, made by Mr. Hirschy, was within the 90 per cent. circle.

IN NEW JERSEY.

Schortemeier's Shoot.

Carlstadt, N. J., July 22.—The live-bird shoot given by Mr. J. H. Schortemeier on J. H. Outwater's grounds, Carlstadt, was well attended. The forenoon was clear and pleasant. A stiff wind blew across the traps from right to left, assisting the birds materially. In the afternoon, the sky darkened, the wind subsided, and about 3 o'clock a heavy rainstorm set in. The birds were a mixed lot, some good ones, many ordinary. They seemed reluctant to take wing, and as a consequence, there were a large percentage of sitters. In the 15-bird event, Mr. Emile Steffens was the only one to kill straight, and first money amounted to \$12. The moneys were divided according to the Rose system. Five killed 14, five killed 13, three killed 12 and one killed 11, making fourteen out of 21, which were in the money. The scores:

First event, 5 birds, \$2, all at 28yds.: Hathaway 3, Van Valkenburg 3, Richter 4, Morrison 2, Allison 5, Costello 4.

Ten birds: Piercy, 31yds., 10; Van Valkenburg, 28yds., 8; P. May, 9; Welles, 30yds., 8; Richter, 27yds., 7; Hathaway, 28yds., 7; Allison, 9; Morrison, 27yds., 8; Wilson, 28yds., 7; Reiersen, 28yds., 7; Capt. Dreyer, 27yds., 7; Dr. Hudson, 28yds., 9; W. J. Simpson, 30yds., 9.

The main event at 15 birds, \$8.75 entrance, birds included, had twenty-one entries. The scores follow:

H. S. Welles, 30	22202222022222	13
H. Pape, 28	202220222212200	11

Hudson Gun Club.

Jersey City, N. J., July 26.—These scores were made at the last shoot of the Hudson Gun Club.

This club will hold an all-day shoot on Aug. 9. The programme will call for 208 targets at 1½ cents for all shooters. There will be a 100-target event, handicap, for which there will be three prizes to high guns. The first is a \$5 gold piece donated by Mr. George Piercy. The second prize will be \$3, and the third prize, \$2.

All ties for prizes in the 100-target race will be shot off at 15 targets, then miss-and-out.

The club will also give a prize for high average for the day; the 100-bird race does not count in the averages. Programme shooting will begin at 10 A. M. sharp. Refreshments can be had at the grounds.

Providence-Aquidneck Gun Clubs.

THE Providence-Aquidneck gun clubs' midsummer tournament, given under the joint auspices of these two clubs at Newport, R. I., on Wednesday, July 22, was a most successful and enjoyable affair. The weather was fine, the attendance satisfactory and the shooting was of a high order.

The high average for the day was made by Mr. E. H. Storr, of Baltimore, with 154 out of 165, though the last event of 25 was a special event, and did not count for the high average. The high amateur average was tied for by Messrs. H. A. George, of Charlottesville, and S. P. Sillings, of Staunton. This tie was shot off miss-and-out, and was won by George, as was also the longest run. The local club extends its thanks to the trade representatives who were present, and rendered such valuable aid. The scores follow:

Providence-Aquidneck Gun Clubs.

THE Providence-Aquidneck gun clubs' midsummer tournament, given under the joint auspices of these two clubs at Newport, R. I., on Wednesday, July 22, was a most successful and enjoyable affair. The weather was fine, the attendance satisfactory and the shooting was of a high order.

Those present included the cream of Rhode Island trapshooters, as well as many from a greater distance. Mr. J. A. R. Elliott was on hand and gave a rare exhibition of gun pointing, averaging 95 per cent. He was accompanied from New York by Mr. Hlodges, of Olathe, Kans., who with his family has been sojourning in the East for a few weeks. From Norwich, Conn., came Messrs. Taft and Mitchell, of the Norwich Shooting Club.

Griffith was a close second, landing but two targets behind Elliott. Elliott also won the long run prize with 53 straight, and other nice runs were made by several. Griffith made two of 35 each.

For the home club Bowles made the creditable total of 147, averaging 84 per cent. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	Shot

Rochester Rod and Gun Club.

ROCHESTER, N. Y., July 22.—Mr. H. M. Stewart, scratch, made a straight score of 25 in both the main events, as per the appended scores.

The Rochester Rod and Gun Club is preparing for a two day tournament to be held Sept. 2 and 3. A large attendance is assured, as already a number of prominent trapshooters have signified their intention to be present. The programme will consist of ten events each day, with 20 targets in each event. Money will be added to the purse in each event, and a grand average prize will be given for the best general average each day.

The headquarters of the shooters will be at the Hotel Eggleston. The programme will be out in a few days.

Club handicap:

	Allowed.	Broke.		Allowed.	Broke.

Ossining Gun Club.

OSSINING, N. Y.—The scores herewith were made at the regular bi-monthly prize shoot of the Ossining Gun Club, July 25. Events 5 and 6 were the regular prize events. No. 7, at 10 targets, was for a special prize given by the captain of the club. Hyland won first in the first event on the toss of a coin. Hubbell shot Hyland out on the second target in a miss-and-out for first prize in the second event. Burns won the special prize in event 8. The next series of prizes will be shot for on Aug. 8. Blandford shot his new prize Lefever to-day with excellent results.

C. G. B.

Winnipeg Gun Club.

THE monthly medal shoot of the Winnipeg Gun Club was held to-day at the club grounds on St. John's Common. Scores in the various classes were as follows:

Class A: R. J. McKay 23, C. M. Scott 22, F. G. Simpson 22,
H. Lighthead 21, F. Cadham 19, M. Putnam 11.

Class B: H. B. Trotter 20, J. McIntyre 12, H. Hargrave 12. A number of visitors up for the tournament this week were present, and participated, Riehl making the only clean score of the day. Scores: Riehl 25, E. Cavalier 23, A. Brittan 22, C. H. Parker 11, J. Brown 20, M. J. Miller 16, R. W. Main 17, Jas. Marsh 18, H. A. Durkee 17, R. Girdlestone 18, E. J. Harrison 11, B. O. Seymour 21, G. Cochrane 15. — HAWKEYE.

PUBLISHERS' DEPARTMENT.

The Union Metallic Cartridge Company, Bridgeport, Conn., have artistically prepared a souvenir cartridge, of the high-power kind used by the American team in the recent successful contest for the Palma trophy, and they will be pleased to send one to each applicant.

The Winchester Repeating Arms Company, New Haven, Conn., announces that the Winchester rifle, model 1903, automatic, hammerless, takedown, adapted to the .22cal. rim-fire cartridge, is now on the market. To manipulate it in action all that is necessary is to pull and release the trigger at each shot. The recoil ejects the empty shell, cocks the hammer, and reloads. The rifle weighs about 5½ pounds. Length over all, 36 inches. For descriptive circular, address the W. R. A. Co.

Game laws are said to be directly opposed to the liberties of the subject; I am well persuaded that they may be carried too far, and that they really are in most parts of Europe. But it is equally certain that where there are none, there never is any game; so that the difference between the country where laws of this kind exist and that where they are unknown, must be that in the former very few individuals will enjoy the privilege of hunting and eating venison, and in the latter this privilege will be enjoyed by nobody.—Diary of John Quincy Adams, 1787-8.

AN INSTRUCTIVE PREAMBLE.

THE framers of Tennessee's new game law have improved the opportunity to embody in the first section of the measure a preamble setting forth the basic principle of the ownership and control of game. It is enacted by the people of Tennessee in Legislature assembled:

"That the wild game within this State belongs to the people in their collective sovereign capacity. It is not the subject of private ownership except in so far as the people may elect to make it so; and they may, if they see fit, absolutely prohibit all taking of it or traffic or commerce in it, if it is deemed necessary for the protection or preservation of the public good. Therefore all game or wild animals or wild birds now or hereafter within the State not held by private ownership legally acquired, and which for the purposes of this act shall include all quadrupeds and birds mentioned in this act, are hereby declared to be the property of the State; and no right, title, interest, or property therein can be acquired or transferred, or possession thereof had or maintained except as herein expressly provided."

This is, of course, sound doctrine, and it was well enough to make it a part of the statute. Such expositions of the fundamental principles cannot be made too often. There still prevails widespread and diverse popular misconception of relative public rights and personal rights in game. Not until the individual shall understand that he has no rights in game other than such as are accorded to him by the State, may we expect him to respect and abide by the game laws.

A NOISE IN THE NIGHT.

FROM New Orleans comes a pathetic story of a dog which died of a broken heart. George Luce, a resident of Prytania street, owned a pure bred collie, Bruno, which was valued and loved as the children's playfellow and the guardian of the house. Next door lived Joseph Marks, who had no love for dogs and could not sleep when they barked and howled and bayed under his window at night. Bruno, Marks averred, persistently practiced all these nocturnal accomplishments, and recourse was had to the courts to stop his continuous performance. Marks brought suit against Luce, and secured an injunction forbidding Bruno's barking. Bruno barked, and Marks had resort to a rule of contempt, which was granted by the court. Bruno was then sent away and consigned to the care and keeping of a servant, but could not endure his banishment. "That night Bruno sickened. Yesterday morning he died, and had a human being died under the same circumstances the world would have said a heart was broken by the strokes of a fate deemed all too cruel, but as it was a dog—it died of extreme nervousness."

Aside from the pathos of the dog's taking off, the feature of the circumstances which is most worthy of note is the success of Marks in abating the nuisance of the noise at night. The result he secured was by no means the usual ending of such cases. As a rule, the next door neighbor complains, but the dog keeps on barking just the same.

The dog that barks o' nights is a prolific source of discord among neighbors. In a city block, where the houses are built around four sides of a square, one vociferous and megaphonic dog may irritate many people awakened and kept awake by his maddening uproar. As a rule, the neighbors suffer in silence. Frequently the dog and his master are recommended to the attention of the authorities; but the obstacles which the board of health and the police put in the way of a sufferer seeking relief are usually such as to deter activity in this direction.

In theory the citizen is entitled to repose at night, and the board of health and the police are provided to secure him in the enjoyment of that repose; as a matter of fact

they do no such thing, save in exceptional cases. As a rule the sufferer who seeks to abate the dog barking nuisance by the duly provided legal and lawful means discovers that the mode of procedure is practically inoperative; and discouraged by the futility of his efforts for relief, nerves himself to endure the ills he cannot cure.

CONCERNING THE CHILDISHNESS OF THE GROWN-UP.

It is a common observation that human nature is much the same the world over. Mankind, civilized or savage, has a great uniformity in inherited characteristics; the greatest differences are to be found in his acquired knowledge.

Primitive man, simple, untutored, undeveloped in mind, has been compared to a grown up child. Savage tribes have their leaders who, feeling the superiority consequent to superior knowledge, popular homage, and official station, comport themselves with great and serious dignity, analogous to their civilized compeers under like conditions. But civilized man, adult and mature, has quite as much of the grown-up child in his nature as has the savage. It manifests itself in a thousand forms in his unconventional, unstudied, playful moments.

New York may be taken as the most conspicuous exemplar of the grave, sedate man of affairs and the intelligent child, in one and the same person. In no city in America is life so intense as in New York. The most work and the most play must be pressed into the smallest measure of time. If the man would play he must play quickly. And, at play, he is not burdened by conventionality. He reverts to the simple ways of primitive man.

In the hot days of summer the seashore is a favorite playground for the dwellers of New York. Two circumstances contribute to this condition—it is a pleasurable place to sojourn, and it is the only available place for the masses. Coney Island is the most famous gathering place for that large and useful class of society called the people. It has been estimated that on each one of recent Sundays about 250,000 people, men, women and children, congregated there to enjoy the various simple amusements offered for their delectation.

The grown up woman rides side by side with the callow girl on the wooden horses of the merry-go-round, each with the same expression of proud pleasure flowing from conscious skill and graceful horsemanship. Betimes a man, long past the meridian of life, side by side with the boy, will venture to take the childish ride; and to the clamor of the machine music and the gallop of the machine horse, he throws out his chest, sits proudly erect, and assumes all the airs of realism as if he were the conquering hero.

The seashore, on the warm days, swarms with people. The gray-whiskered man may be seen with the boy's toy shovel, gravely scooping sand over his gray-whiskered reclining friend with a purpose to bury him. As the work advances and success impends, they laugh merrily, as do the little boys near by engaged in a similar task.

In the water the man with the white whiskers splashes his friend with the gray head, both exhibiting the same merriment of their associate playfellows, the children of tender years.

One form of simple amusement seems to appeal strongly to the mature of both sexes. A tortuous shute, something like a half cylinder in shape, highly polished inside so that sliding is easy, is the mechanical part. The manner of enjoying the sport which it affords is to be seated in the shute, then so seated slide from the top to the bottom, and so ecstatic is this intellectual form of sport that, in the busy hours of the day, the shute is taxed to its full limit. The man and the child seem to enjoy it all in an emotional way, and to enjoy it equally. The big wheels, the bicycles which run on trolleys, the swings, the miniature railway trains, all have their patrons exactly alike in their emotional enjoyment, though varying greatly in size and external appearances, as becomes children between the ages of 5 and 70 years.

But the relaxation from care and labor thus afforded confers its benefits. It is the natural way of recuperation, and therefore the very best, even if it does show that human nature is much alike the world over, and that human nature is childish nature.

SPORTSMEN AND OTHERS.

MR. ABBOTT H. THAYER's plea for patience in discussing the matter of the preservation of forms of life must appeal strongly to all the mature generation of sportsmen. Nothing is more difficult than to give to our fellow men satisfactory reasons for the faith that is in us, whether it be our faith as to religion, or art, or science. By his training—his education, association, and environment from youth to middle life—each man builds up for himself a series of reasons for doing or for not doing various things, but these reasons, while to his mind all sufficient, may not at all appeal to the minds of his fellows.

It is commonly said that the primitive man desired to kill in order that he and his family might eat, and that the immature sportsman's wish to kill much game is merely a survival of this desire for food.

It is now coming to be generally believed that the less nature is interfered with the better, for it is nature that makes the world beautiful. There is beauty in art, but art can never equal nature. On the other hand, civilization is directly opposed to nature, and in the highest development of civilization nature scarcely exists.

It is unquestionably the fact that with maturity comes a lessened desire to kill, and an increased appreciation of the beauty of nature's objects, unspoiled by contact with man. So it often happens that men who, after having been for fifteen or twenty years mighty hunters before the Lord, at last put aside their guns and rifles, and, arming themselves with field glass or camera, still enjoy all the pleasures of the stalk, missing only the toil of the butchering and the return to camp laden with meat. Such men, sometimes shooting at a mark, find that their old skill with the rifle still remains with them, and have no special ambition to prove this by taking life.

On the other hand, there is more truth than at first appears in Mr. Paige's contention that in many cases it is the men who kill animals directly who are most active in preserving and increasing the animals for a useful purpose. Such men are foremost among those who advocate the establishment of game refuges in forest reserves; the establishment of Federal and State parks, where absolutely no killing shall be permitted; the abbreviation of open times for the killing of game; the limiting of bags; the killing of males only of the herbivorous animals.

It is too much to say that any one class is all right or all wrong. Presumably most of us prefer the right to the wrong, and each in his own way is striving to do what is possible—often little rather than much—to better the conditions that surround us, whether they have to do with fish, or birds, or big game. But, as Mr. Thayer remarks, we should discuss all these matters in temperate fashion, and not in a spirit too critical of our neighbors.

PERSONS engaged in the little-neck clam fishery are only too well aware that under existing conditions the clam is doomed to extinction. The demand is enormous, and the rewards of clamming are so great as to stimulate the industry far beyond a reasonable limit. The remedy proposed is to put the clam grounds into the same system of individual control which now prevails as to oyster grounds. Were the owners of clam grounds secured in their exclusive rights as are the owners of oyster grounds, with corresponding pains and penalties for infringement of those rights, each owner would look out for his own clams, and the supply would be continuously renewed from year to year by planting and protection, as in oyster farming.

There is no halo of romance about the little-neck clam, but the economic considerations are of substantial importance, and the clam is a resource which should be maintained. The subject might well receive attention at the meeting of the New England Fish Commissioners in Boston next month to consider the lobster situation.

THE tributes to Prof. Spencer F. Baird at the unveiling of the Woods Holl memorial the other day were expressive of the deep and lasting regard entertained for that great man by all who knew him. We have reprinted the paragraph from Mr. Livingston Stone's earlier paper because it is fitting that the qualities of Prof. Baird there described should be held up anew to our admiration. In honoring him by providing this monument of granite and bronze, the American Fisheries Society has honored itself.

The Sportsman Tourist.

Into Val del Bove.

The following paper is the conclusion of the narrative, of which the first part was given in our issue of July 25. It is from the pen of Maj. Albert Woodcock, at the time United States Consul, Catania. This relation of Maj. Woodcock's ascent of Mount Ætna was given in a series of letters to his son, Dr. A. J. Woodcock, Riverside Farm, Byron, Ill., who has most courteously edited them for publication in *FOREST AND STREAM*.

But two of our party responded to reveille, Mr. Aelig and myself. The order was:

"All who wish to ascend the cone to see sun-rise, fall into line." Mr. Aelig, a native of the Alps, who had climbed the highest peaks of Switzerland, the athlete of our party, fell into the line with fourteen others who had just arrived from Catania.

They filed away in their upward march. I seated myself by a snow pile and luxuriated in munching this delicious article unknown to Catania, unless brought down from Ætna on the backs of mules. I never saw the heavens so bright and beautiful but once before, and that was when I visited Ætna in 1884. I can never forget that scene. Very many starry clusters were visible that cannot be seen in the lower altitude. The constellations seemed larger, nearer, and glowed with a richer light. The "Milky Way" was broader; its effulgence more brilliant; and it seemed a great highway of bright glory stretching across the heavens, such as angels may frequent in their visitations to earth. Meteors shot in fiery curves through the sky. The myriads of stars that spangled the heavens mingled their sparkling radiance with that of the moon, and the great cone and its slopes were bathed in a soft, silvered light almost as bright as daylight. Shakespeare says there are sermons in stones. Certainly there was a most eloquent sermon in that beautiful starry canopy. Brydone accounts for this unusual brilliancy of the heavens as seen from Mount Ætna by saying:

"We had now passed through over 12,000 feet of gas vapor that blunts and confuses every ray before it reaches the surface of the earth."

I returned to the observatory, and to bed for another hour's rest, when we all arose and went out to see the sun rise from the Torre del Filosofo (Tower of the Philosopher). This tower is now in ruins; nothing remaining but its foundation, which is mostly composed of ancient bricks like those in the walls of the Greek theatre of Taormina. This tower is said to have been erected many centuries before Christ by Empidocles of Agrigento (now Girgenti), who was a poet and philosopher. He was doubtless a crank, for he afterwards threw himself into the burning crater, hoping thus to convince the people that he was a god. The mountain ejected one of his bronze sandals, showing to the people that he was but mortal like themselves. Horace speaks of him in his "Ars Poetica." The tower was probably built by the Roman Emperor Hadrian about A. D. 120, from which to witness sunrise.

Soft twilight was stealing upon us, gradually growing brighter. The Calabrian peaks emerged from the great sea below us, and seemed to be almost beneath our feet. Some flashes of red streaked upward from behind the eastern crests. The sea was of a dark gray, over which were rolling fleecy vapors. Soon the red streaks upon the sky flashed into colors of gold, the sea changing to a purple. As the sun showed its upper rim above a prominent peak, the sea changed from rose to ultramarine, and the vapors were driven away. We returned his glorious smile and were happy, for we were bathed in sunlight. The valleys away below us were in dark shade, but the peaks above them were bright with the rays of the sun. Mr. Aelig joined us radiant with pleasure at having seen sunrise from the top of the great cone. We took a hasty lunch, preparatory to our descent into Val del Bove. Our blankets, overcoats and everything but our rations were sent back with the mules to Nicolosi. When in Nicolosi we had engaged mules and drivers to enter the valley at its eastern outlet by way of Zaffarano and meet us at the foot of the great descent. With our two guides, Antonio and Vincenzo, we set out. We passed the ruined tower of Empidocia and soon came to a rocky crest overlooking the valley. Here we seated ourselves and passed a half hour in viewing the wonderful scenery outstretched below us. We looked down upon a great black gulf of horrid desolation cut out from the side of Mount Ætna. It is walled in by mountains on the north, south and west. These rise almost perpendicular into the heavens from 2,000 to 4,000 feet. On the west side the valley has almost eaten its way into the fiery heart of the monster volcano. It sloped to the east opening out towards the sea. The north wall, or mountain chain, is called Serra del le Concazio; the south, Serra del le Soluzio, which terminates at the west in the lofty peak, Mount Agnuolo. The great crater of Ætna forms the west wall.

Val del Bove is five miles in width. This great black chasm is sufficiently large to hold Mt. Vesuvius within its embrace, in which that volcano would appear insignificant by the side of its great compeer. Below us, seemingly beneath our feet, was a chain of lofty rocks called Serra Gianicolo, that curved around to the southeast. This rocky chain with the western part of the Solfizio Mountains encloses a region called Trifoglietto. According to Sir Charles Lyell and other eminent geologists this mountain basis was formerly a great crater of eruption like that of Mount Ætna. Its great throat is now filled up to the very lips of its distended mouth with volcanic sand, scoria and lava boulders.

About half way down the valley, jutting out from the northern wall, towers upward like a great pinnacle Rocca Capra (Goat Rock). A little to the west and south of Capra looms upward into the sky a great solitary rock called Masara. To the south of Masara is a lofty mountain peak called Finocchio Superiore.

Directly west of this is another and smaller crest named Finocchio Inferiore. Around the rocky base of these towering peaks the fiery lava had swept in rivers and congregated into billowy crests of stone.

A little further down the valley and near the south wall was visible the rocky brow of Mount Callana. Below us a short distance northeast of the Gianicolo rocks were two large craters side by side, thrown up in 1852. The large and easterly one is called Centenoria. From our high perch we looked down into the great black throats of these two craters. In past ages trees grew in this valley. Vegetation wove its carpets of green upon its inclined slopes. It was the great pasture field of herds of cattle, hence its name Val del Bove (Valley of the Oxen). Still, from the earliest records we have of this valley, serpentine courses of lava were visible wending their way through it. When Sir Charles Lyell first visited the valley in 1828 trees were still scattered through it with here and there an oasis of beautiful verdure breaking in upon its terrible sterility. The eruption of 1852, one of the greatest that history records, changed all this. The two craters mentioned above threw out a sea of lava that rolled over the valley, destroying every tree, and every green thing and converting it perfectly into a scene of indescribable horror.

Simond says:

"It is a hideous place like a pit in Dante's hell, disused for some unexplained reason and untenanted by friends." As we looked down upon it, it resembled a great sea of storm-tossed billows with curling crests, suddenly, as if by magic, turned to lifeless stone. Sir Charles Lyell visited the valley six years after the great eruption of 1852. He says, "The stern and severe grandeur of the scenery is not such as would be selected by a poet for a vale of enchantment." The character of the same would accord far better with Milton's picture of the infernal world; and if we imagine ourselves to behold in motion, in the darkness of night, one of these fiery currents which have so often traversed the valley we may recall:

"Our dreary plain, forlorn and wild,
The seat of desolation, void of light,
Save what the glimmering of these vivid flames
Casts pale and dreadful."

The fearful descent was before us, 4,000 feet downward, with a very steep decline. The guides said they had never known of a woman's essaying the descent. Prof. Silvestri told me the same, saying it would be very difficult for a lady. The order came to descend. The eye of our lady was resolute and she seemed full of confidence and cool courage. The guides lifted her down a great precipitous rock, we scrambling after as best we could. With a guide on either side she led the van in the perilous descent, the rest of us like bold squires following in the rear, save our Alps friend, Aelig, who shot off at a tangent far away in advance. A loose boulder touched with the foot would start downward, at first slowly and then instantly increasing its speed until, bounding and thundering with fury, it disappeared into the dark regions below. The declivity is composed of tufa rock, its surface being slightly sprinkled with volcanic sand, making it difficult to get a foothold. My Italian friend, Signori Allegro, who made the descent a few days ago, broke his alpenstock, fell, and commenced to roll downward. Had it not been for the agility of his guides he must have been dashed in pieces on the rocks below. He told me that when he was rolling downward he suffered in mind all of the agonies of a fearful death. About half way down we came to the first rock of the Gianida range called Teatro Piccolo (Little Theatre). There, panting and blowing we were glad to rest in a shallow cave or opening protected from the sun.

After refreshing ourselves with cold coffee, we again set out. We found the lower half of the declivity less steep and more thickly imbedded with volcanic sand. We had a better foothold, and found the descent less fatiguing. We finally reached that part of the Serra Gianicolo, called Teatro Grande (Great Theatre), a stupendous pile of stately basalt formation, its lofty summit being crowned with tufa. It is rectangular in shape. Its strata are horizontal, and it resembled a huge pile of finely split cord-wood. The Americans named it the "Cord-wood Pile." High up on the side of the south range, overlooking the ancient crater of Trifoglietto, a cluster of gracefully formed pinnacles shot upward into the sky. Together they resembled a great ancient castle with turrets, and walls, and donjon-keep. This we named the castle. The mountains that rim the valley are made strikingly picturesque by immense vertical ridges of dolomite and green stone, that stand out in bold relief like great ribs from their perpendicular sides. Two of these vertical ridges or walls, parallel and near to each other, reminded us Americans of the Devil's Slide in Echo Canyon; though they are much larger and grander, we, of course, called them the Devil's Slide.

On reaching the bottom of the valley we expected to find our mules awaiting us; but they were not there. We scanned the black dreary waste with our glasses. They were not to be seen. We hallooed, but no response came back save the echoes awakened from the lofty rocks which seemed to mock us in our distress. Our coffee and water were gone. We had wine, but this is no substitute for nature's beverage of pure sparkling cold water. We were weary. We were thirsty. What were we to do? We could not sit in this horrible pit waiting for mules that might never come. Far distant to the south, across an arm of the lava sea, we saw some green trees high up on a gentle declivity of the mountain. We resolved to make for this bright oasis. Miss Jones led the way, a trusty guide on either side. We ascended the lava bad. It was cruel, wicked and hideous in its black tortions. The lava in places, when hot, had twisted itself into the forms of great serpents, and then congealed to stone. Sharp, jagged points projected upwards assuming fantastic shapes not unlike animals or fiends as sketched by Doré. We would climb one great billow, surmount its ragged crest, then descend into the hollow; then mount another; and thus we crawled along like snails in our weary course. There was no music of purling

streams, or babbling brooks to cheer us and give us hope. There were no songs of birds; no sharp treble of insects, not even the chirp of a cricket, but everything was black, silent, stone-dead. Our hands were cut, our clothes torn, and our feet became sore. Our heroine's arms were black and blue where the guides grasped them in the descent. Some of our party began to murmur, but not a word of complaint escaped from her lips. I had planned the expedition and suffered remorse for leading my friends into this horrible valley to wander like condemned spirits in purgatory.

After toiling for a couple of hours in the midst of frightful chaos we reached the south shore of the lava sea. Three wolfish looking dogs dashed forward and with loud baying disputed our further passage. Their loud barking and hostile attitude gave us pleasure, for we knew their master must be near. He soon appeared from behind a rock, stormed off the dogs, and with looks of the utmost astonishment gave us a welcome. He was a shepherd, and a fine type of the Sicilian peasant. His long knit cap of blue hung downward, like a bag, from his head to his waist, terminating in a tassel. He wore knee breeches with stockings, a short jacket, and sandals of raw cowhide on his feet. He gave his name as Pasquale Cavallaro. His sheep and goats were reclining in the shade of the beech trees on the mountain side, the beautiful oasis we had seen in the distance. Among the trees a spring of pure cold water bubbled upward, but its limpid stream was licked up by the acid soil within a few feet of its source. Pasquale conducted us to his hut. It was roughly built of lava rocks, circular in form, and surmounted by a conical roof of thatched straw. Inside was a great open-mouthed fireplace. In front he had erected a shade with boughs cut from the beech trees, of which the leaves were still green. Beneath this bower we seated ourselves upon lava boulders, cushioned with goat skins. Limpid water cold from the springs slaked our thirst. An abundant repast spread beneath the leafy canopy appeared our famishing hunger. At once we were in good humor and happy.

We were seated upon the southern rim of the ancient crater of Trifoglietto. A great mountain peak rose perpendicularly 4,000 feet into the heavens above us. Upon its crest was a shepherd looking down upon the convivial feast below. At the base of the range a species of sorrel grows, and broom is sparsely scattered about. Pasquale's sheep and goats picked their scanty living from this vegetation. The Messina Consul had lost the soles of his shoes. The soles of mine were going "flippity flap" at every step and I was obliged to cut them off. Our heroine's little shoes were torn into fragments and looked like tufts of feathers, but what cared we now, rested and refreshed as we were, with the long-looked-for mules approaching in the distance? Our guides had found them a mile or two down the valley behind some great lava billows, where they had been awaiting us since early morning. Pasquale said he had never before seen foresteri (foreigners) in the valley, hence his great surprise. We made his heart glad with a few pieces of silver. We then mounted and were away, Pasquale saying: "I kiss the hands of the lady and the gentlemen. God bless your worships."

Our rough, stony bridle path wound along beneath the overhanging cliffs of Solfizio. We finally reached Mount Callana, flanking its base to the south. There we made a steep descent over great beetling rocks into the Callana valley below. To our right towered above us an immense lava cascade 400 feet in height. In the eruption of 1852 the lava poured over it in fiery sheets. When the eruption ceased the lava of the fall cooled and hardened to stone. The cascade and its lava sheets are as perfect as if carved out of the igneous rock by sculptors. From the valley of Callana our way wound through the Porteli, the east gateway (or exit) of the great valley, and we were soon among fruit orchards and vineyards. A sparkling stream, fed by the snow above, came foaming and purling in an open aqueduct, making joyous music in its course. We soon entered Zaffarano, a town of some 4,000 people, where we found our carriage from Catania awaiting us. We proceeded to the beautiful villa of Marana. The gate was flung open to us by the servants and we had a warm welcome into this hospitable domain. This villa is owned by Signori Nunzio Consoli Marano, a wealthy merchant of Catania.

Signori Marano is an ardent admirer of our great republic. He had placed his villa at our disposal. It is one of the most beautiful and lovely of all Sicily. A fountain was playing in its court. A great flower garden surrounded it. Myriads of flowers of every hue, from the pearly white to the deepest blush of pink and rose, were in bloom. Their sweet fragrance perfumed the air. Palm and other semi-tropical trees waved luxuriantly their broad leaves. An artificial grotto, embowered in ferns, was mirroring itself in a crystal lakelet below. Golden pheasants, with their beautiful plumage, added to the richness of the scene. Ætna, towering above us, was crowned by a white flossy cloud. Thus we had emerged from "Inferno" into "Paradise." Blackened, begrimed like chimney sweeps, we retired to the bath in our rooms. We came out clean and refreshed. Miss Jones appeared at the head of our dinner table entirely transformed. She did not in the least resemble our heroine of Ætna and Val del Bove. The Goddess of Liberty could not have presided with more grace than she did at our festal board.

In the beautiful parlor of the villa, we Americans were gladdened by a fine picture upon the wall of the President of the United States, and by a splendid photograph of General Grant in uniform.

Zaffarano, as above written, is a village of over 4,000 inhabitants. Its altitude above the sea is 1,748 feet. It has many times been shaken to the ground by earthquakes. Lava fields almost surround it. The views from it of Mount Ætna and the Solfizio Mountains are very fine and remind one of the scenery of the Alps. An earthquake a few weeks before had shaken the town. One of its churches was badly injured. We saw a large number of women carrying sand and stone in their aprons to the workmen. Thus they manifested

their religious zeal. American ladies are just as active for the good cause. Instead of carrying sand and stone in their aprons to the builders, they work faithfully in ways well known, and by their sweet smiles and winning grace open the purses of their less religious lords.

After dinner and a sweet rest in the sylvan bowers of the beautiful garden we set out for Catania. Miss Jones bore away a trophy of lovely flowers from the Mariano Villa. The full moon was wading through gossamer clouds high up in the heavens. A broad band of silver light was shimmering upon the placid sea below us. Our drive downwards through the orange groves and many villages was most delightful. We reached the Catania Consulate about 10 o'clock at night, and our excursion, so full of adventure and the wonderful, was ended. ALBERT WOODCOCK.

Kut-ai-Nah.

KUT-AI-NAH—No Chief—is a grim looking old Blackfoot who lives on the Two Medicine River. His features are not pleasing; his nose has been broken and is dished in the middle of its length; his chin is long, wide, protruding; his eyes have a cold, cruel expression; all in all, he is about the very last man one would suspect of having any kind qualities in his moral make up.

In the winter No Chief lives in a warm and comfortable log cabin; in summer he camps out in a lodge. Around the house is no litter of chips, old clothes and tin cans, such as is often seen in the dooryards of even white settlers; the grassy sward is clean and well preserved. In the house the floors are always spotlessly clean; the iron bedsteads are covered with clean blankets, quilts and pillows. You should see how neat the cupboard is; No Chief himself often inspects it, and with a stick rubs and scrapes the under rims of the tin plates where they are most apt to become discolored and rusty. His wives are always neatly dressed. He himself, when at home, wears the old time costume of leggings, breech-clout, shirt and blanket, but in a trunk or bureau is always a good suit of "white man's clothes" which he puts on whenever he visits the agency or the trader's store.

No Chief's face betrays his character. He is a most kindly man, good to his wives, his children and grandchildren, generous to the needy and afflicted, always advising the youths to lead sober, industrious lives. Moreover, he is a living example of my old friend the trader's oft repeated assertion that "you never can size an Indian up and tell what he is liable to do or not to do." For the old man has, and has had for more than thirty years, carefully put away in a fringed and painted parfleche sack the bones of a human skeleton. And the Blackfeet, understand, have a deep rooted dread—a terrible fear—of human remains; they believe that the ghost or spirit of the dead often returns to visit these remains of its earthly body, and always causes affliction of some sort, often death, to those who disturb or even camp near them. It is very odd, then, quite remarkable, indeed, that No Chief should keep these bones after having been raised in this belief. For years, whenever he traveled, the sack of bones was carefully packed on a led horse. In the lodge, in the house, at night and in bad weather, it has always hung suspended above his seat at the rear of the dwelling, and on fair days swung in the breeze outside, suspended from a painted medicine tripod.

I have known No Chief for more than twenty years; hunted with him, lived in the same camp with him for months at a time, but until recently I never heard of the skeleton he has kept so long and carefully. I scented a story at once, and rode over to his house, arriving there along in the afternoon. The old man welcomed me, gave me the seat of honor, filled his great pipe, and we smoked together, talking about the news of the reservation and other common matters. I knew better than to broach the object of my visit until after dark. In the daytime, as every Blackfoot knows, one must not talk of ghosts or spirits, or of the doings of the gods, else he will be stricken blind. But after the simple evening meal, when the candles had been lighted and the great stone pipe refilled, I got the story.

"There it hangs," said No Chief, in answer to my query, pointing to the sack hanging above him against the wall. "How I got it, why I have kept it, is in part the story of my life; you shall hear it."

"When my father died, he was killed in a battle with the Assinaboines, I was about twelve years old; my brother, perhaps two years younger, and my good mother composed our little family. As soon as it was known that my father was dead, his relatives came and took the horses he had owned, leaving us but one poor old travois animal. Our lodge was old, torn and leaky; we had but few robes to cover us; we were very poor. We had no weapons; the enemy who killed my father got them as well as his scalp. Those were very miserable times for us; my brother and I herded horses for some of the large herd owners; my mother tanned robes, embroidered moccasins and war clothes for the great hunters, and in that way we finally got another horse; the two could pack our poor outfit, and we were enabled to move camp, all three of us walking, of course. It is a dreadful thing to be poor. I made up my mind that I would not remain so long. The years passed and I attained the age when I would be permitted to go with the older men to war. I had gone through the long fast, my dream had given me good medicine. I had earned a bow and a quiver of good arrows. I was ready, impatient to start, to begin the life of a man. It was early in the spring that the chance came; I went with a party as servant to the partizan, carrying his moccasins and robes, his medicine sack and robe, waiting on him whenever we camped. I had not listened uselessly to the stories of my elders by the lodge fire for many an evening; I knew what to do and was prompt to act; the partizan was pleased with me and very kind. At last, after many days' travel, we discovered a great camp of the enemy on Little River (Milk River), in the long timbered bottom where it joins the Missouri. We cached among the cottonwoods and willows all that day, and when night came the partizan instructed us. He said that we should all go into the camp, each man for himself, remembering to be very cautious, very quiet, to take no chances of discovery by hurried work, for the lives of all depended upon the actions of each one. Yes,

I was allowed to go in, too, instead of waiting at the place it had been agreed that we should meet, as a servant is generally required to do in order to help hold the horses as they are driven in. I was not much afraid when I entered that great camp. I thought of my poor mother, of my brother, of the hard life we had led. I determined to take all the horses I could, for their sake as well as mine. I would be very careful, but if I was discovered—well, I could die. I entered the circle of the village, praying my dream to give me success. The fires in the lodges had long since died out, and the people slept; here and there I could hear their loud snoring as I passed along. 'Remember,' our partizan had said, 'not to prowl around too slowly, nor to crawl, nor go stooped over, lest the dogs become suspicious of you and give the alarm.'

"Well, there were many horses picketed in that camp, all around between the lodges. I cut the ropes of two and led them to our meeting place, where I tied them and returned for more. I made three trips and got six head in all. My companions had done much better, taking, some of them, as many as fifteen. I wanted to go back once more, but the partizan gave the word and we started for home, driving the band before us, at first slowly, and then, when beyond hearing of the enemy, as rapidly as possible, often stopping to catch and ride fresh horses. The Assinaboines, when they discovered their loss, may have followed our trail; most likely they did, but we never saw them. There never was a prouder and happier youth than I was when I rode into our camp and gave my mother and brother the horses I had taken, reserving only one for myself. 'The days of our poverty are over,' I told them. 'I can now run buffalo, and we will have a plenty of good robes and meat. I will go to war again and again; we will own a big herd.' My mother cried from joy at my words and embraced me.

"Hai-yah! It was not to be as I had said. I have long since learned never to say, I will do this or that, but I hope to do this. Sometimes, no matter how deserving we may be, the gods seem to forsake us. But a short time after I returned I was stricken by a very painful disease; my feet swelled up, I could not sleep, I could not walk; I could do nothing but suffer. In vain the doctors and medicine men strove to cure me; they could do no good, and I suffered; oh, what terrible pain I endured, not for a month, nor a winter, but for three long years. My brother and mother were more than kind; they helped me in and out of the lodge, laced me on a travoi when camp was moved, did all they possibly could for my comfort. With my bow and arrows, riding the swift horse I had taken, my brother kept us well supplied with buffalo hides and meat. In the second summer of my sickness he had grown to be a tall strong youth, and in turn he went to war with a party, servant to the partizan as I had been. They went southward to the Yellowstone country in search of the Crows. Each day of their absence, as the medicine man rode around through the camp calling out their names and reminding the people to pray for their success and safe return, we cut a notch in a stick to mark the time of their absence. Those days seemed very long; my mother and I worried so much that we could scarcely eat; from the very first day we feared the worst. At last, one afternoon, the party returned, not riding joyously into camp astride horses of the enemy. No; they came in afoot, silently, slowly, what there was left of them, and my brother was one of the missing. His body lay on the banks of the Yellowstone; the Crows, surprising the party, had killed him and four others. This was a terrible blow to us; my mother nearly died of grief. I don't know how we got through the next few months; it was a very miserable time. Early in the following winter, after I had about given up hope of ever being well again, my feet began to improve. I got up and walked. Slowly and for a short distance at first; then more steadily and further, until by spring, strange to say, I was as sound as ever, and able to take part in the hunt.

"It was sometime after the grass became green that a party was made up to go against the Crows, and I joined it. It was the opportunity I had been looking for. Two of my companions had been members of the party my brother had joined, and when we arrived at the Yellowstone they pointed out to me the battle ground and the place where my brother had fallen. I went to it and found his remains. Strange to say, the wolves had not disturbed them; every bone was there, a little dried, hard flesh adhering to some of them. The Crows had taken his clothing, his weapons, even his beaded necklace. 'Brother,' I said, addressing his shadow,* which I felt sure was near, 'I am not going to leave you here in the land of the enemy. I am going to take you home, and care for you, and when I die you shall be buried with me.' And with that I gathered up the bones, tied them in one of my blankets, and rejoined my companions. 'What have you there?' they asked. And when I told them, they were surprised and angry. 'Drop them,' they said. 'Don't you know that you will cause us bad luck of some kind? Leave them at once, and the blanket you have wrapped them in, and wash your hands good, rubbing them with the purifying sweet grass.'

"I refused to do so. 'It is my brother,' I said. 'He was good and kind to his mother and me, and I am going to take him out of this country of the enemy.'

"Then you will travel alone,' said the partizan. 'We cannot risk having this ghost with us; it will surely bring bad luck to some, perhaps all, of us. Drop it at once, or leave us.'

"I turned away at once and went into the timber bordering the river. I could not blame them for what they had said; I was not angry, but I felt very sad. Deep in the thicket of willows and briers I built a little war house of dead poles and brush, and there I remained three days, cooking my food at night, the meat of a deer I had killed, sleeping much and resting. I wanted to give my friends plenty of time to find the camp of the enemy and get out of the country before I started forth. On the third day I built a small raft of driftwood, lashing the logs together with strips of deer skin. I left the skeleton in the war house. 'Brother,' I told him, 'I am going to avenge you. I will be very careful and return as soon as I can, and then take you home with me.'

"The moon had risen when I pushed the raft out into the current and floated down the river. It was nearly as light as day, and I had no trouble to see the channel

ahead; the trouble was to keep the raft in it, for often I could not touch bottom with my pole. All that night I drifted along, listening for the barking of dogs, the neighing of horses, looking for water trails along the shore, but I heard nothing save the howling of wolves and the owls hooting above the murmur and roar of the bank-full river. When morning came, I ran the raft ashore on an island, went into the willows and slept. Along in the afternoon, having slept and rested and eaten some of the cooked meat I brought along, I climbed one of the tall cottonwoods on the island for a view of the country. Away below, at a bend in the river, I saw some horsemen riding down into the valley. There was no game in sight, no buffalo, not even a band of antelope, and I concluded that the Crow camp was there by the river where the horsemen were heading. As soon as night came I went across to the mainland and walked down the shore in that direction. It was not long before I heard dogs barking and howling in answer to the wolves out on the hills, and then I saw the camp, a very large one, pitched on a broad open flat and along the edge of a belt of timber fringing the river. I got into the timber and went carefully down through it. I had no plan, and went to see whatever was to be seen. I was opposite the center of the village and only a few yards from the nearest lodges, when I saw a man come out of one of them, pull his robe well up about his face, and come toward me. I stood still in the deep shadow of the brush and watched him pass on a path that ran toward the river. As soon as he got by I followed him, stepping lightly but quickly. Just as I was about to jump on to him he turned, saw me, and we grappled each other. He had good strength, but I had more; I got one hand on his throat so he could not cry out, and with the other drew my knife and stabbed him. He had got out his knife, also, and slashed me here on this arm, but it was not a bad cut. Before he could strike again I felt him shiver, and then he fell back, quite dead. I took his scalp, his knife and belt, and went back toward the upper end of the camp. Fires still burned brightly in the lodges, and I could hear the people talking and laughing. There were some horses tied near a lodge which was pitched close to the timber. I knew I was running great chances, but I walked out there in the bright moonlight and cut one loose, leading him back into the timber without being discovered. I kept leading until I had passed the bend and was out of sight, and then I mounted and rode swiftly away up the river. He was a good, finely paced horse. About daybreak I got back to my war house. 'Brother,' I said, as I entered and took down the sack, 'Brother, you are avenged. I have killed a Crow, here is his scalp, and now for home.'

"I arrived there safely, and the people were greatly surprised, for the rest of the party had returned and told them about me. Even my mother did not expect to see me again. That was thirty-three years ago. Ever since I have kept and cared for these remains of my brother, and the time is now not far off when we will lie down together. No, in all this time he has never appeared to me, never spoken to me, and I think this is strange. In times of doubt and distress I have thought that he might come to my aid. After all, it may be as the white men say: that there are no ghosts; that when a person dies his shadow departs from it and from this world, at once and forever. I have had my share of trouble and bad luck since I brought my brother home. One of the women I afterwards married is dead. I have lost three children. One time when I was in a battle I captured an enemy, a young man, and was going to kill him, but he pleaded so hard for his life, making signs while the tears streamed down his face, that I let him go. When criney (first son) was born I named him Sai-kim-ai-kim-Takes-pity-on-the-other-side, in memory of this incident. I thought that it would be a lucky name; that my boy would do well under it—would live to great age. But when he had attained the age of young manhood he sickened and died. Oh, that was terrible, and most unjust. On the other hand, I have prospered in many ways. My mother lived to great age. I have grown sons and daughters, good, kind, well-to-do. I have more than a hundred head of horses, and have sold hundreds, living comfortably on the proceeds. No, I do not think that my brother's shadow has brought me either evil or good.

"Shall we smoke another pipe? No? Well, then, my wife shall spread you a couch here, right beneath my brother. I know you are not afraid. You white men do not fear anything—ghosts nor the under-water-people. Sleep well."

J. W. SCHULTZ.

An Appreciation.

Editor Forest and Stream:

I would ask to correct a statement which I made recently in regard to the number of deer which the late law in this State allows one person to kill in a season. Instead of it being ten, as it read, it should have read two, which sounds more reasonable. The mistake was made through a misprint in the report, and I am glad to make the correction.

I have been so highly gratified in the reading of the reminiscences of the long ago by Cabia Blanco and J. W. Schultz and others, that I feel inclined to express my appreciation of their contributions. No particular class of contributors so intensely interests me as the reminiscences of the old timers who have been active participants in the stirring events of the days of the buffalo, Indians and the frontier life in general. While still a few of the old survivors of the early days are with us, we should encourage them by every possible means to give as much as possible of their past experience for publication, that those who come after may know something of the pleasures as well as the hardships of those who opened up the way. After opening the FOREST AND STREAM and reading the editorial page, I leaf over the first thing to see what the old timers have called to mind of their past; if nothing of the kind appears, I am disappointed, in spite of the many other good things which always appear.

EMERSON CARNEY.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

* Blackfoot equivalent for ghost or spirit.

Natural History.

The Little Zoo.

SOME people call it the zoo-zoo. It is situated in Prospect Park, Brooklyn, and is so modest and retiring that you would hardly ever find it if you had not been told the way.

For the information of strangers, it may be noted that it lies to the northeast of the merry-go-round, in a dip in the woods. But the merry-go-round—where is that? Well, you do not need to be told; you will hear the merry-go-round. It will strike your ear afar off—and strike it hard.

From this grand center of attraction it is only a hen's race to the little zoo. I like to stroll there of an evening, as I did last evening of all.

The day had been hot—swooningly hot—but now the sun had set and a cool breeze was rustling the trees.

Under the influence of this the gray wolf got up and shook himself; the coyotes whisked their tails and ran about as if in search of a trail; the ocelot stood to attention with fiery eyes; the two bear cubs came down from their shelf and began to practice climbing; the raccoons rolled about in play like jolly schoolboys; the foxes sat on their haunches and cocked their ears with the most innocent air imaginable; the porcupine did a two-step with his hind feet while reared against the wire grating of his cage; the monkeys cried "Murder!" and pursued one another from swing to swing; the big black bear took to pacing up and down beneath the rocks, with his tongue out panting; the buffalo and the deer nuzzled in the newly-filled hay-racks; the peacocks set up a caterwauling among the trees, and the eagles clapped their wings and screamed. Only the coati mundi seemed indifferent to the change in the weather and the approach of night; he lay doubled up in the corner of his cage apparently fast asleep. But perhaps the coati mundi wasn't feeling well.

With his back against the bear's cage stood Mike, the keeper, chewing tobacco. His mien was that of a man taking his ease after a hard day, and I could imagine him quoting Spenser to the following effect:

"Sleep after toyle—port after stormie seas—
Ease after warre . . . does greatly please."

All day long he had had to be on the alert to keep the children from poking sticks at the animals or feeding them with candies or other things not exactly suited to animal digestion. And the day had been so hot, too. But now the children had gone home and a cool breeze had sprung up and life became endurable once more.

"Well, Mike," I said, after bidding him good evening, "are you still of the opinion that wild animals are not dangerous?" "I am that," he answered. "They're a big set of cowards. But they're treacherous, and you want to keep the eye in the back of your head wide open in dealin' with them, 'specially in the ruttin' season. Last fall me side partner, John, and me were in the deer yard when all of a sudden the big bull elk commenced to stamp and snort and glare at us. 'Clear decks for action, John,' says I, 'for there's goin' to be war.' The words were hardly out of me mouth when the elk made a charge at John and knocked him gally-west. I had a pole with me, by good luck, and I gave the elk a few jabs of it and he retreated a bit, but still showed an ugly front.

"Poor John lay all of a heap, groanin', and I was in mortal fear that the elk would charge him again before I could get him out of the way.

"Keepin' my face to the inimy, I backed up to John quick as I could and took him in me arms and laid him behind a big stump.

"Not a minute too soon, for the inimy was chargin' again. I met him with the pole, but sure I thought it was a man-o-war I was tryin' to stop. Well, sir, I went over, but as I did somehow managed to catch the elk by the horns. I held on till a policeman—"

Here he eagle screamed loudly.

"Of course," I said, "the policeman arrested the elk and arraigned him in court. Quite right."

Mike looked reproachfully at me, but before he made any reply a dreadful commotion arose suddenly in the buffalo yard.

"There, that scald of a peacock is at it again!" cried Mike, excitedly. "She'll kill him yit, so she will."

"Kill whom?" I inquired.

"Why, the buffalo. Didn't she do him up in three rounds the other day?"

He started hurriedly for the buffalo yard, with the chronicler at his heels. Arrived there we beheld a truly remarkable spectacle. The buffalo, a great mountain of an animal (he is one of the largest in captivity and the pride of the little zoo) was in a rage, with head lowered between his forelegs and fire blazing from his eyes. Facing him was a peacock, with head outstretched snake-like, ruffled feathers and all the appearance of a true gamebird with its blood up.

With a snort the buffalo would make a rush at his antagonist; this the peacock would dodge, then with a fierce scream would fly up and hit the buffalo in the nose with its spurs.

Mike shouted objurgations at the peacock, but I entreated of him to be still, and the fight proceeded until the buffalo began to get winded, when he turned tail and went over to a corner and lay down sheepishly. The peacock erected its head, glanced about (as much as to say: Is there anyone else looking for a fight?) and then marched off with the air of an Egyptian queen. It all reminded me of a contest between a great stupid man and a subtle, adroit female.

"I think I know now," I said, "why the peacock's feather is worn."

"Well, you don't find me wearin' it," said Mike, with emphasis. "No, sir."

"Why," I inquired.

"Because it's unlucky. I knew a man got run over by a trolley car and another that lost all his teeth through wearin' it."

"Are you sure the man that lost his teeth hadn't been going to a dentist?" I asked.

But Mike made no answer, being terribly in earnest, and I could not help smiling at his faith in the old superstition. It would be interesting, by the way, to know the origin of this. Can the evil eye have had anything to do with it?

A brief silence ensued, an occasion for breaking which was the appearance of a veritable rara avis, namely, a white peacock. This bird was donated to the little zoo some time ago by a lady in South Brooklyn, and is an object of much curiosity, especially among the fair sex. However, I am apt to think that the sight of the bird must cause a little disillusionment. When I saw it it looked as if it sadly needed a bath, while one of the tail feathers was loose and trailing on the ground. But it was interesting to note the colorless ocelli and other markings of the plumage.

Mike told me that the albino, as if conscious of its singularity, kept very much to itself among the woods, where he believed it had a nest. He set out one morning to find the nest, but the bird, after leading him about all day, left him no wiser than when he started. "Fox & Peacock would make a fine name for a Wall street firm," said the droll Mike.

There now arose on the evening air a bleating of sheep and lambs—what sound more peacefully rural and grateful!

"Ah," cried Mike, "there's little St. Patrick and his flock."

"Little St. Patrick," alias O'Hara, is the park shepherd (whom I had the honor of introducing on a previous occasion to the readers of FOREST AND STREAM). His sobriquet he has earned by reason of his crook, and it suits him very well, for his exterior is certainly benevolent, if not saint-like, and I am sure he loves his flock.

I followed Mike around to the fold and saw the flock filing in. The lambs are quite numerous this year, and among them are a black one and a brown one, of strange goat-like appearance, the offspring of a Brazilian dam.

Now, within the fold is something which caused me to start violently the first time I saw it. This is nothing less than a cage containing a big cinnamon bear. What, I thought, if that bear should break loose at night? I marveled how the shepherd could rest from thinking of the danger which lay so close to his beloved flock. At least, I thought he must have horrible dreams, and I imagined him starting up at night exclaiming: "The bear—the bear! Save my sheep!"

I mentioned the matter to O'Hara, and he admitted he had thought of the danger, though he wasn't sure he had dreamed of it. "But," he added, "sure God is good, sir!" Not for nothing has he been called "Little St. Patrick!"

It was beginning to get late. The eyes of the owl were glowing like two candles, and the animals for the most part, night prowlers though they were, had sunk into listlessness or slumber again, mournfully conscious, no doubt, that there was no opportunity for the play of their faculties, the doom of imprisonment being theirs.

I wished O'Hara good night and Mike a quiet watch and took my way down the hill and through the glen. Only the murmurs of waters broke the midsummer silence, while the fireflies were flashing in the gloomy recesses of the woods. At this hour of the evening the scene reminded one of an Adirondack wilderness.

FRANK MOONAN.

The Intelligence of the Wild Things

Editor Forest and Stream:

If your correspondents would carefully read my communications to FOREST AND STREAM they would save themselves a lot of useless argument.

It was claimed in the Atlantic Monthly that "No bird teaches its young to fly. No bird teaches its young to eat or sing. No bird teaches its young to do any of the things which its parents do and did. No animal chastises its young."

These sweeping assertions, if true, would deprive the lower animals of all intelligence, and leave them subject to a miraculous power, called instinct, by the man worshippers.

Believing fully in the intelligence of the lower animals, I picked up the gauntlet and endeavored to prove that animals do chastise their young; that birds do teach their young to eat, sing and fly. In no article is it claimed by me that birds would not eat, sing or fly without a teacher, yet my critics use this as an argument, and one goes so far as to claim that I do not believe birds could walk without a teacher. Such senseless arguments are not instructive and become tiresome with repetition.

I am also admonished to remember that animals inherit many attributes, which should convince me that all necessary to existence are inherited. While I do not fully agree with my critics in their claims, I go beyond them in accepting some inherited traits. I believe that acquired characteristics are inherited, and it would be hard to find a non-believer in the intelligence of the lower animals, who will admit that. Years ago I combated in FOREST AND STREAM the claim that the daily acts of the lower animals was the outcome of a supernatural power—that meaningless, illusive shibboleth called instinct.

Long before Buffon was forced to recant his published views of nature, the idea, conveyed by the word instinct in the English language, was invented to separate man from the lower animals. Man possessed a soul. The lower animals were soulless, and when an intelligent act was performed by one, it would not do to call it reason, so the word instinct was invented.

Webster's Unabridged defines instinct in various terms, but he quotes Sir W. Hamilton, and doubtless his is the accepted meaning of the word.

"An instinct is an agent which performs blindly and ignorantly a work of intelligence and knowledge."

This definition covers the ground fully. Now as to reason. Thought underlies reason. To think is to reason. It is a simple matter to understand reason when we use it in our everyday lives. Three things are necessary to human existence. Food, clothing and shelter. With these necessary wants in view the farmer reasons over his crops and domestic animals. The doctor reasons over his

patients. The lawyer over his clients and the merchant over his ledger, and the end to be accomplished is food, clothing and shelter. The lower animals need only food and shelter, nature has kindly clothed them. They reason over the routine of their daily lives as well as man.

Science teaches us that the power to reason by man is dependent on certain wonderful organs. And, strange to tell, science teaches us also that the same wonderful organs are possessed by the lower animals. Their power to think, to reason is thus assured. When we see any one of the lower animals perform an intelligent act, why not judge it just as we would if it had been performed by a human being?

I would say to your correspondent, I. W. G., that the deposing of instinct, to which I called attention, is not the dream of a visionary. It is a fact that scientific writers are dropping the word instinct, and are using heredity instead. The latter is the better word, for it makes intelligible all that instinct implies without a resort to the supernatural.

Your correspondent, A. H. Gouraud, mentions my boyish observation of a mother cat's efforts to teach her kitten how to catch mice, and then quotes Darwin to prove that a kitten will growl over a mouse without a teacher. I do not doubt Darwin's statement, but it is the exception and not the rule. For ten years I carefully observed a cat that belonged in the store where I got my breakfast. This cat educated her kittens as all cats of my acquaintance did and do, except to catch mice. The old cat did not eat mice, did not catch them, either. Year after year, having Darwin's statement in mind, I fed dead mice and live mice to the old cat's kittens. Some of the mice were from the woods and some were caught in the store. The kittens, with a few exceptions, did not growl over a mouse, did not try to eat a dead one or try to catch a live one. Some of the kittens would play with a dead mouse, cuffing it about as it did a spool or marble. The old cat, I was told, did not see a mouse in her kittenhood, and while in the store was fed more meat than she could eat, so had no appetite for mice. She evidently thought that her kittens would be housed and fed; and would not be forced to work for a living, therefore she did not teach them to catch mice. The children of the rich are seldom taught a trade, and pussy, in not teaching her young to work was following the example of the higher animal.

I had observed cats and kittens from my boyhood up, but it remained for this grocery cat to teach me something new, in the way of cat communication.

Usually Mr. Wilson gave the kittens away. A few litters were drowned, but when the cat was quite old a kitten was selected to take her place in the store. The cat and kitten were fed meat every morning at the door from a meat cart. The driver of the cart, in return, received a cup of coffee. Cool mornings the cat and kitten hugged the stove, but when it was time for the meat cart the old cat hopped on to a show case, where she could look up the street and see the cart when it turned the corner. The sound of wheels would cause the kitten to wake up and look toward its mother. If it was not the meat cart approaching, the old cat would lay her ears back slightly. The kitten would doze again until wheels were heard as before. If it was the meat cart the old cat would prick her ears forward and the kitten would instantly become active. She would rush to the door and wait until it was opened. The old cat would remain on the show case until the cart reached the store, when she would jump down and go to the door, but did not get excited like the kitten.

Now Messrs. Doubters, what are you going to do with this case? As it can be proved by many observers, it must be accepted and dealt with as true. Let me sum up the lesson which it teaches:

In the cat language pointing the ears backward means no. Pointing the ears forward means yes. The arrangement was thoroughly understood by the cat and kitten, and when wheels were heard the kitten looked to its mother for information. If the answer was no the kitten understands its meaning and dozes while the cart goes rumbling past. If the answer is yes the kitten rushes to the door fully understanding that this cart will not go past like the other. Here we find intelligence, communication and reason, and here is conclusive proof that the old cat taught its kitten the cat language. The kitten could not have inherited a knowledge of a meat cart, even if it could inherit the knowledge of a mouse, as Darwin intimates.

As to signs made by the ears, I remember that in my boyhood days a hunter that was called half witted taught me that all animals with protruding ears used them to talk with. Observation since that time has convinced me that the dog, horse, cat, raccoon, fox, rabbit and deer communicate with their kind through the motion of the ears.

One more cat story that I have already mentioned in FOREST AND STREAM, and I shall drop cats from this discussion.

While going through Mr. Seth Cole's greenhouse with Mr. Gilmore, the foreman, I noticed that a cat followed us about uttering a most unearthly yowl. I asked Mr. Gilmore what it meant. "The cat is hungry," said he, "and it has some trouble with its throat, so it can only make one cry." I examined the cat's throat and found it all right. Mr. Gilmore gave me the history of the cat. He had found it on the doorstep before its eyes were open, and had brought it up on milk fed from a teaspoon. The cat had never been out of the greenhouse and had never seen another cat. I suggested that the cat needed a teacher, and Mr. Gilmore tried the experiment by putting another cat into the house. Two months later I heard the waif mew in the proper cat language. The savage yowl had become the gentle mew of an educated cat.

I will now call attention to some of the vagaries of this discussion: The hooded chicken is one. Years ago I had read the experiments mentioned by your correspondent, A. H. Gouraud. I do not take stock in any experiments where the animal is unnaturally handicapped. The chick, when unhooded, ran to the hen for food by sound, without doubt. It had heard voices when fed and would be likely to associate sound with food.

Your correspondent, I. W. G., makes much of the bawl of a frightened calf, which brings the nearby herd to the rescue. Then sums up as follows:

"The newly born calf is endowed with a language

which is well understood by its species. The circumstances of the case make it impossible to entertain for a moment the idea that it has received a knowledge of that language by instruction."

It seems strange to me that a writer of the ability which I. W. G. possesses, will neglect to do a little thinking before committing a theory to paper. It is not language but tone that brings the herd to the rescue of the calf. Even I. W. G. could recognize the note of terror in the calf's cry, although he might be wholly ignorant of the bovine language. Nearly all of the lower animals possess the power to modulate the voice, to express many of the emotions which are common in the human family. The shriek of a frightened woman does not carry a word in any language, but it is immediately understood by the startled hearer. Terrors can be expressed without language, and the young of most mammals are born with this power. It is nature's provision for the protection of her helpless children. All the mammals inherit an impulse to seek food, which is another of nature's ways to tide the helpless atom of life over the danger period. These inherited functions are out of place in this discussion. There is no dispute on this line, and the writers who waste time and space over the subject are knocking down men of straw which they first set up.

Most birds, at birth, are as far along on the journey of life as a child would be when three years of age. The birds that are covered with down when born, such as the chicken, quail, grouse, etc., are checked by a few hours only of helpless babyhood. The birds that are born naked and blind, such as the robin, thrush, sparrow, etc., have to pass several days of helpless babyhood. My observation has proved to me that fear is inherited, but its action does not begin until the bird is beyond its babyhood. The birds that are born naked and blind do not show fear until they are able to fly. The young birds, while in the nest, show intelligence in some ways. When it is cold young birds will snuggle down in the nest. When they feel the heat they will separate. I have seen young catbirds call the mother bird's attention to the attached excrement sack, while its mates were being fed. The bird did this by elevating its body in such a way as to make it evident to an observer that it desired attention.

Sixty feet from my new cabin there is a catbird's nest containing four young birds, nearly ready to fly. To-day I passed one hour at the nest to observe the old bird's method of feeding her young. She fed them twelve times in fifty minutes. Five times she fed on doughnut from the dooryard. Twice young wood mice were dissected and fed to the birds. Insects were fed five times, mostly large winged ants. I don't know where the bird got the two wood mice. When the mother bird approached with food four yellow mouths were thrust up on long necks, but two each time received food, and no more. The mother did not make a mistake in feeding her babies. All were served in turn, although four open bills stared the mother in the face each time. The old bird did not feed doughnut until the young were ten days old. The towhee buntings feed doughnut to their young the second day, one meal in five. How do these little mothers know the nature of the strange food, so that one will not feed it for ten days, while the other begins at two? These birds feed their young on the same insect food. There is reason back of such intelligent discrimination. While I remained at the catbird's nest the mother bird inspected the nest three times. Twice she found and carried away a sack of excrement. An hour's observation of the thoughtful care of this little mother ought to convince anyone, not inoculated with the views of instinct, of the bird's ability to think and to shape action thereon.

A year ago three young towhee buntings were reared and brought to my dooryard. This was the second brood, the first was destroyed by crows. The adult buntings were old friends of mine. The young brood consisted of one female and two males. All returned in the spring migration, which was unusual, for these birds are shot in the Southern rice fields. The first nest, which the crows looted, was under a clump of viburnum shrubs. The second nest from which the three birds were reared was placed under a patch of catbrier, where the crows would not seek it. The young birds were kept under the catbriers until their wings were strong enough to fly, then they were brought to the dooryard for food and protection. As the birds had been confined in close quarters, and could not practice their wings, their ability to fly was limited. The little mother saw this as soon as her brood was established in the dooryard, and applied a remedy. She would take a piece of doughnut and fly to a low bush and call the little ones to follow. Before they had time to alight the mother would fly to a higher bush, keeping up the game until the young birds would no longer follow. In this way they soon got to be fair flyers. This method also made them proficient in dodging an enemy. I thought that placing the nest under catbriers was a cute thing to do. Perhaps the birds got the idea from the rabbits. On the south side of my new cabin, beginning not six feet away, is a dense patch of the catbrier. Rabbits have cut a path to the center, and when pursued by dogs dive into this retreat. One rabbit ventures out when my visitors bring dogs, and many a fool dog has met his Waterloo in that patch of catbriers. When the buntings returned this spring the young female was not mated. At the end of two weeks a strange young male appeared in the dooryard and he proved to be wife hunting. Before three days had passed the pair were mated.

The two young males disappeared during the nesting season. I suppose they had found mates at a distance. The females select the home, and it is usually near their mothers. Within a week one of the males has been to the dooryard three times for food. Some wretch had shot away one of his legs, and he found it difficult to procure food, so intelligently resorted to the dooryard, where he knew that he could find an unlimited supply. Soon after the young female was mated I saw her and her mother hopping in and out of a brier patch. Eventually the young bird established her nest in this patch, advised, as I believe, by her mother, who fully understood the need of protection. The old bird did not select a nesting spot for some time. The spot selected at last was in a valley under a patch of catbriers. The young bird hatched out four chicks. She fed them in the same way, and on the same kind of food that her mother had

fed to her. When the little ones were large enough to fly they were deprived of a mother's care and teaching. The mother was captured in my dooryard by a chicken hawk, *Accipiter cooperi*. The foolish bird darted behind some boards that stood by the cabin, but instead of remaining there, she made a break for the thick shrubbery on the south side of the cabin. The hawk caught her, and she cried pitifully to me for help as he bore her away. It all happened so quickly that I had no time to render assistance, and, besides, I had seen the birds escape so many times that I deemed it impossible for a hawk to catch one in my dooryard. I carried food to the motherless birds and hoped that they would remain under the protection of the catbriers. The next day I found them scattered about in a blueberry patch. The third day the crows got sight of them, and before the end of the week they had disappeared.

The old bunting during that week had brought out four young birds, three females and one male. The birds are about my dooryard while the mother is laying eggs for a second brood. The young birds were taught to fly as those were last year. Besides this innovation, the mother bird has adopted another. Before the crows were dangerous the first brood, when large enough to fly, was turned over to the male. Now the female will not trust the young to her husband's care, but looks after them herself and teaches them how to fly and eat before she deserts them.

Not far from my new cabin a pair of chestnut-sided warblers made a neat nest in the forks of a clethra bush. There was a large patch of these shrubs which protected the nest from view. The severe storm that ended the drought taxed the powers of these little birds to the limit. To feed the babies during a whole week of storm was bad enough, but when the gale prevented feeding and required the full strength of both birds to protect the nest it seemed a hopeless case. I visited the nest when the gale was at its height. Some trees were uprooted, and the air was filled with great and small branches from others. I found both birds on the nest. They stood on opposite sides with their wings spread and locked so as to protect their babies from the pelting rain. A fierce gust of wind would level the clethra shrubs to the ground, but the little birds bravely clung to the nest, chirping encouragingly to each other. I returned to the shelter of my cabin, and that night while the gale increased, my heart was filled with sorrow for the two dainty beings that were battling with the elements, not to save themselves, but to save and protect their dear ones, fired by the same love and devotion that thrills the human mother's heart.

M. A. WALTON (HERMIT).

Intelligence of Chicks.

Editor Forest and Stream:

In your issue of June 6 M. A. Walton (Hermit) takes me to task severely for owning chicks that do unnatural things and for saying various other things which he does not believe.

Mr. W. first takes me to task for bringing my chicks into the house, after asserting that the mother does not teach in any sense of the word. Well, I did not do it. I never raised a chick in my life; it is the other member of the firm that does these sort of things. Still I believe I know more about chickens than Mr. W., judging from his own account, notwithstanding his long experience. Young chicks require warmth and food; hence the mother's natural instinct to hover and feed them. A hen is liable to leave the nest or trample on some of the chicks before the eggs are all hatched if the young chickens are not taken away. To avoid this the chicks were brought into the house. Mr. W. accuses me of having a super-intellectual breed of chicks because they eat the first day and without teaching. The charge is groundless. All chicks will eat the first day, and without teaching. While it is undoubtedly true that chicks do not need food for 24 hours after being hatched, yet they will eat and pick up anything dropped before them, even if they do not eat it, to the extent of picking at each other's toes and causing many an upset. They will also notice and pick up a very small bug, but a larger one caused them to back off and "cheep" in some alarm.

A calf must be taught to drink out of a bucket, because it is an unnatural way for it to get its food, but dropping things before a chick is nature's way, hence requires no teaching. Some broods at hatching are brighter than others, but all will do all the things described within a few hours if they are healthy. This is not a case of "It's that way in my book," but chickens all over the world will do it.

Fad and fashion control a great many things, but they can't control bird nature. Mr. W. doubts that a bird flew by the window just in time to prove a statement that was to appear in FOREST AND STREAM. To prove that this was not a miracle, I will state that the boys have counted upwards of sixty bird nests on the place, mostly clustered close round the house. Add to this 100 English sparrows that are crowding in everywhere, and it is apparent that a bird flying by the window is not an uncommon thing. Even now a Texas orchard oriole sits just outside the window, not two yards off. He is pulling at a string put there for the morning glory vines to climb.

As to old roosters teaching the young to crow, Mr. W. admits that the old roosters do fight the young away at first, but later teach them to crow. I still had the paper in my hand after reading this when a rooster crowed. I went out to see the teaching process. I found the old rooster occupying the center of the field, teaching, while the young received the lesson from the far outer borders. If the young made an attempt to crow they immediately moved further out. This state of affairs will prevail until the young rooster has grown spurs long enough and sharp enough to maintain him in his proper place in society. Roosters crow at all times of day, more noticeable just before daybreak; but they will crow at midnight if a match is struck in the kitchen or other sound made to indicate that people are astir.

In a recent issue of FOREST AND STREAM Mark Hop-

kins suggests that my country is too closely settled to make the study of a wolf's tail a success, but that in his country it is an easy matter. Now let us see. Thirty years ago, commencing this fall, I spent six months in the Nebraska sand hills (Sandy Griswold's country. How I would like to pat his head and bless him just for the memories he has raised). The nearest settlement was at Loup City, more than a hundred miles away, and that was only a few weeks old. I had heard of the sand hill country and what could be found there through Major North, then of the Pawnee scouts, and (indirectly) Buffalo Bill. The information thus gained resulted in the six months' sojourn there. Wolves were very plenty and we got a great deal of music from them, but I have hunted day after day without seeing one. Mr. Hopkins speaks of seeing wolves hunting cottontails in a plum thicket. Out in the Dismal River sand hills I saw a similar sight, only that the game was elk. They got one, too. I had a good chance there for rather close observation, but the wolf tail question had not come up then, and I was too excited to note that they had their tails with them until I found one on the hide of the one my companion shot. That was the one event of that kind in a lifetime.

In 1896 I visited that country and found the wolves still there in increased numbers. They howled more and I saw them oftener than I ever did in the old days; but the chance for close study was "small."

Only a few years ago I traveled all over the Kiowa and Comanche country and over the line into Texas, perhaps to the very ranch where Mark saw those wolves hunting. In that trip of three or four weeks I heard wolves howling often, but I never saw one on the trip. Of course, I see how it is possible to take a close look at a wolf that is acting natural by the aid of a good glass and good luck, but I would not engage to do it in six months' continuous effort, and where I fail in that line there are few that succeed. Wolves that see the hunter or know of his presence before being seen, of course don't count. No, some other theory for the disappearing wolf must be brought out.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Teal Hole.

PERCHED on the edge of a bluff, and overlooking a broad expanse of marsh that wound in a green and sinuous ribband between stubble-grown mesa lands, stood a small rough-boarded cabin, of a size just sufficient to contain a bunk room, gun room and kitchen. Seated at a table in the gun room (which served also as living room, smoking room, library and the rest of it) on a certain winter's evening were five jolly good fellows and the Duffer. All six a unit when it came to wild fowl shooting, and all able to give a good account of themselves in a duck blind. The day had been a successful one, as the laden boughs of a tree near the cabin proved, where bunches of mallard and teal swung in the afternoon breeze.

The team was at the door to drive us to the station, and one by one the boys arose to gather their guns and traps together. Kenneth and the Duffer walked to the door and looked out. Far down in the west, almost touching the horizon, the flaming sun was sinking into the blue Pacific, the distant booming of whose breakers, dulled by the distance, sounded like the music of a sea shell held to the ear. At the foot of the bluff the marsh spread, its mass of high tules breaking into graceful billows beneath the press of the ocean breeze, and lighted here and there with a touch of gold, where the dying sunlight lay upon a field of ripened cuckle-burr and dead marsh grass. Close by the bluff a lake, irregular in outline, its shores lost among promontories and islands of tall waving tules, its surface rippled and dimpled by the breeze, lay like some rare pearl dropped on a bed of moss. Dotted here and there on its surface flocks of ducks sported and called in liquid notes to their mates wheeling in from the sea. It was a picture to delight the lover of nature, and make a wildfowler's blood tingle.

The same thought was present in the minds of Kenneth and the Duffer, and the latter voiced it by saying: "Shall we stay another night, Kenneth, and have a try at the teal hole in the morning?" Kenneth's answer was affirmative and prompt. We sent our birds home by the boys, and after waving them adieu as they drove off over the mesa on their way back to town and pavements, we turned back to the bluff to watch the evening flight of the birds.

Bands were coming in from the ocean, where our early morning bombardment had driven them, for their evening nip on the lake, and their nightly feed on the stubble fields. The ascent from the marsh to the top of the bluff was steep, and as the bluff was perhaps 150 feet above the marsh, the birds came in about on a level with us, before dropping to the water.

The west was a curtain of flaming red, with the incoming flocks silhouetted against the fast fading light, when we turned to go back to the cabin, where, after a dinner of broiled teal and freshly gathered mushrooms, and a pipe or two, we gladly tumbled into the bunks, tired after the day's shooting. But not to sleep until Billy, the keeper, had detailed another chapter of his experiences as a man-o'-warsman. Billy was an Alsatian, and had put in at nearly every port of the Seven Seas at one time or another, and his accounts thereof furnished a sort of modern Arabian Nights entertainment. The Duffer left Billy wandering about some port of Brazil and having troubles with the water-front police, when sleep put an end to the tale.

Breakfast over next morning, Kenneth and the Duffer, with ample rounds of nitros tucked away in shell vests and pockets, slipped and slid down the steep

path of the bluff and on to the marsh. Somewhere ahead of us, snugly hidden among the dense tules, whose tassels waved many feet above our heads, was a patch of open water—dubbed by the boys "teal hole," though why teal and not mallard, or sprig, or gadwall, history sayeth not. No one had ever been there, so far as we knew, but we knew that open water there was, from the actions of the birds in trading over the marsh. The sun was up, and the ducks were holding high carnival on the lake and its bays as we trudged along its margins. However, we were bound for "teal hole," and so let nothing tempt us from our course, not even when a band of mallard swung down and into a little cove near us.

Once in the high tules we found it impossible to proceed except by following one of the cattle trails that threaded the marsh here and there. These led, as we soon found out, in no particular direction, and we were getting hot, weary and discouraged, when only a short distance ahead of us, we heard the roar of many ducks taking wing. Guided by the sound, we broke our way through the almost impassable tules until suddenly and with a great sense of relief, we parted them and stepped out into a beautiful pond of open water—the "teal hole." It was perhaps a hundred yards long by half as wide, fringed by a compact mass of tules at least twelve feet above the water line, among which, in places, the older stalks had fallen so as to form a platform on which one could lie at ease, or even walk, with care. The water came to the bottom of our shooting coats, but as the footing was hard and we wore waders, that made little difference. Selecting two stations on the shady side, and at either end of the pond, Kenneth and the Duffer climbed out on the tules, and removing our coats to make a nest for our shells, proceeded to make ourselves comfortable and await events. We had no decoys, of course, and in fact needed none. It was not long before the raft of birds which had taken flight at our noisy approach through the tules began to return in singles, pairs, threes and small bunches. The shooting was not as easy as one might suppose, for the height of the surrounding tules prevented the birds being seen till fairly over us, and then quick work was necessary to kill clean and drop one's birds in the open water, for a bird falling in the cover was lost for good—or bad. Then, too, there was no general direction to the flight, as the birds pitched in from all quarters.

We had hardly gotten settled before the rapid whiff! whiff! of wings announced a pair of mallard. They poised for a brief instant over the opening, and Kenneth's and the Duffer's guns spoke as one. Each bird must have received a double charge, for they collapsed and fell as though flattened out. Kenneth chuckled. The Duffer called out as he blew through the barrels. "You wasted your powder, old man." Next a band of teal—greenwings—darted down so quickly that the rapid four shots must have been badly directed, as only one little fellow was beating the air with his paddles when the echoes subsided. Then swiftly overhead glided a band of seven—gadwalls—but so silently, so swiftly, that the guns did not speak. Then with straining eyes we watched and waited—when, swish! they had circled, and were over us again, and beating the air to drop. This time the work was perfect and two brace of the beauties were down—clean killed.

The morning gradually wore away, and beside the two gunners in the tules two piles of ducks had collected, while some odd birds were chafing the rushes in the sunlight on the lea side of the pond.

Just as we were gathering up to go, a mixed band of cans and redheads came in like a limited making up time. Two barrels spoke to empty air, but as the two seconds cracked out their call, a grand old drake can fell with a royal splash. "Good shot, Bob," sang out the good-natured Kenneth, and "Your bird," called the Duffer, not to be outdone. It was grand sport, but oh, what work it was getting the birds in! The straps swung over the guns, and the guns balanced, muzzle and heel, on two pairs of aching shoulders, the interminable tules, the ooze, and muck that held our tired legs as in a vise, but at last the trail opened on the lake side, and there on the bluff was the cabin, and rest, and dinner, and pipes, and good cold beer, and smiling Billy calling out: "Well, poys, gudt luck, yes?"

ROBERT ERSKINE ROSS.

In Buncombe County.

ASHEVILLE, N. C., July 28.—*Editor Forest and Stream:* The last session of the Legislature of the State of North Carolina enacted a law incorporating the Audubon Society of North Carolina. This law specifically states that "the Governor shall appoint such game wardens as shall be recommended by the Audubon Society."

The aim of the Audubon Society of the State of North Carolina is to enforce the State and county game laws, and also to protect the song birds, their eggs and nests. On and after September 1, 1903, non-resident hunters in North Carolina will have to take out through the clerk of the Superior Court of any county a non-resident hunting license, the fee for which will be ten dollars. This license will allow the hunter to hunt in any county in the State, provided his hunting is done in conformity with the local county law. Unfortunately, most of the counties in North Carolina have different game laws, although the non-resident license will apply to all counties alike. Some of the county laws are very drastic, absolutely prohibiting trespassing or hunting on the property of another without first having obtained the written permission of the owner. In Cherokee County the law prohibits the carrying out of the county (dead or alive) any quail, pheasant or wild turkey, either by a resident of the county, State, non-resident, or by any common carrier.

The open season in the different counties is not exactly the same, but generally all game is protected from Jan. 1 to Nov. 1. In Buncombe County the close season is from January 1 to Nov. 15.

Under the present laws it is expected that the wholesale shipment of birds and game out of the State will now be prohibited, as it is the purpose of the Audubon

Society to appoint game wardens all over the State. They have already this summer done good work along the coast in protecting the sea birds from the plumage hunters.

Some two months ago there was organized in Asheville, N. C., a branch of the Audubon Society of North Carolina for the purpose of protecting the game and song birds in Buncombe County. We will this fall have several game wardens in the field and purpose to see that non-residents, as well as the citizens of the county, conform to the present laws.

For several years back there have been thousands of bull bats shot in the vicinity of Asheville every August; these birds flying just at sundown, making fine sport for those who enjoyed this kind of shooting. It is our intention this year to make every endeavor to stop this practice. The local branch of the Audubon Society are now placing posters all over the county calling attention to the present game laws and offering a reward to any person who will furnish evidence sufficient to convict any violator of the game laws. I herewith inclose you a copy of our poster, together with a copy of the Audubon bill above mentioned.

Every fall, North Carolina is visited by a large number of non-resident sportsmen and to those who have their localities already chosen, I would suggest that they secure their licenses before leaving home, by writing to the clerk of the Superior Court in the county which they propose to visit; this can be done by addressing the clerk at any time after Sept. 1. A license taken out in one county allows the holder to hunt in any county he may desire, but does not in any way give the hunter the privilege of trespassing except as provided in the different county laws.

The formation of this society has already resulted to the advantage of our song birds here in Asheville, as there has been much less promiscuous shooting going on this summer than ever before. We now have a good law and we propose to see that it is enforced.

C. P. AMBLER.

More Game Preserve Chuck.

Editor Forest and Stream:

Probably I did not make my meaning clear in what I said about game preserves. I do not advocate destruction of millionaires' rights any more than I do those of less wealthy individuals. But I do say that the uncultivated and uncultivable lands seem from the very fact of their uselessness as regards financial profit to point to a use by the general public rather than by a few individuals. And it is in the right of eminent domain that individual selfishness finds its check. The right of eminent domain has been expressed several times in a fashion that left its mark on history. In France this same question of game preserves flamed into a revolution. I refer any one to Carlyle's "French Revolution" for details and deductions therefrom. The law was on the side of the preserve owners. Everything that lawyers and judges could do was done to protect the owners of these preserves. But the owners of monstrous preserves were killed when their peasants revolted. The indisputable right of the many is paramount, and that right is not made by any set of lawmakers in human guise. I know how some of those lawmakers get their offices. I have heard the prices of votes discussed. The laws on the statute books are not all just and good—if so, why the many changes from year to year? What has become of the "divine right" of kings, for instance?

I do not say that millionaires ought to give their property away to the poor. I don't believe in any such thing as that, though some of the wealthier men are casing themselves in that direction to some considerable extent. But I do maintain that the State, and not the individual, ought to own the Adirondack wilds. It is the playground of scores of thousands, and these thousands are of more importance to the State than any score of millionaires. It is more important that 50,000 men be in good condition to do their work than that any fifty millionaires should have each a lolling place of 50,000 acres per. It is entirely feasible that the State should acquire by the legal processes the right of eminent domain to the Adirondack region. I do not believe that there is anything fanatic in the proposition that the Adirondacks be a great park where all men, millionaires and clerks, and farmer and woodsmen, and mechanic—men, women and children of every description—could roam at their own free will, so long as they did not interfere with the rights of others.

In regard to the game belonging to the men who own the property, suppose the preserve owners took a notion to kill off their game for the sake of selling it—getting some of the divine rights profits out of their "property?" Where would we be at in a case like that? More especially if the game was migratory?

The bearing of the Golden Rule on the question of private game preserves is, of course, perfectly obvious, but it is unnecessary to go to that in the question of a State preserve. In the latter instance the selfish argument of "policy" is sufficiently strong. Some men are so dense as to be open to only the one argument of "it pays," and to these people it can but be perfectly plain that a State park would do the State—i. e., all the people—more good than any number of private parks from which all but the favored few are excluded. Places where the workers may rest during their vacations are a national necessity, and if the State does not provide them the State will tire out, for the State is the people.

There is no region in the world so well adapted for so great a number of people for a public playground as the Adirondacks, and it is the folly of New York that it does not make of it a place where all may come and go, camp, fish and hunt as they please with due regard for the comfort and rights of others.

It is right and proper that there are men of great wealth. They are able to use it in great and progressive enterprises which would otherwise be impossible. The man of wealth is of importance to the development of humanity as is the man of brains, but neither the man of wealth or the man of brains has the right to use his powers to the oppression of the great mass of people who haven't much of either. The wilds of the Adirondacks are of more importance than those of the Yellowstone National Park so far as humanity is concerned, and it

ought to be as free to all as the National Park—gun restrictions and all if the need of the whole host of visitors to it required it.

I quite agree with Didymus that it is simply fighting the wind to argue with regard to the selfishness in the question of private game preserves. It is not thus that the question will be solved. Nor would it be right to deny to one man of wealth what is allowed to another in the way of preserves. But here in the Adirondacks the State ought to take the matter up, regardless of lumber company, game club, or individual, and take the land by the perfectly legal process of "eminent domain"—for the good of the many—in order to secure to the people for all time a beautiful land of play, recreation and health. The rectifying must be done with due regard to the law, and in no other way.

Personally I do not interfere with the legal rights of others, and I try to recognize their moral rights so far as I can affect them. I know of a few places where I can hunt unmolested by anyone, and I go to them. I could not feel comfortable hunting where I was not wanted, even though I knew the watchers would not catch me, and that I had a perfectly legal right to hunt there. I much prefer to hunt and fish where all are at liberty to do so, and my success is sufficient to gratify my desires. The trips of pleasant memory are not those that result in heaviest bags or baskets. A mere wood lot with only a chipmunk or two in it should be enough to fill anyone's need of pleasure. Nevertheless, the deep wild forests ought not to be closed to the man who longs to be beyond the sound of ax, wagon or train. For every man who loves woods let there be woods provided, free and unrestricted. It will do the nation good to have it so. No man ought to be prevented from yielding to temptation when yielding does no harm. RAYMOND S. SPEARS.

NORTHWOOD, N. Y.

Editor Forest and Stream:

In all humility I approach headquarters to ask its opinion of the existing condition of things in England. I suppose it is generally known that nearly all the tillable land is owned by a score or two of the lordly old families to whom it has descended from feudal times, when it was said that

"They may get who have the power,
And they may keep who can."

Enormous tracts were kept by those who could, and their power was such that advancing civilization could not interfere with them nor disturb their titles, and cannot to this day. Yet who among those who advocate the principle of the greatest good to the greatest number would not like to see that land distributed in a way that would benefit all England? Scarcely any grain is raised in the country, for the reason that very little land is obtainable by the working classes to raise it on, and England must import her breadstuffs and lose a great proportion of her population that ought to be kept to enrich the nation.

Whether the enormous increase of wealth is gradually leading our own free country into the same condition of things, I leave for wiser heads to settle, but all the arguments of the wisest men can never convince me that any consideration of the public good is ever thought of by the holders of these enormous tracts. H.

Sport and Sportsmen.

MONADNOCK, N. H., July 31.—*Editor Forest and Stream:* In your issue of July 4, Mr. Charles L. Paige resents Messrs. Hearst's and Davenport's attack on sportsmen. Never was a topic that called for more patience on both sides. Not to be sacrilegious, one might say, *Venator nascitur, non fit*—so truly justified does he feel in his attitude. So more than all other customs time-honored is this of killing to live, and so glorious to youth is the sense of daring all and enduring all to conquer a dangerous adversary; and who among us shall cast the first stone in a matter where all of us—every one in the world—are in the same boat? Only at most, a little further along the scale, one way or the other; all alike sharing a subsistence scheme in which we live by countless deaths of weaker animals.

In fact, the only standpoint for opposing sportsmen's killing is not the usual feminine cry against cruelty, that being untenable, considering how we all live. The true standpoint is the naturalist's claim that the world shall not be robbed of any of its beautiful life-forms.

In medio tutissimus—pursue the middle course—is the wisest of sayings, and the medium here would seem to be a state of willingness to kill for one's apparent needs, either bodily or mental; this willingness being midway between youth's fiery hunter period, and the sentimentalist's wish to die rather than to kill anything.

Will anyone deny that the most significant movement up to now is from these rapacity pleasures toward the pleasures of thought? Mr. Paige says: "In many cases it is the men who kill animals directly who are most active in preserving and increasing the animals for a useful purpose. The men who shoot game are at the present time the men who are most earnest in the efforts to protect and provide for it." Does Mr. Paige mean this for a joke? Surely no one ever hears sportsmen mention any but the one reason for such game protection, namely, that they may kill it. Mr. Paige forgets a mighty force, wielding already in its adolescence a strong hand, where he still sees only his own, when he says: "Who ever hears of anyone except sportsmen doing anything to protect game animals, or birds, or fish?" He should know that the Biological Survey is at work in Congress, and all over the land, for the protection of all species; and that as a choice of evils it often joins ranks with sportsmen, preferring to keep up a species even for them to decimate rather than see it vanish altogether.

Look at these two forces, side by side, in the effort to preserve game. The naturalists striving to save it to study and admire, and so that they may know that each wild region still has its wonderful typical inhabitants; the sportsmen, on the other hand, that they may kill it! Would any disinterested judge hesitate as to which of these attitudes is most representative of humanity's hope to-day?

As we look back into the prehistoric dimness,

rapacity and the joy of a brute's power to seize are almost all we can see. I say, give me the man who was in youth a brave, keen hunter, but in whom the student nature steadily grew, so that by middle life he can no longer find his joy in smashing these beautiful forms, no matter under what romantic difficulties, but has come to wish them all to live their lives out, that he and all may study, or at least know they are there in their own wild places.

An old sportsman in the midst of the Darwins and Bairds is too much like a man who has never outgrown his toys.

As to letting animals live their lives out, we know, of course, that this means, in many cases, their not letting each other do so; and, in fact, if the amount of hunting of each species could be scientifically controlled, it would not lessen the supply of game. But the trouble is the "runs on the banks" of game; the increased pursuit of some species at the very moment for holding off.

ABBOTT H. THAYER.

Deer in Connecticut.

NEW YORK, July 21.—*Editor Forest and Stream:* On Thursday afternoon, July 2, just passed, while driving about 6 P. M., on the road leading out of Salisbury, Litchfield County, Conn., at a point where it skirts the nearly precipitous flank of Baracmatiff Hill or Mountain, my friend, Mrs. J. William Greenwood, of Sheffield, Mass., saw, slowly making its way down the hill, a small doe, apparently a yearling. The animal paused at the edge of the brush and allowed the carriage to approach within thirty feet, when it bounded a hundred yards up the slope, pausing again a moment before disappearing in the woods. Mrs. Greenwood reported the matter to a Mr. John Fox, whose farm adjoins the hill, and within a half hour from the time the doe was first seen, Mr. Fox jumped her again from the bushes not far away.

Mr. Fox, whom I subsequently interviewed, said that he has seen deer on several occasions within the past three years, the last time being about a year and a half ago in the fall, when he saw a spike buck in the road in the early morning.

Some three years ago, as I am informed by a resident of Salisbury, a number of deer, among them a large buck, escaped from a carload of animals consigned to the Hon. William C. Whitney, and on their way to his preserve, on October Mountain, near Lenox, Mass., and betook themselves to the mountains, shutting in the town of Salisbury on the west. There seems little doubt that the deer just seen is a native of the locality, and perhaps only one of a numerous progeny of the number escaped from the train.

The Dome (Mt. Everett), Race and Bear Mountains, and their adjoining spurs, forming the Taconic range of the Berkshires and dividing the States of New York and Massachusetts and the upper corner of Connecticut, being heavily wooded, wild, and sparsely settled on their eastern slopes, are, with their many water courses and ponds, a natural preserve and capable, could the animals be protected by proper legislation from dogs and the pot hunter, of sheltering a large number of deer, as the food supply is sufficient for all time. The ruggedness of the land offers little inducement to the farmer and the summer visitor, except for an occasional mountain climber, finds nothing to interest him there, while the partridges and woodcock are not plenty enough to tempt a stranger sportsman.

The local gunners, in a community where everyone is known, could scarcely escape detection if guilty of killing any of the deer, and the condemnation of the townsfolk, their interest once aroused in behalf of the propagation of the deer, would be a better safeguard against a local infraction of the law than a statutory penalty.

JOHN N. DRAKE.

[Deer have been often seen in Connecticut of late years; in Middlesex County, in Fairfield County, in New Haven County, and now in Litchfield County. They should be protected by public sentiment, as they are by law.]

Massachusetts Deer.

JOHN CUMMINGS, a farmer living on Dean Hill, Richmond, Mass., has complained to the selectmen of annoyance to him of a herd of deer—some six or eight in number—which are herding in the woods south of his farm. He has asked Chairman Sherritt for an appraisal of damages to his crops, and a reimbursement for his loss. At intervals for several months deer singly and in pairs have been seen in other parts of Richmond, but this is the first complaint ever entered against their depredations, so far as the records show.—Springfield Republican.

Two well grown deer, one of which had well developed horns, were seen Friday near the Curtis place on the road from Laurel Park to West Hatfield Chapel. They are supposed to be two that have been making their home in the woods beyond West Hatfield. Deer are becoming plenty again and specimens of the family are seen every day or so.—Hampshire Gazette, Northampton, Mass., July 25.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

93

GLOUCESTER, July 26.—*Editor Forest and Stream:* I had my attention called a few days ago to a gruesome find of a Gloucester fisherman on Georges. He had pulled up a forty-pound codfish and when it was dressed found in its stomach a pebble with a strip of human hair grafted on the surface. The pebble was about one and one-half inches in length. The hair was nearly three-eighths of an inch long and was fine in texture and of a light brown color. The strip of hair was about one-half inch wide and one and a quarter inches in length. The graft was as complete as if the surface of the pebble had been a part of the man's skull.

HERMIT,

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Recreating in Florida.

I LEFT Macon on the night of May 11, last, bound for Alcyone, the home of Capt. J. F. Stapler, at Alcyone. An all night's run brought me to Valdosta, that thrifty little southern city of such rapid growth and remarkable development. Changing cars at Valdosta, in about forty minutes we reached Lake Park, Georgia, only a few miles from the Florida line, and in a few minutes I was in a double hack bound for Alcyone, six miles distant.

We passed around and in sight of Ocean Pond, quite a large lake, recently bought by a stock company who propose to fence it in, and prohibit shooting and fishing, except to club members. I learn that a great many fish are caught out of this lake, and often some very large ones. My brother (Judge R. J.), caught a black bass there some years ago that tipped the scale at ten pounds. I reached Alcyone in good time. Capt. Stapler has a most lovely home in a beautiful grove of large water oaks, festooned with moss, with an occasional magnolia scattered among the oaks, all combining to afford an abundance of shade. In front of the house there are two rows of oaks sixty feet apart, the limbs of which meet, and this gives a stretch of one hundred and twenty feet of shade. Back of the house 200 yards is Lake Alcyone, the largest of five or six lakes, covering about seventy-five acres. The others are much smaller, and one of these is connected with Alcyone. It is almost circular, surrounded almost entirely by woods, and is a very beautiful sheet of water. Bream and large-mouth black bass abound in these lakes.

May is an off month for fishing here in these lakes, except for bream. You can catch a good many bass, but mostly small ones. The Withlacoochee River flows through the pine lands about one mile from Capt. Stapler's home. It is a beautiful stream, and I had high hopes of some excellent fishing there, but the continuous and very heavy rains of the first week of my visit put an end to my hopes in that direction. We did not wet a line in that beautiful stream, and hence my fishing was in the lakes entirely.

It was my very great pleasure to meet a party of twelve ladies and gentlemen, mostly from Marshville, the famous peach section of Georgia. Several of the Rumphs, with their wives, among them Mr. Sam Rumph, who has made the Elberta peach famous, were with the party; and Mr. Ben Moore, a veteran fisherman, as fond of fishing as the youngest of the party; it would do you good to hear him yell when he hooked a big one.

Mr. Jesse Hunt, of Jones County, an old friend, was the life of the party. He kept the party full of fun and jest, and was up to most of the tricks of the young folks, though the young widow taught him how to "pin a saucer to the wall," resulting in part of a cup of water running down his back, greatly to the amusement of the entire party.

As we had quantities of rain for about a week after arrival, and not wishing to exert myself too much, or be in the hot sun a great deal, I did not catch any large strings of fish. About twelve or fifteen a day satisfied me. We had quantities of them every day. During the last three or four days of my stay I caught forty fish a day, just as many as I cared for. I caught no very large ones, one 2¼-pound bass being the largest one that I landed, and the largest caught by the party. The large ones are caught very early in the spring and in the fall. The river fish are much more game and finer food fishes. The most successful lure is phantom minnows, and one can catch bream, red perch and black bass if skillful in handling a 20-foot pole. The rod and reel don't work as well here.

Dr. J. B. S. Holmes, of Atlanta, has a plantation about half way between Lake Park and Alcyone. The Doctor is very fond of fishing and hunting, and comes down frequently to fish in spring, or to hunt foxes or wildcats in the winter. He keeps a very large kennel of foxhounds. I would like to have a cut for you illustrating the Doctor's fishing, but you may imagine how he looked. Not being able to procure a boat on one occasion, he ordered his man to saddle old Liz, a little black mule belonging to Capt. Stapler, famous as a saddle animal and deer hunter. Riding out into the water as far as he could without wetting his feet, he sat on Old Liz, and, having a long rod, threw the hook to land and had a live minnow put on the hook. He would cast out from him, get a strike, play his bass and work it to the land, where his man would take it from the hook and rebait for him. Thus fishing he landed fourteen bass. How is that for novel fishing? Mrs. Holmes is more enthusiastic as a fisherwoman than the Doctor is as a fisherman, and frequently catches large strings. She reserves one lake for her own fishing, and allows only a few friends to fish there. Capt. Stapler's friends and visitors are among the number. I went over with Capt. Stapler and Mr. Nash Murph, of Marshville, to fish in this pet pond, and while arranging my rods, preparatory to taking a boat, the other gentleman having gone around the lake to get another boat, Mrs. H. came along, stopped, and asked what I was going to do. I replied: "Going to fish." When she said: "We do not allow fishing in this lake," I politely informed her who I was, giving my name, and telling her I was a guest of Capt. Stapler. She very smilingly apologized, and told me to go ahead, and remarked that she had heard of me. We afterward had quite a pleasant conversation at Capt. Stapler's, and I was glad to meet her and to learn that she was a classmate of my wife, and graduated with her at old Wesleyan Female College—the mother of female colleges—located in Macon.

Quite a shower of rain came while fishing, and I had to seek shelter, and with my friends we left for home with about twelve bass between us. Mrs. Holmes con-

tinued to fish till after sundown, and landed twenty-one bass, as she told us next day. I felt like getting her to take me along and show me how to fish.

Capt. Stapler has leased the fishing and hunting privilege of his place November, December and January of each year to several wealthy gentlemen of New York. They come down at that time and find great quail shooting, and can very easily kill the limit allowed by law. They sometimes go by wagon about sixty miles below Alcyone, and spend a week deer hunting, killing from five to ten each trip. Quail shooting is very fine in that country, but the excellent law that Florida has is very frequently violated. Like the game laws of Georgia, most of the better class of sportsmen keeping them; they do not amount to much, and will not till our sportsmen have a large number of wardens appointed and prosecute all offenders to the extent of the law. I have pleaded for years with our local sportsmen to reduce their bags, but fail to make converts to my theories. The prospect is that good game laws are coming to us.

After nine days delightfully spent, I returned to Macon with the hope that I could accept the invitation of the Marshville party to "be with us on the full of the moon next May."

J.

Memories of Fishing at Devil's Lake, Michigan.

TWENTY-SIX years ago, in 1877, FOREST AND STREAM published an article by me, entitled: "Pencilings at Devil's Lake;" and this was its final paragraph:

"We feel that one who has suffered a two years' imprisonment in a busy city office, surrounded by stone walls, and breathing an atmosphere of smoke and dust, may be excused for his enthusiasm over the attractions of this sheet of water—bluff-guarded, rill and spring-fed, forest-girdled, wide-winding, with its many coves and grassy banks, its pure air, green pastures and still waters—beautiful Devil's Lake!"

Here is a picture of that lake from a photograph taken last month; and it seems identical with the memory-picture of more than a quarter of a century ago, as it lay, a vision of loveliness, under the light of a late afternoon when I turned away from it with such regret.

"There is no doll like the old doll." I have since fished for trout, salmon and ouananiche in lakes on Vancouver Island, and in British Columbia, Quebec and Newfoundland. But the fishing of that far-off springtime of life has made Devil's Lake hallowed in recollection; and memories remain vivid of those early years that held no dream of split bamboo rods, shining reels, and flies and leaders. And when, years later, I ventured to write about it, how I hesitated! And how gratifying to the young angler that genial welcome in his lower Broadway sanctum, of the editor of FOREST AND STREAM, Charles Hallock, recognized even then as the Nestor of American anglers and writers about fishing—a man of ripe experience with the Adirondack, Nepigon, and Maine trout and Restigouche salmon—who used flies made in Edinburgh, and cast them with Murphy rods. He was a very seer of angling to this boy who had as yet only wielded a cane pole and used a cork "bobber" with the line tied fast to the pole's tip; and who had caught only perch, sunfish, blue-gills, rock bass and pickerel, and a very few black bass. May the years pass lightly over Mr. Hallock's head; he is an oldish man now (sixty-eight); but still rays forth his terse articles for FOREST AND STREAM, although not its editor.

The writer's earliest memory is of a little pool on Bean Creek (outlet of Devil's Lake), forty years ago in Lenawee County, Michigan, where he saw and felt two-inch shiners bite the "nightwalkers" tied to a tow-string—which soon held a bent pin hook, and was tied to a four-foot pole cut with a dull jackknife.

There came a day when a boy comrade showed him a "sure-enough" fishhook, a No. 10 Limerick, with an actual barb. As a great favor, he was allowed to hold it between thumb and forefinger, and jerk violently at an imaginary shiner impaled thereon. No rest now until he owned a like hook. A silver dime was begged from a big brother, and off he trudged, bare-footed, to "Coontown," (now Addison), where he actually bought two hooks and a cotton fishline. Osborn, the grocery man, pinned the tiny packet into the boy's shirt, for he had no pockets. And the boy felt for that packet over every rod of the returning two miles to Hale's mill-pond, where he caught his first sunfish from the pool below the waste-weir. How many men in that region have seen and recall Hale's and McLouth's millponds? Their beds have long been green fields in summer.

During five happy years the writer fished and bathed in that creek. He wondered where its waters started—where they came from—and a comrade said to him that the creek was the outlet of Devil's Lake, a great ocean three miles long and a mile wide. Impossible! Yet an afternoon came when he saw it from his seat beside his father in the "lumber wagon," saw its blue vastness, the waves, tipped with whitecaps, and heard it roar. Even over the tops of those woods that intervened, it seemed more titanic and beautifully fearsome than the Atlantic Ocean does now. He dared not even hope to fish there. But the next week a great summer camp-meeting was held on its south shore; and he had the joy of crouching in the bow of one of the three old boats on the lake, and looking, frightened, at the awful clear depth and blueness of the water, and the terrible waves, at least six inches high! He slept in a tent made with sheets, and heard the lake roaring in the night. Those were the days of Evangelist Polly Cross and class-leader Charley Carmichael, forty-five years ago—days all but forgotten even to the residents of that region. How few of them will recall the old names: Darlington's Point, Chandler's Landing, Willett's Cove, Doc. Benders, Saunders' log house, Gassy John and Col. Elliott, and that the only available boat was owned by "old man Thrasher," a leaky punt used mainly for spearing by the flames of tamarack light-wood in an iron "jack." He often saw that crazy old craft careen, and its wet sides glisten in sunshine; and how he longed to be out in it, anchored over the fish-weeds at the point of the long bar that extends south-

east from the west end of the lake. When he got to be a man he might fish there. Yes, the slow years would bring relief from the stern injunction of his father: "Keep off and away from that lake or get thrashed with a blue beech gad!" The gad was already cut and laid in plain view for his benefit; but as the boy looked at it, he knew the time was near when its terrors would be braved for the sake of fishing on Devil's Lake.

For he was fifteen years old—a big man. Why should he not fish there? Weeks followed full of secret plans with a boy comrade of fainter heart. Independence Day became only a week off. Stealthy digging of earth-worms at the edge of the straw-stack behind the barn! Stolen trips to town, and furtive purchases of "big" hooks and lines, and cork floats. Piratical exploration of the tamarack swamp west of Tom Lewin's, where "poles" were cut, trimmed and peeled, and surreptitiously dried. Precious days, more precious because of the sure punishment to follow transgression. But we aided each other's courage by the frequent cry of "Goin' a-fishin', lickin' or no lickin'." And on July 4th, Liberty Day! How we saved and planned "riding horse to plow corn" at 15 cents a day to get the dollar we would have to pay for the boat on that holiday! We paid it late on the night of the 3d and secured the boat-key from the admonishing Mr. Pattison, the boat-keeper at the "landing," who is renting boats there yet after almost forty years, and who has furnished the means for enjoying more real angling

and from Marshall and Jackson, Mich., by various divisions of the Lake Shore and Michigan Southern Railway, and from Cincinnati by the Cincinnati Northern Road, and has comfortable cottages and hotels, notably the Lakeview, Devil's Lake and Pleasant Grove hostleries, where anglers, alone or with their families, can be comfortable at very moderate rates. Its railroad stations are Manitou Beach and Devil's Lake. It is a singularly wild and beautiful sheet of water; but no attempt will be made here to describe its beauties.

Many writers have given fanciful accounts of the alleged events that gave the lake its name of *Michi Manitou*, or Devil's Lake. But the "legend" and "tradition" are imaginative. Here is a sample of such stories, taken from an elaborately written book about the lake:

"Many hundred moons ago, long before the paleface came to destroy the forests and lay waste the land, a tribe of Mohawks had their home here." Of course the chief had an only daughter (he always does in such stories), and "her eyes were like the forest pool where the trout hide, and her hair was matched only by a moonless night in November. Her cheek was the brown hue of the partridge wing, save where the tint of the wild rose glowed in its dusky shadows; and her laugh was like the ripple of the waterfall when the south wind blows upon its surface."

A young Wyandotte from the shores of Lake Erie "whispered in her ear a story told in all climes and translated into all languages." And her cruel papa fought little Dan Cupid, and hustled the dusky maid

is located. The writer knows about a dozen of these ranges; but they could not be described in these columns so a reader would recognize them when searching for them on the lake.

Here are some of the better known places that are favorite fishing places with many local fishermen:

There is a "circle" in the bulrushes northeast from the tip of Darlington's Point about fifty rods. This is a basin about eight or ten rods across, free from rushes, and with many fishweeds eight or ten feet high, whose tops are near the surface of the water. Perch, sunfish, bluegills, rock bass and sometimes a black bass can be hooked and landed there.

For much better fishing, row from the "circle" northeast to where the bulrushes of the bar terminate in a point at the edge of blue water. Eight rods further to the northeast, over blue water, and the boat will be over a bar four or five rods across and under water about eighteen feet. There the angler should find excellent midsummer bass and perch fishing. Not over a half dozen residents of that region know of that little bar.

Two hundred rods northward is the south point of Willett's Cove. Row right east from that over what you suppose is blue water, and suddenly you will be going across the point of a curving bar, with the usual tall weeds whose "buttons" will show on the surface. Excellent fishing for sunfish and bluegills should be found there, and all along the east edge of the bar, to the point of rushes thirty rods north.

A similar narrow bar, with like weeds, lies northeast of the north point of the Cove. If the day is still and sunny, possibly the buttons of the weeds may be seen on the surface of the water, otherwise the angler will need the tree-range to locate the spot; and one of the trees cannot be described here so it would be recognized from five or six others close to the shore. The angler might place each of them in line with the tree on the top of the low hill eighty rods north from shore, and row across that bar at last. It furnishes the second-best fishing at the lake.

At the point of the bar southwest from Cedar Point, on the east side of the lake, is another excellent fishing place, marked with a like patch of fishweeds.

South of the shallow white bar running south from the south point of Saunders' Cove, on the east side of the north lake, is a bar that extends forty rods out from a line of rushes, and gradually growing deeper, with very tall occasional weeds with a pair or two of leaves on their tops, near the surface. At the point of that bar is excellent fishing for perch and black bass.

South by east from that bar point twenty rods, and the rower will pass over a circular bar about six or eight rods across, and it is edged with fishweeds. It is a capital place for bluegills and bass fishing, as is also the north side of the ten-acre bar that lies across eight rods of blue water to the south of the circular bar.

Finally I mention a fishing location whose existence cannot be known to but two or three men in all that region, and they could scarcely find it in a cloudy and windy day.

Ten rods directly west from the smaller, circular bar, surrounded by stretches of blue, deep water, is a bar twenty feet down, and about three rods across. It is nearly round. The fisherman who can find that bar will not only take very large bluegills and perch, but both large and small mouth black bass. It is the choicest fishing ground at Devil's Lake. It can hardly be located even with these directions, except when the lake is still. Then the angler who expects to revisit the spot should study the shores and mark the exact spot by far tree-ranges, as he can do from both the east and west shores. It will seem absurdly easy to find again when the day is sunny and the water is smooth, and the anchor is actually cast there. But it will be a far different matter when waves are running and skies are overcast.

L. F. BROWN.

Without Wetting the Hook.

Editor Forest and Stream:

Coming back from the Pacific Coast a few weeks ago I heard a pretty good fish story. It was in the smoking compartment of the Pullman sleeper that leaves St. Paul early in the evening over the Northwestern road. I hope I am not violating a confidence, but it was too good to keep, and I believe it to be absolutely true.

A man from Eau Claire, Wis., whom from his conversation I judged to be lumberman and one also who dabbled in mining properties, was the man who told the story, and he imparted it to a friend who was coming East to buy machinery for a new saw mill he was building near Everett, Wash. The scene of the story was laid a short distance north of Bonner's Ferry, on the Great Northern Railroad, and I was particularly interested because I had just passed through that country and had been disappointed in not being able to stop near there for some fishing myself. The Eau Claire man had some new fishing gear in his valise that he had just been trying and found very killing, and this started him on his story.

"Talk about good fishing," he said, "have I seen you since I made that trip up into Idaho to settle the bet I made with Bailey?"

"No," replied the other.

"I never had any fishing like that before, and I am going up again this season. You know Bailey of Duluth, the man who is a good deal interested in Western mining properties? Well, I run up to Duluth occasionally and I frequently see Bailey there. He is a royal good fellow and he can tell as big a story as any man I know of—in fact, he rather has the reputation of being particularly artistic when it comes to putting fine touches on a good story, fish or otherwise. I was talking there with Bailey one day about fishing and he began to tell a tale about the prodigious number and immense size of the trout he had caught in a little stream near his mine in Idaho, the last time he visited it. The whole thing sounded so ridiculous that I had to laugh. I was surprised to find that this time instead of expecting to be laughed at, Bailey got rather indignant.

DEVIL'S LAKE.

sport than any other dozen men in Lenawee County. And yet some of his patrons grumble when he charges them "a quarter" for a whole day's use of a boat, with oars and rods, lines and hooks!

We rose long before daylight, and walked four miles to the landing. That was July 4, 1865. At last! How glad the sky and sunlight, and water and freedom. The lake stretched away for miles, solemn, joyful, its little billows hardly an inch high. But it was rather fearsome to row from the shore as shown in the foreground of the picture, northeast over the bar that runs across the lake to the southeast from Darlington's Point, and on over more blue water, two miles to the edge of the light clay bar on the east side, at the south point of Saunders' Cove. There the water deepens from six feet to fifty, right over a shelf. And we anchored, and fished over that edge. We were only expecting to get sunfish, perch and bluegills. I can see yet, just how that bobber looked, and how excited I was as it bobbed, and swiftly went down two feet before I pulled! My boy comrade had a like bite at the same time, and the next instant a couple of three-pound black bass were leaping and scaring us, and were gone, leaving us to look at each other in fright and dismay!

Substituting larger hooks, we even yet lost the largest fish; but by nine o'clock that morning a dozen splendid bass lay in the boat. Glory enough! We were back home to a late dinner, and took that punishment, and knew that we were buying our fun cheap. We met in a fence corner that evening, midway between our homes, and talked and lived over again all the joys of that tremendous day.

Never again, in all the years of camping and trolling and use of modern tackle, did such luck come to me—the cup of joy was full and ran over in richest measure, that very first three hours of fishing for black bass on Devil's Lake.

This lake is remarkable for the number and size of its fish. It is in a very fine and thickly settled farming country, and is fished by from four to thirty boats daily from early spring until late fall; yet it is sure to yield a "mess" of fish for the crudest anglers with clumsy tackle. It is reached from Chicago and Toledo

back home to the lake. But a "plaintive note of a seeming whippoorwill used to convey a signal to her that was full of meaning." Stolen interviews in forest dingles, flight, pursuit, a canoe, a storm, an upset, a drowning; and the lovers were buried in one grave. All the account lacks is the couplet from Lord Lovel:

"And from her bosom there grew a red rose,
And from her lover's a briar."

All this is absurd. No young Indian would have been upset from a canoe in any storm there; if the couple had been spilled into the water, they would have swam ashore. The writer once swam across the whole lake from the house west of Darlington's Point to Green's woods.

The real story is as follows:

A sub-tribe of the Mohawks had a "village" at Cedar Point, on the east shore of the north part of the lake. About 1740 two squaws tried to cross the lake on thin ice, and were drowned. Three braves who tried to rescue them were also drowned. The five bodies were buried somewhere on the shore between Cedar Point and the innermost curve of what old-time anglers there know as Saunders' Cove. No trace of those graves has existed since about 1800.

The above story, as well as a fanciful "legend," was told to me in 1875 by Joseph Beal, a resident then eighty years old. He said it was related to his father by old trappers and hunters, and by some old Mohawk Indians, the story being thus carried back to 1740. There was no formal naming of the lake by the Indians; but they at once designated it as the Lake of the Evil Spirit, and there is a present feeling of restiveness that so very beautiful a lake should bear such a name. There is a farmers' picnic on its shores once a year, after the harvest, and from forty to fifty thousand people gather. This annual picnic was first held about thirty years ago, and each one brings together a larger crowd than its predecessor.

Almost anywhere along the lines of blue water there is fair fishing. Many of the very best fishing spots can only be located by "ranges"—getting certain trees or objects on shore in line with other objects farther inland, and rowing, keeping the objects in line until the special bar, patch of fishweeds or sunken stake

"'You don't believe what I am telling you, eh?' he finally said rather sharply. 'Well, I'll just tell you what I'll do with you. I'll bet you an even thousand dollars that I can take you up to that stream and show you a place where you can catch all the trout you can carry without wetting your hook.'"

"Of course I laughed at him all the harder, and the harder I laughed the madder he got, until finally he actually bet me a thousand dollars to a hundred that I could go up there and catch my fish basket full without wetting my hook."

"'Say, Bailey,' said I, 'do your trout up there have wings or do they go out in airships when they want their breakfast?'"

"'Never you mind,' he replied, 'we'll just step over to the bank there and put up the money.'"

"Put it up we did, and I never felt I was going to get \$1,000 quite so pleasantly and easily as that. To make a long story short, soon afterwards we made the trip out west together. We went to Bonner's Ferry, and took the Kootenai branch about fifty miles north of there to Port Hill, where Boundary Creek comes in. We went up the creek a little way and came to a place where the stream, which was perhaps about as wide as this car, was a tumbling sheet of foam for two or three miles as it tore its way down the canyon. I fixed up my rod and, according to Bailey's instructions, put a piece of red flannel on the hook, and lowered it down toward the water. When the flannel got about three inches above the foam an immense trout broke the water and grabbed it. It gave me a terrible start. Everything was so wild around there and the fish were so big and savage I felt almost like taking to the woods. And do you know that's the way those fish did just as long as I cared to take them. Just hold the bait over the water and they jumped for it, yes sir! Of course, my hook got wet, but I didn't need to put it in the water to get fast to the fish. I was perfectly satisfied, and when we got home I told the bank to pay over my hundred dollars. It was the cheapest fishing I ever had in my life." E. P. H.

APPLETON, Wis.

In the New York Aquarium.

(Continued from last week)

AN attractive tank is that of the sunfish where upwards of fifty of them dwell together in peace and harmony. This fish grows to a length of eight inches and weighs half a pound. It builds for itself a nest in the mud, sand or gravel. The eggs are attached to stones or water plants, and it is said (singular fact) that the male performs the duties of nurse and nest builder. The sunfish hang poised in the midst of their watery prison apparently looking out curiously at visitors and affording the best view of their beauties. Their home is furnished with a square arch of stones.

The American sole, commonly called "sticking plaster," appears to be scarcely thicker than that retailed at a drug store, and, with all its adhesiveness, it clings or fastens itself to the rocks. In the aquarium they adhere to the walls of the tank, and at first glance are often unnoticed. One of the prize winners for homeliness is the big Mississippi catfish. Conscious of his deficiencies, he keeps himself as much as possible out of sight against the back wall of his apartment. Another common looking chap is the mudfish, otherwise called bowfin, dogfish, lawyer or John-a-Grindle. He, too, comes from the sluggish Mississippi and its great lakes, and has no particular merit of any kind. On the one hand he is worthless as food, while on the other he has a large appetite of his own, which he appeases with frogs and small fish.

The big tank where the crustaceans are kept is like an alcoholic nightmare. It is full of horseshoe crabs, lobsters, misshapen fiddler crabs, soft shell crabs, sea spiders, crabs with one claw, crabs with two claws, and crabs that seem to be all claws. There is one unsociable specimen shunned by his fellow monstrosities who is a perfect mass of nippers and horny legs and creepers, and all that you can see as a center for all this unpleasantness is a pair of malevolent eyes. Next to this unpleasant exhibit is a tank containing the most inert specimens of the collection. They are the chitons and sea urchins. The chitons look like teapot covers of fluted tin. They live at the bottom of the tank and attend strictly to their own affairs. The sea urchins are floaters. They are small, round, brownish, spiny affairs, and when you touch them they roll over and wave their spines indefinitely about. You can make a very good sea urchin of your own by taking a small round pincushion, sticking it full of headless black pins, and putting it in the bath tub.

Among things secured by the aquarium's own collectors, there are now here a number of small decorating crabs, the familiar and yet marvelous creatures that decorate the top of their shell with threads of marine plants, which they place there seemingly for purposes of adornment, but really to make themselves invisible, and so to protect them from their enemies. When it has attained maturity and large size the crab ceases to decorate itself. With its long, slender, curving legs it looks then like an enormous spider, and it relies then upon its size and activity to keep others at a distance; it would seem as though it might, for that, safely rely upon its appearance. But in its youth the decorating crab does wonderful things. It plants upon its back to be held there in a sticky glue which it secretes, bits and shreds of marine plants, commonly placing them near the front of the shell, above which they rise like the feathers or other adornments on the front of a woman's hat. It begins to do this at a very early age. Little decorators a quarter of an inch in diameter have been taken with bits of plants sticking to them; the little creatures had already begun to adorn themselves. Red plants the decorating crabs appear to use the most, but they take those of bright green, too, and of other colors. Decorators have been captured that had upon their shells scraps and shreds of as many as five kinds of marine vegetation.

When it is very young and small the decorator casts off its own shell to make way for the new one it sheds at frequent intervals; the very little decorators

shed twice in a month, the sheddings being less and less frequent as the crab grows older and bigger. When the decorator has come to be quite a crab and so as to carry upon its shell the bits of plants that it may place there for a longer time, these plants may grow more or less. When it does shed its shell, at whatever stage of its own growth, it sheds of course with it whatever fragments of plants may be left upon it. These sheddings, with the plant scraps upon them, may drift about and be lost or destroyed. If one should lodge in some place where it would remain undisturbed by the tides, the bits of plants upon it might then sprout up and grow into a considerable bunch of vegetation.

Of all the freak fish none appears more ridiculous than the boxfish. It looks as much like a gherkin as anything else. Covered with little spines and rather oblong in shape, it is doubtful if the ordinary farmer's boy off for a Sunday's fishing would know whether it was vegetable, animal or mineral. The cowfish is rather a homely chap, with a serious cast of countenance. The cowfish is so-called by reason of its resemblance to the head of a cow and has little horns that protrude just above the eyes. Its body is almost wholly encased in a bone shell, which makes it clumsy of movement. It feeds on mollusks and other small organisms found on sea vegetation, such as snails, cockles and shrimp.

Among the more remarkable fishes at the aquarium the strangely shaped file fish holds a prominent place, and the tanks in which they pass their contemplative lives are the objects of much attention. This is not so much on account of their liveliness as because of their most peculiar shape. So grotesque are they that one is tempted to believe that they are rather the victims of some marine accident than fish produced by nature purposely. If there were railroad trains on the bottom of the seas one might reasonably enough imagine that the file fish were its survivors, crippled and deformed, of a particularly bad rear end collision. They have dents and angles where the ordinary fish has glossy and shapely sides. Their fins are stumps and wiggle with touching industry in an apparently painful effort to keep the queer bodies upright, and the beholder watches with tension to see them turn turtle, for it seems impossible that the little fish should continue long to float in any way except what would seem the more natural way, namely, on their backs. File fish are cosmopolitans. They appear in almost all seas. In the aquarium are specimens from the Bermudas, from Florida and from Gravesend Bay, which is just behind our own Coney Island.

Three specimens of what is considered the rarest salamander in existence were received not long ago at the aquarium. They are known as the *Typhlomolge rathbuni*—the last name being a Latinization of the name of Richard Rathbun, the assistant secretary of the Smithsonian Institution at Washington—are found in only one part of the world, and are the only live ones that have ever been offered for exhibition.

The salamanders were discovered in an artesian well owned by the United States Fish Commission at San Marcos, Texas. The well is 188 feet deep and the discovery that it is inhabited by the Rathbun family has caused the officials of the Fish Commission to conclude that the bottom of the well is in some manner, as yet unexplained, connected with a subterranean cavern.

They are of a pinkish white color, somewhat similar to the axolotl family, and like the fish that inhabit the mammoth caves of Kentucky, are eyeless. Unlike other species of the salamander family, they have gills. They have a broad, shovel-shaped head, and their body is shaped something like that of a fish. They have also four skeleton-like legs that are believed to be utilized as feelers, since they propel themselves entirely with a short stubbed shaped thing that looks something like a tail, although it is not, strictly speaking, such an appendage, according to Mr. Spencer, who has charge of the laboratory.

A gluttonous starfish, a clam with an eleven inch neck and oyster shells nearly a foot long, were among the curious recent arrivals at the aquarium. All hail from local waters. The starfish is of the ordinary variety, but it possesses an extraordinary appetite for small snails. This appetite soon gained him distinction. Soon after his arrival he was observed by Mr. Spencer to be humped up in an apparent knot. His appearance was so odd that an examination was made, and no less than six small snails were found under him. One was clasped tightly to the mouth by the small tentacles and was in the act of being devoured. The others were held by the tentacles along the forearms for future meals. There were enough to last two weeks. The starfish secures his food by clasping the open part of a snail shell to his mouth in the center of the under side of the body and slowly sucking out the live snail.

The clam, which was described by a keeper as the original "rubber neck," is four inches long, and of the soft variety. Shortly after it was placed in one of the balanced aquaria—the laboratory—his abilities as a neck stretcher became apparent. The other day he broke the record by extending his neck eleven inches from his shell by actual measurement.

The large oyster shells were secured by Mr. John De Nyce, of the aquarium staff, in an old mill pond near Gravesend Bay. They are the largest, as far as known, ever found there, the largest of them measuring ten and a half inches in length and being in its heaviest part something like an inch in thickness. In old times oysters were planted and cultivated in this tidal pond. Their cultivation ceased long ago. These great oyster shells, bleached white by the scouring of many tides, grew undisturbed until the oysters were killed by borers, or died of old age. The oysters that lived in these big oyster shells must have been twenty years or more old when they died, which is patriarchal for an oyster.

The spiny lobster, which is something new at the aquarium, is much like the common lobster in shape, but the peculiarly spotted and marked body of delicate shades of silver, blue, purple and amber makes it one of the most beautiful of crustaceans. This lobster is from Bermuda and has no pincers like ours, but from

its head are extended long, hard spines thickly covered with sharp stickers or needles similar to the cactus plant. In their native element they live the greater part of the time under the rocks. Before entering a crevice they use their long spines for exploring to find out if there is anything in it. If it is empty they turn around and back into it, leaving the spines sticking out of the entrance on guard.

CHICAGO AND THE WEST.

A Giant Pike.

CHICAGO, Ill., Aug. 1.—Every once in a while there comes very tangible proof of the fact that not all the big fish are caught as yet. For instance, each two years or so we hear of a very large large muscallunge being taken in Fox Lake waters of Illinois, only fifty-five miles from Chicago, and in a district literally infested with cottagers, "resorters," and all sorts and conditions of fishermen. Oddly enough, these big muscallunge of Fox Lake—and they are a genuine muscallunge and not the great northern pike—are nearly always discovered under singular circumstances. Two or three have been found dead on the shore, choked of their own rapacity. One was found, as reported in these columns, tangled up in the rushes and fast to a set line. Only very few have ever been taken with rod and reel, although every once in a while come stories of lost spoon hooks, of heavy surging strikes and monsters of the deep seen for a moment and then gone forever. These details might be classed as fishermen's stories were it not for the occasional absolute proof of their probability in the shape of these big muscallunge which are taken, dead or alive.

From Fox Lake to the muscallunge country of Wisconsin and Minnesota is a long jump, yet until one goes to the upper tributaries of the Mississippi which drain the great pine woods country to the north of us, there is hardly a water which produces the muscallunge. These big fellows in Fox Lake are simply there as the Skunk River and Des Moines River and Ohio River muscallunge are, or were, by chance, by survival, almost, one might say, by accident. We have, however, all through this western district, from the Ohio River north to the pine woods country, that other giant pike sometimes confused with the muscallunge, the great northern pike, the same fish which is commonly called pickerel all through this part of the world, but which is not in truth a pickerel, but just what it actually is, the great northern pike, neither a muscallunge nor a pickerel.

I remember stating in these columns some years ago the facts regarding the capture of two or three enormous pike in the little lake in Waukesha County known as Deep Lake, or Lulu Lake, or Schwartz's Lake, which is connected with Eagle Lake by a narrow rushy channel. This is the same lake on which J. B. H. and myself pitched our little camp for very many years in succession. We heard these stories of great pike, and one day had some reason to believe them, for J. B. H. brought up a great shiner bait cut in half as neatly as though by a pair of scissors. Billy Tuohy told us of one of these big fish which he himself had hooked and had up to the side of the boat. He thought it weighed 25 pounds. On still another occasion he was out with an angler who hooked a pike of about the same size, but which broke away. One day a farmer, casting frog along the shore of the lake with a long cane pole, had a heavy strike. He started inland on foot, and without halt or hesitation dragged out a great northern pike which weighed nearly 30 lbs. So much for confirmation of the repeated rumors of an occasional giant pike in this little lake, which is set like a beautiful gem among the quiet green hills of lower Wisconsin, one of the most beautiful regions that ever lay out of doors.

Now we come to the story in question. A few days ago Mr. W. L. Curtis, a salesman of A. G. Spalding & Bro., this city, went up to Billy Tuohy's place on Eagle Lake. He wanted to find the hidden bar out in the middle of the lake—the same bar which Billy Tuohy showed to J. B. H. and me, and where we caught our croppies and occasionally struck something heavier than croppies—but like most unskilled folk was unable to locate this little cone which rises up out of the bottom of the deep waters. Mr. Curtis was equipped with an ordinary bass outfit and started to troll with a spoon around the left edge of the lake as one goes in from the channel. When he got about opposite the little spring—the same spring which J. B. H. and I used at our yearly encampment—he felt a heavy surge on his line. What this big pike was doing over on that side of the lake I can't tell. Probably he was just wandering around in a morose and savage mood. At any rate, after about half an hour's hard fighting, Mr. Curtis got him up to the side of the boat. Happily he was provided with a combined gaff and landing net of his own invention. Several times, as in Mr. Tuohy's case, this big fish had escaped, because there was no way of getting them into the boat when brought alongside. Mr. Curtis gaffed this fish, and came back with it. It was a beautiful specimen, deep, fat and bright, and weighed just twenty-eight pounds. The fish is now in Chicago for the purpose of mounting. Mr. Curtis was accompanied in the boat by Mr. Horace Haff of Chicago. So much for beautiful little Lulu Lake. Since the death of J. B. H. I have never seen it, nor do I purpose ever visiting its shores again, but I am glad to see that it verifies to-day our beliefs of years ago.

For the Nepigon.

Mr. W. S. Forrest, the distinguished criminal lawyer of this city, is, like a great many other professional men, a very ardent devotee of the angle. Mr. Forrest leaves to-day, with his son, for a trip of some duration on the Nepigon. He takes a big outfit along, and is of course practically certain of sport among the great trout of that noble stream.

For Newfoundland.

Mr. George M. Eckels, of this city, is outfitting this week for a touring and trouting trip to the far off province of Newfoundland. At least Newfoundland

seems far off to a Chicago man, though its excellence as a sporting country ought to bring it very close to the attention and to the hearts of sportsmen East and West.

The Green Lake Country.

Green Lake, in Waushara County, Wisconsin, is in one of the best known summer countries in the West, and is pretty well taken up by wealthy cottagers who reside in Chicago and other cities. It is a deep and cold water, and is famous for its tremendous small-mouth bass, this fish being taken in great sizes at times, usually by deep fishing. The Green Lake bass might almost be called by a finicky scientist a distinct species of their own. They are athletic, bright colored, red-eyed, fighting fish, very much prized by anglers. The fame of these waters extends beyond the confines of the State of Illinois, as may be witnessed by the arrival in town yesterday of a party of Kentucky gentlemen who purpose spending some time at Green Lake and vicinity. These are Dr. Arch. Dixon, of Henderson, Ky.; Dr. L. S. McMurray, of Louisville, and Dr. J. Flexner, of the same city. These are names widely known in medical circles, even outside of the United States. All these gentlemen are anglers and are eager to learn something of the possibilities of the lakes and streams adjacent to Green Lake. Meeting Dr. Dixon by chance, I told him what I could about that country, including mention of the fly-fishing for small-mouth bass on the White River between Princeton and Neshkoro, this being along the northwestern line close to Green Lake station. Dr. Dixon laid in a supply of bass flies and went away with fire in his eye, determined to undertake certain negotiations with the red eyes of that pretty stream. "If you are ever down in Kentucky, sir," said he, "it will give any of us pleasure to meet you and to show you what sport we have in our country." How very like that is to that singular, unvarying and beautiful feeling of hospitality which prevails throughout the Southern States.

Good Bass.

At Eagle Lake, Wisconsin, last week, Mr. W. F. White, of Chicago, was lucky enough to take a big-mouth bass weighing 4 lbs. 14 oz., this being the largest reported from Waukesha County this summer, so far as known.

The Log of a Salmon Fisher.

Mr. C. H. Davis, of Saginaw, is good enough to send in an interesting extract from the log of his late salmon trip on his river, the Little Pabos, Gaspé County, P. Q. In this Mr. Davis includes more extensive mention of the singular incident reported last week of the salmon which broke away with the leader but was later killed on the rod. The record mentioned is as follows:

"C. H. Davis, June 22 to July 11, fished 15 days; W. S. Humphrey, June 22 to July 4, fished 9 days; M. W. Tanner, July 4 to July 11, fished 6 days. Total, 30 days. "Water very low during entire period, and big fish would not rise to fly.

"Killed 41 salmon; weight 346½ lbs.; largest, 20 lbs.; average, 8.45 lbs.; killed 4 grilse, weight 12 lbs.; average, 3 lbs.; killed 198 trout, weight 226 lbs.; largest, 4½ lbs.; average, 4.14 lbs.; total, 584½ lbs. Average per rod per day, 19.46 lbs.

"Log of July 7.—Warm and cloudy; showers after 3 P. M. Fished down river, leaving camp at 9 A. M. Francois reporting one salmon in Cora Pool (10 rods above camp), Davis started in there, while M. W. Tanner, of Saginaw, pushed on down with his two men and canoe. For some unaccountable reason, presumably by reason of the unusually low stage of water and consequent change of currents, we had so far been unable to raise more than one fish in Cora, which fish, after the first rush, settled back and sullenly refused every fly offered him. We had cast over a number of salmon in this pool on previous days without result, but a slight rise in the water last night seemed to have effect, and to the surprise of Davis, this one came with a rush at first cast, got well hooked, and after the usual mad rushes and leaps came quietly to gaff, and was laid away on a bed of snow in the ice house in less than twenty minutes.

"Davis and his crew then started down to look for Tanner, and around the second bend found him in earnest confab with his men on a little island at Bogan pool. It looked like trouble as we drew near, and sure enough it was, as Tanner had found three salmon in this pool, and getting a few quick rises from one, finally got fast to a bright 8½ pounder, just in from the sea, after which a few runs and leaps had succeeded in parting the line from the leader (the knot slipped), and they were mourning the loss of such a fine fish, to say naught of the three-dollar Boyd leader. Tanner's fish was cavorting about the pool, stirring up a large number of big trout that were lying about, and occasionally leaping out of water in his efforts to free himself from fly and leader. A council of war was immediately convened on the island, and Davis suggested that an effort be made to recapture the fish, and action was commenced at once by Francois taking the end of Tanner's line in his teeth, and putting out with Oliver and the canoe. They began to give chase, Tanner's boat joining in and following up the other boat, Tanner holding his rod, Davis guarding the rattle at lower end of the pool. Up and down the pool, up the Bogan and back again went fish and canoes. This continued for half an hour, when Mr. Salmon, after an attempt to run down the shallow riffle, returned to the pool and sought to hide under a log and limb, four feet under water. Oliver held the canoe steady, while Francois skilfully lifted the free end of the leader with his gaff, and quickly joined same to the end of Tanner's line. Then slowly drawing the line backward, so as to get the fish clear of the limb, the canoe was swung clear, leaving Tanner once more in command, and the bright and shining beauty, after a few more gallant struggles for freedom, was brought safely to gaff.

"Oliver, in his thirty odd years with salmon fishers, said he had never seen this trick successfully performed but once before, and as Francois remarked, we gave

the fish fair play, as he could easily have been gaffed in, as could one of the other two, which hid in the Bogan with his head under the bank. The day's record was:

"Davis, 1 salmon in Cora Pool, 8½ lbs.; 1 salmon in Stump Pool, 7½ lbs. Tanner, 1 salmon in Bogan Pool, 8½ lbs.; 21 trout, 24½ lbs.

"Salmon, before entering the rivers, are usually preceded by a small fish, called the capeling (I believe is the name), upon which they gorge themselves. This year the capeling had not appeared up to July 12, and the salmon are still stringing along, coming in, and are not quite as fat and fine flavored this year as usual, but good enough to eat, as I can truly assert, having had them on table at least once every day for three weeks."

Muscullunge and Frog.

Mr. Sam J. Ryan, of Appleton, Wis., writes in comment on the late statement regarding frog bait for muscullunge. "I notice you say 'One does not recall any instance of a muscullunge being taken on frog bait.' On Big Lake, in the Manitowish waters, two years ago I took a twelve-pound muscullunge with frog on a small bass hook, and on a seven-ounce rod. I picked up the fish just beyond the thoroughfare leading from Round Lake. I cast in the mangled frog again and raised another muscullunge, but he did not take much interest in the dead bait. If I had been able to find another live frog in that entire country I am sure I would have had more fish."

Of course nearly every one has taken pickerel, that is to say, great northern pike, on frog bait, more especially when used as a bait below a spoon. The frog, for one reason or another, is not commonly used by the muscullunge fishers of the Wisconsin district. Perhaps here is a tip very much worth bearing in mind by muscullunge anglers.

For Tomahawk District.

Judge Warwick Hough, of the Circuit Court, St. Louis, Mo., has for many years made trips into the muscullunge district of Wisconsin. In a letter at hand he says: "I shall hope, during the first or second week in August, to get away for a trip to Tomahawk Lake, near Minocqua. Mr. Southgate, of the Auditorium Hotel, Chicago, has a cottage near the Northwestern railroad, on Lac du Flambeau, northwest of Minocqua, where I understand there is fine fishing. Please inquire about this if convenient." Can any one give information of the desired sort? My own impression was that Flambeau Lake was pretty hard hit by the reservation Indians, but then one can never tell where the big ones are or when they are going to begin feeding.

Drowned by a Catfish.

I heard yesterday of a singular incident which happened on the Mississippi River near La Crosse. One of the river fishermen, by the name of William Renz, was out doing some night fishing, probably set line work, well towards the middle of the big river. He found himself fast to one of the big Mississippi river catfish, and in the struggle which followed the attempt to get the fish into the boat Mr. Renz was pulled overboard, caught in the current and drowned.

Fish Slaughter in Indiana.

The White River of Indiana has been in its time a splendid angling stream, containing among other attractions black bass which rise to the fly. It passes through a well settled district of the State and offers water power to several large factories. At Anderson, Indiana, are extensive straw board works, of course employing chemicals, and of course also discharging their poisonous refuse into the nearest stream. The result has of late been most disastrous to the fish life in the White River, and dead fish have lined the shores to such an extent that the Board of Health of Anderson has been obliged to collect them and burn them. About 14,000 pounds of dead fish were thus burned this week. We are a strange people, we Americans. We tolerate so much.

The Boss Story.

At Delavan Lake, Wisconsin, last week, a gentleman whose native modesty demands suppression of his name, performed a rather singular feat. While out bait-casting for bass he caught a live woodchuck. I have known bass fishermen thus to catch steel traps, muskrats, bullfrogs, bitterns, and other strange outfits, but I never did hear of a man catching a woodchuck while bait-casting with frog. I trust these New England gentlemen who take the woodchuck seriously enough to go out after him with a rifle will now mend their ways and pursue him in the far more sportsman-like method of the rod and reel.

Is the Sand Fly an Animal?

Evanston is a suburb of Chicago. Poundmaster Frederick Warren gets 50c. for every dead animal which he removes from the public streets of that village. There are four hundred million dead sand flies on the streets of Evanston. Now Mr. Warren is very anxious to know with legal accuracy whether or not the sand fly is an animal. If it is he can quit work pretty soon.

Doings at Oshkosh.

Mr. J. D. Carr, for the Winnebago Gun Club, of Oshkosh, Wisconsin, writes pleasantly as below, under date of July 24:

"Commencing August 22, and continuing for a week, there's goin' to be somethin' doin' at Oshkosh. The Common Council of the city has appropriated \$500, which will be largely augmented by private subscription—more than doubled—for the proper observance of the semi-centennial of this city, the ceremonies to be held on Thursday, August 27. The Inland Lakes Yachting Association holds its annual regatta here, commencing Saturday, August 22; and last, but not least, the Winnebago Gun Club will hold its annual tournament August 23, 24 and 25. Now, I know that

you have a soft spot in your heart for Oshkosh. If you could make it convenient to attend this series of good sporting events I am sure, if you did not enjoy yourself, the fault would not be entirely ours. You might slip a bass rod or two into your outfit, with other proper fixin's for seducing the small-mouth, and if conditions were favorable you might enjoy bass fishing on some of the finest waters in the world. By the way, one of the numbers on the semi-centennial programme is an address by Reginald Oshkosh, grandson of the old Chief Oshkosh.

"We expect you to say 'yea, verily.'"

I'm sure I wish I could, but cannot yet tell.

Try the Feather Duster.

Mr. J. E. Allen writes from Alpena, Mich.: "One good turn deserves another, and since you have done me one good turn, now please do the other. Accommodate me with some of the feathers you mention in the FOREST AND STREAM."

If I remember correctly, Mr. Allen refers to the make-up of the McGinty fly. The wing is the white-tipped turkey wing, and I think if he will go to the nearest feather duster he can find consolation.

Big Chicken Crop in the Northwest.

CHICAGO, Ill., Aug. 1.—During a visit to St. Paul, Minnesota, this week, talks with many different sportsmen convinced me that there is going to be a fine crop of chickens in Minnesota and the Dakotas this fall. Warden Fullerton, who is just back from a tour in the upper part of Minnesota, says that that country will be alive with game this fall. He thinks that Ottertail, Douglas, Clay, Grant, Norman and Kittson Counties will be the best districts to visit. The hatch in these counties is splendid and the greatest care is being exercised by the corps of deputies to prevent any "sooner" shooting. It is about this time that the "sooner" begins to get anxious.

There will be a little early shooting, of course, for it would be beyond human possibility to stop all of it; but it need not be stated that the wardens will be active. There will be birds in these counties of Minnesota when the season opens, and there will be good shooting there for a week or ten days after the season begins.

In the southern counties of Minnesota the crop is not so good this year. As may be remembered, we have had a very wet season in this part of the United States this summer and spring, and the nests were drowned out over a good part of Iowa and lower Minnesota. A visitor would do better to keep further north and in the counties above mentioned.

Sportsmen from North Dakota say that their chicken crop is going to be a record one. The sentiment against excessive and illegal shooting is growing in this part of the Northwest, and there will be very many points along the Great Northern and Northern Pacific Railroads, in North Dakota, where fine sport with chickens and ducks can be had. There is rather an unusual abundance of local ducks. Weather which is bad for chickens is sometimes pretty good for ducks.

In South Dakota the chicken crop will be as good as last year. Different residents of South Dakota towns reported at the St. Paul gun stores that they were quite satisfied with the prospect for the fall. The Milwaukee & St. Paul road is a good one to have in mind for South Dakota.

The Auto and the "Sooner".

Deputy Warden A. S. Carmichael, of Lescoe, Minnesota, has an automobile. Rev. Henry Rifforty, pastor of a church at Lescoe, has a taste for quail. He wanted quail so bad this week that it just seemed to him he could not stand it any longer. The warden was out after "sooner" quail shooters and discovered Rev. Rifforty endeavoring to appease his desire for quail. The latter proved to be considerable of a sprinter, but the deputy followed in his automobile, overtook the offender, carried him to town and had him fined and reprimanded by Justice Distel. This is a hard world, and eke a speedy one betimes.

E. HOUGH.

ASHLAND BLOCK, Chicago, Ill.

Reunited by a Fish Story.

OYSTER BAY, L. I., July 30.—John Franklin has a hotel here, with a trout pond adjoining. He keeps his beer kegs in the pond. Recently a story was published that one of the kegs had sprung a leak, and that the beer flowing into the pond had reduced the trout to a disgraceful state of intoxication.

This story was read by Mrs. Frederick Nottrott, who lives in Brookfield, Mo., and she wondered whether the John Franklin mentioned was the brother whom she had not seen for so many years.

Mr. Franklin received to-day a letter from Mrs. Nottrott in which she said that she did not know whether she was writing to her brother, but was anxious to find if they were related. Mr. Franklin says that he has no doubt that his correspondent is his youngest sister, whom he has not seen since June, 1863. He says he will write to her immediately, and if she proves to be his sister will pay her a visit at the first opportunity.—New York Times.

Wisconsin Fishing.

MILWAUKEE, Wis., August 1.—Sidney L. Knowles, of Lakewood, Ohio, and myself broke the record of one day's fishing at Oconomowoc, Wis., July 25. We caught three gar pike, three catfish, twenty-one bass and 119 roach, a total of 146 fish, weighing 118 pounds.

Mr. Sidney L. Knowles and wife broke this year's record of one day's fishing at Pewaukee Lake, Wisconsin, July 29, by catching 19 bass and 102 roach, weighing a total of 98 pounds.

ED. PULLMAN.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

The American Fisheries Society.

We supplement the report in our last issue of the meeting of the American Fisheries Society with a summary of the papers and discussions. For the abstract we are indebted to Secretary George F. Peabody.

A paper by Mr. S. P. Bartlett, of Quincy, Ill., was read on "Angling for Carp," and some hints as to the best mode of cooking. The writer said that the best bait was a dough ball made of oatmeal mush worked hard with cotton batting. The prejudice against carp as a table food arises from improper cooking. The carp furnish equal sport for the angler with game fish, are a good wholesome food, and have come to stay.

Mr. Clark thought the carp had come to stay in the Great Lakes as a commercial fish, and that it was not hurting the other fish at all.

Mr. Willard read a paper by Mr. A. D. Mead, of the Rhode Island Fish Commission, on recent advances on lobster culture. He said that the Rhode Island Commission had solved the problem of protecting the fry by using an apparatus to keep the water in motion, so that the fry will not sink to the bottom and perish, and has also devised apparatus by which the fry can be carried through the swimming stages in large numbers, and also apparatus to hatch lobster eggs. Young lobsters have been kept through three successive winters by sinking them in small cars to a depth of about eight feet in water. Improvements are to be looked for in perfecting the transmission machinery, and in protecting fry from parasites.

Dr. James A. Henshall read a paper on "Blood as Fish Food." The writer said that the results of this manner of feeding both fish and fry are so encouraging as to warrant its continuance.

Mr. Titcomb thought blood was very good for the early stages of the fry.

Mr. Atkins said that he had been using hogs' plucks at the Craig Brook Station, with excellent results for many years. Between May and October of last year the cost of feeding 447,000 fry was \$262.52, or 4½ mills per fish—about half what the cost of butchers' offal would be.

Mr. Seymour Bower said that he fed sheeps' plucks to the fish and preferred them to hog's liver, but in the summer months he alternated that with Lane's food.

Mr. Seagle said he fed his small trout fry with her- ring roe.

Mr. Charles G. Atkins read a paper on the "Live Food Problem." He discussed all the possible sources of live food, including other fishes, water insects, shrimps, daphnids, and other crustacea, water snails, aerial insects, anglerworms, etc. Lugin's tank method of growing daphnia, etc., was described; also Von Scheidlin's method of odorless production of maggots. Other methods of production of maggots were also described.

Mr. W. F. Hubbard, of Nashua, N. H., read a paper on "Transportation of Green Brook Trout and Salmon Eggs." It is not advisable to attempt to move green salmon eggs, he said. Green brook trout eggs may be transported with small loss.

Mr. Clark said that green brook trout eggs could be transported at any time with safety, until the critical stage is reached, which is about the eighth day.

General Bryant, of Madison, suggested that the problem was first to avoid the least shock to the eggs when they were at the critical stage; second, to use pure water, and third, to keep it at the right temperature.

Rev. E. M. Waterhouse, of Providence, Rhode Island, read a paper by Mr. D. B. Fearing, of Newport, on "Some Early Notes on Striped Bass."

At the conclusion of the history the writer said that the most successful introduction of fish to waters previously foreign to it, has been the introduction of striped bass into California waters. With such phenomenal results achieved by nature alone in California, why should not our own coast once more be made to teem with pools of striped bass, as of yore?

Mr. S. G. Worth, of Edenton, North Carolina, gave an account of his study of the striped bass as found in North Carolina waters. He said that about ten years ago there was an immense catch of striped bass in spawning condition, made with sturgeon nets at Edenton; that these catches are not regularly made is due to the fact that it is only occasionally that the bass are driven down the river by muddy water. This striped bass makes for the rapids of the river, and there deposits its eggs in places inaccessible to the fisherman until the water begins to fall and the fish drop below the falls at Weldon, and are taken with dip nets.

This year from the 6th of May and for a week following, we encountered spawning fish and were amazed at the great quantity of eggs obtained from the individual fish, and also at the enormous field which seemed to open up there for practical work by the Fish Commission. The writer says: I personally estimated that I took one million five hundred thousand eggs from a single 20-pound fish caught at Roanoke Rapids. This year I witnessed hundreds of rock fish (striped bass) fights at Weldon. I had heard of this thing before, but never had seen it. The spawning female fish is often surrounded by from twenty to fifty small male fish weighing less than two pounds each, and these small fish appear to be the only ones that mate with the female. They are known there as perch rock, because they are the size of a perch. The fry stands any amount of transportation, and we get about a third the number of fish that we have eggs.

The Huntoon Oyster Company, of Fairhaven, Washington, presented two boxes of specimens taken from the oyster beds at Samish Bay, Skagit county, showing samples of native oysters as caught in seed form showing shells of ten months' growth averaging as large as a 50-cent piece. The material used as a catcher is cast-off salmon netting. Scrap tin, bark, shells, gravel and other means of taking seed have been tested, but the results of the netting have been the most satisfactory.

Mr. John D. Whish, Secretary of the Forest, Fish and Game Commission of New York State, made an address, giving some notes on the work of the Forest, Fish and Game Commission of New York State, with

special reference to commercial values, showing that the estimated cash value to the people of the work done by the Commission far exceeded the amount of money used by the Commission.

Dr. Tarleton H. Bean read a paper by Mr. Samuel Lovejoy, of Georgia, on "Fish on the Farm—What Fishes to Select." The writer said that one of the greatest mistakes was in overstocking the ponds; and that the arranging of the pond and embankment should be carefully planned; then stock your pond with the speckled catfish, the blue gill bream, or the Warmouth bass.

Mr. Titcomb said that the main trouble with most people that build these artificial ponds comes from the fact that they most always choose a ravine or some place where they can throw a dam across, they stock it, and the whole thing goes out in the following spring.

Mr. Titcomb exhibited various specimens of bass and bass fry, illustrating, among other things, the cannibalistic tendencies of the fish.

He then read a paper by Mr. J. J. Stranahan on the subject of "Three Main Points Necessary to Successful Bass Culture." These points are what brought the Cold Spring, Georgia, station of the United States Fish Commission from comparative failure two years ago to success this year. He said: "Ship all the baby fingerlings, secured just before the brooks break up, with us one to one and a half inches long, that you possibly can; keep all fish except the kind you wish to propagate entirely out of the ponds; feed enough to keep the parent fish healthy throughout the year, and keep them full during breeding season in order to prevent them from devouring large numbers of what will make your fingerlings; see that you have abundant cover to hide your fry, baby fingerlings and fingerlings, and to make a good home for your adults, and all else will come to you."

Mr. J. N. Leary, Superintendent of San Marcos Station, Texas, then read a paper on "Propagation of Large-Mouth Bass at San Marcos Station." Nothing but fish varying from two to six inches in length are shipped from the station, and success may be anticipated in black bass propagation if the plan of plenty of room and abundance of food is adhered to.

Mr. Clark being about to construct small-mouth bass ponds at the Northville, Michigan, hatcheries, asked about the proper depth of water.

Mr. Leary advised that the spawning area run from three feet to nothing, this shallow water affording opportunity for plenty of insects and plant life for fry food, and that in the climate of Michigan a maximum depth of the kettle of fifteen feet would not be too great. The point is to keep the water from freezing at the bottom, and to have no dead water. This was the consensus of opinion of the bass men.

Mr. Lydell suggested that most of the propagators were dealing largely with large-mouth bass, while the problem which Mr. Clark was called upon to solve was one concerning small-mouth bass, and that conditions varied so much in each locality that Mr. Clark would have to do a good deal of experimenting for himself.

Mr. Titcomb suggested that inasmuch as Mr. Clark intended to build five ponds, it would be a good idea to try depths running six, ten, twelve and fifteen feet, to determine experimentally which was the best depth. If the greater depths were found better, the shallow ponds could be deepened.

Instances were mentioned by Mr. Henry W. Beeman, of Creston, Conn., of a second or even a third spawning of bass, the three different spawnings being two or three weeks apart.

Mr. Lydell mentioned an instance that came under his notice of one female spawning on two separate nests with two male fishes; also an instance of second spawning, at Grand Rapids.

Mr. Leary mentioned a bass that spawned twice, where the identification of the fish was perfect, for the reason that it was blind.

Mr. Beeman described his experiments and experience as an amateur in breeding small-mouth bass. The re-stocking of small lakes with black bass by private enterprise seems a possibility, according to the experience given by Mr. Beeman in Lake Waramaug. The small cottagers on this lake, through information received from the proceedings of the American Fisheries Society, furnished Mr. Beeman with the necessary means for constructing a private bass hatchery. This hatchery was completed one year ago, and Mr. Beeman has deposited about 240,000 young bass in the lake. Using the experience of the older fishculturists in the cultivation of black bass, Mr. Beeman seems to have achieved marked success as an amateur. His experience will be printed at length in the proceedings of the American Fisheries Society for 1903.

Mr. Seymour Bower said that the Fish Commission in Michigan had the greatest proportionate success in raising small-mouth bass in its earliest experiments, and that the early successes of the Commission were largely attributable, he thought, to good luck. He said further that Prof. Reighard attributed the non-productiveness of many beds to a lack of vitality in the parent fish, or in the eggs themselves, as the eggs of the non-productive beds were found to be fertilized.

Mr. Dean said the production of bass was a question of procuring natural food and moss for them. As the pond vegetation varies greatly the problem is most perplexing.

Mr. Titcomb and Mr. Leary suggested that the trouble in regard to vegetation would be obviated if the pond were drawn down at the proper time, which would be in October.

Mr. Lydell and Mr. Ravenel thought the conditions varied so that every bass station must solve its own problems.

Mr. F. N. Clark, Mr. Seymour Bower, and Mr. W. DeC. Ravenel were appointed a committee of three to present a report making a distinction in the use of the terms "bass fry" and "bass fingerlings."

Prof. M. C. Marsh, of Washington, D. C., read a paper on "A Fatality Among Fishes Containing an Excess of Dissolved Air." This paper referred to trouble at the Woods Hole Aquarium due to the fact that air leaked into the suction pipe of the pump and resulted in over-aeration of the water and consequent death of

the fishes. He said the excess of air may be removed by allowing the water to fall into the aquarium from above in a shower. Another cause of similar symptoms is change in water pressure, as when a deep sea fish is brought into a shallow aquarium; another cause mentioned was bacteria.

Mr. W. T. Thompson read a paper on the subject of "Golden Trout," one of the least known but most beautiful of New England fishes. He said that the essential characteristics of the golden trout are that he is a bottom feeder, and inhabits deep and cold waters. The writer has observed in rearing these fish that the young fish are most active and healthy and make the most rapid growth in the severe winter months; and the marbling on the back is a means of distinguishing it from the brook trout.

The President read a paper by Prof. Henry B. Ward, of Nebraska, on "Some Notes on Fish Food in the Lakes of the Sierras."

Wednesday, July 22, 1903, at 2:30 P. M., the memorial services in honor of Spencer Fullerton Baird were held on the grounds of the United States Fish Commission. The meeting was called to order by President Bowers, who said:

"At a former meeting of the American Fisheries Society a resolution was passed suggesting the erection of a tablet to the memory of Prof. Spencer F. Baird, as an appropriate tribute and recognition of his distinguished labors in behalf of station fisheries and biological science. A committee was appointed to raise the necessary funds, and has faithfully performed its duty, so that we are here to-day to dedicate this memorial. It is especially fitting that such tablet should be erected at Woods Hole, the scene of so many of his scientific achievements, and where his life labors ended."

A tablet of bronze upon a huge granite boulder and veiled with the American flag was then unveiled by Miss Rose McDonald, Miss Eleanor Bowers and Mr. Vinol N. Edwards. The inscription on the tablet reads:

"In memory of Spencer Fullerton Baird, U. S. Commissioner of Fisheries 1871-1887, the American Fisheries Society places this tablet in appreciation of his inestimable services to ichthyology, pisciculture, and the fisheries. 1902."

E. W. Blatchford, L.L.D., of Chicago, delivered the memorial address. He said that Prof. Baird became an officer of the Smithsonian Institution in 1850. In 1874 the office of Commissioner of Fish and Fisheries was established and he promptly received the appointment. Prof. Baird was a man of indefatigable activity of body and mind. The list of his works, as issued in 1883, embraces 1,063 titles, 73 relating to mammals, 80 to birds, 43 to reptiles, 431 to fishes, 61 to invertebrates, 16 to plants, 88 to geographical distribution, 46 to geology, mineralogy and paleontology, 45 to anthropology, 31 to industry and art, and 109 to exploration and travel. The tireless devotion of Prof. Baird to science is shown by the number of his contributions, breadth of research, and thoroughness of treatment; and during all this time Prof. Baird shared the burden of the administration of three great organizations, the Smithsonian Institution, its ward, the National Museum, and the Fish Commission. Every civilized country paid him honor. His modesty was impressive; he was approachable and genial, and possessed a marked aversion to personal controversy. During his last illness at Woods Hole for everyone he had words of good cheer, well knowing that they were words of farewell. The end came when, after a brief period of unconsciousness, he breathed his last August 19, 1887.

Prof. William K. Brooks, of Johns Hopkins University, a warm personal friend of Prof. Baird's during his last years, delivered the next address. He said that Prof. Baird increased the efficiency of the Smithsonian Institution; conceived and put in execution the plan for a national museum; was one of the founders of the National Academy of Science, and that he was the father of the Fish Commission.

Mr. Frank N. Clark, an early appointee of Prof. Baird's, and now President of the American Fisheries Society, then addressed the meeting. He spoke feelingly of the inspiration that all who associated with Prof. Baird derived from him.

Mr. Livingston Stone, of Rhode Island, another early appointee of Prof. Baird's, read from a copy of FOREST AND STREAM of date of February 12, 1898, being a paper read by Mr. Stone before the Fisheries Society meeting of that year. The portion of the paper referring to Prof. Baird was as follows:

"The other figure which stands out most prominently in my memory, as I recall the early days of American fishculture, is that of one who has been called a plain man. He was a plain man, indeed, but one who was made after nature's largest pattern of men. He was large in mental caliber and large in physical frame, large in his broad sympathies and in his wide scope of vision, large in his comprehensive grasp of great aims, and large in his capacity for great undertakings—large in everything, but small in nothing. You at once recognize, I know, Prof. Spencer F. Baird, the first United States Commissioner of Fish and Fisheries."

"The mere mention of Prof. Baird's name strikes a chord of dear memories in the hearts of all who knew him. No man of our time has left a purer memory, a more stainless name or a more animated or enduring influence over his special field of labor than Prof. Baird. He was loved by those who knew him when he was living; he is revered by those who have survived him. Prof. Baird lived in a higher plane of life and breathed a purer atmosphere than most men. Quiet and unassuming, with a nature as gentle as a child's, his natural superiority never failed to show itself when he was with other men, not even among the distinguished men who gathered in the winter at the national capital. Yet he was thoughtful and considerate of his subordinates, and always ready to give his meed of praise of any work well done by his humblest employe. Prof. Baird had the enviable gift not only of endearing every one to him who came in contact with him, but of inspiring them with his own enthusiasm and energy. This made Congressmen vote him all the appropriations that he asked for; for it was a common saying at Washington that Congress gave Prof. Baird everything that he wanted. Like a good general he had the personal welfare of his men at heart while he was Fish Commissioner, and they

in turn wanted to do everything in their power for him, which, doubtless, was one of the secrets of his great success. It is a fact that his employees in the Fish Commission would voluntarily work a great deal harder for Prof. Baird than they would for themselves. This fact is prevalent for another saying at Washington at that time, that Prof. Baird's men were the busiest workers in all the departments. It was the inspiration of this patient, disinterested, tireless, kind-hearted and lovable man whose work they were doing that made them work so well, and also made their work a pleasure.

"It is unnecessary to say that Prof. Baird possessed extraordinary mental endowments, but I perhaps may mention one or two, as they are so rare. He had a quickness of apprehension that sometimes seemed supernatural. For instance, he would glance down a printed page and comprehend in a moment what would take others several minutes to read.

"He had a marvelous memory, not only retentive of everything intrusted to it, but quick to call up anything that was wanted when it was wanted—a quality which most of us know well how to appreciate. His mind was also of the clearest type. No complications ever seemed to confuse him; he never became involved during his conversation, no matter what were the intricacies of the subject. His mind, like his placid temper, never seemed to be ruffled or disturbed. Extraordinary as his mental faculties were, he had evidently added to their efficiency by severe discipline, for he possessed that infallible mark of a well-trained mind, of having all of his great and diversified stores of knowledge classified and grouped together in his brain according to subjects, so that he could call up his whole knowledge of any subject at a moment's notice. Another remarkable thing about Prof. Baird's mental composition was that with a thoughtful, scientific cast of mind were united qualities of the most practical character. Prof. Baird was a scientific man by nature. He loved science and scientific studies; but at the same time no man had a sounder judgment or a clearer head in the management of practical affairs than he did. It is very rare to see scientific and practical qualities of mind united in such an eminent degree as they were in Prof. Baird's.

"Prof. Baird was gifted with still another unusual mental endowment which reminds one strongly of one of the traits of the first Napoleon. With that comprehensiveness of mind which takes in the broad features and large general outlines of a great enterprise, he combined, as Napoleon did, a capacity for close and thorough attention to all the details of a subject down to the minutest item necessary to success. This combination, as we all know, is a rare one. As an illustration of Prof. Baird's wonderful retentive memory and easy grasp of details, as well as his gift, also remarkable, for a rapid dispatch of practical work, I may mention a little incident that occurred at Calais, Me., where I visited in 1872, and which has fastened itself on my mind ever since. He had received twenty-seven letters by mail of the day before—I remembered the exact number that he told me he had received—and the next forenoon after breakfast he called in his stenographer for the purpose of answering them. As I very naturally rose to leave the room, he kindly invited me to remain and be seated, and I shall never forget the impression which the subsequent answering of those letters left on me.

"Assuming his customary attitude, when on his feet, of holding his hands behind him, one wrist grasped by the other hand, he leisurely walked up and down the room, dictating to the stenographer the answers, one after another, to all his letters. He did not, to my knowledge, refer to one of the letters he had received, either to ascertain its contents or to get the address of the writer, but proceeded from one letter to another till all were finished. And; further, during this time he never showed the slightest hesitation, nor did his countenance betray any signs of mental effort or confusion. It was a remarkable feat of memory, and a methodical dispatch of business details which I cannot forbear to mention.

"In our subsequent acquaintance and correspondence, which was very extended, both personal and official, his letters were always marked by great kindness of heart and thoughtful consideration, which, it is needless to say, warmly endeared him to me. It is a great pleasure to me now to think that the United States Fish Commission station that I located and built up three successive times, on the McCloud River, in California, has kept the name which I gave many years ago to the little post-office on the river, and as Baird's Station contributes its mite to perpetuating the name of the great first United States Commissioner of Fish and Fisheries."

Fish and Fishing.

One Cause of Good Fishing.

FROM correspondents in the old country I learn that pretty much the same causes have operated in North Britain as in Canada to bring about good salmon fishing in the latter part of the season. In Scotland, the January sport, and also that in the latter part of February and early part of March was very much militated against by heavy floods. Exactly the same thing happened in Canada, though this was subsequent to cold weather in the early part of June, which furnished insufficient water for the fish to enter the rivers. These heavy floods are precisely what the angler desires in the early part of the season, as clean fish are thereby enabled to run up from the sea and the kelts are washed away down the rivers. On many of the rivers it is impossible to haul a net when the flood water is running strongly, and so the salmon have an extra chance to escape capture and to reach the upper pools in safety. This was particularly the case in the middle of June this year in Canada, and as a consequence, all the salmon rivers have been full of fish ever since, not only insuring good sport for anglers but a bountiful supply of young fish for future requirements.

Biggest Salmon.

An English newspaper having said the other day that a 54-pound salmon killed this summer by Mr. F. Milburn on the Shannon, which is just the weight

of the record fish on the Cascapedia, was about the largest ever taken by rod and line, a writer in the Westminster Gazette, who signs the initials "R. C. D.," very properly convicts the statement of error, pointing out that in previous years a fish of 58 pounds was credited to the Shannon, and one of 57 pounds to the Suir, among Irish rivers, though he expresses the belief that to the Tay belongs the credit of yielding the biggest salmon ever taken with rod and line in the British Islands. It weighed 61 pounds and was caught in the year 1870. In the same year a splendid fellow of 70 pounds was taken in the nets of the Tay estuary. It was sent by Mr. Charles, the well-known fishmonger, to Frank Buckland, the eminent authority on salmon problems, who took a cast of it which he preserved in his museum. During the past few years, too, salmon of 55½ pounds, 53 pounds and 53 pounds have been captured with rod and line on the Tay, and not a season passes in which fish scaling 40 pounds and over are not secured by the rods. Nevertheless, it is probable that the Shannon can claim the best average, though it seems to have been growing rather uncertain of late years, consequent—so it is affirmed by those who should know—on over-netting. In 1896 twenty salmon that scaled 40 pounds or over were killed on the Shannon. In the spring of 1902 twenty fish were landed which averaged 35½ pounds apiece, and later in the same spring seventeen fish gave an average of just under 30 pounds each.

But these figures sunk into insignificance when compared with the doings of anglers in British Columbia, though that is altogether a different story, the salmon being of another variety, and having the serious defect of failing to appreciate the attractions of artificial flies, though to a spoon bait they come freely. In 1897 Sir Richard Musgrave and Mr. H. W. Gordon, R. E., had wonderful sport on one of the rivers of Vancouver Island. In the course of a few days they killed—in addition to smaller ones—fifteen salmon, of which the largest weighed 70 pounds and the smallest upwards of 40 pounds. In the same island in 1901 two anglers landed salmon of an aggregate weight of 5,242 pounds in nineteen days. The heaviest fish turned the scale at 58 pounds, and eleven weighed 50 pounds each or more.

E. T. D. CHAMBERS.

A Two-Headed Shark.

THE accompanying illustration, showing a "freak of nature" in the shark-life inhabiting the harbors, inlets, and ocean waters of New South Wales, is the first instance of its kind known to Australian ichthyologists. My eldest son, who for nearly thirty years has resided in New South Wales, writes me to the above effect.

The fish in question belongs to the species known as the "Pointer" shark, and was captured a few weeks ago by a fishing party off the coast near Wollongong. The

mother shark measured eight feet in length, and appears to have been viviparous, for on being cut open it was found to contain this and some thirty other young live sharks ready to be extruded. The one under notice, of which we give an illustration, was a "twin" or double shark, about nine inches long, joined together from below the breathing orifices (its gills), and whether this young one would have grown up and attained the size of its parent is hard to conjecture; but most people will agree that sharks with one head are less than satisfactory from every point of view, and that the possibility of anyone when swimming, accidentally meeting with a full-grown double-headed monster will be of considerable interest at this time of the year, when so many thousands will be indulging in the delight of surf and ocean bathing.—London Fishing Gazette.

Massachusetts Trout Season.

THE trout season in Berkshire, Franklin, Hampden, and Hampshire counties closes July 15. Mr. Charles Hallock, who is summering in western Massachusetts, writes to the Hampshire Gazette:

"I note your reference in last Thursday's issue to the limited season for trout fishing in northwestern Massachusetts, and agree with you that it should be extended to August 15. This is the old date, I believe. The new law was enacted with the notion that the less trout taken this year the more would be left for next year; which is good enough logic, but a drawback to sport. Most summer guests from the cities take their vacations in August, and are disappointed in being debarred from fishing. The brooks are the main attraction to a large proportion, and if they are to be closed, many visitors will not come."

Capture of a Rainbow Trout in London.

ON Thursday last Lord Denbigh sent up for me to see a perfectly lovely rainbow trout which he caught the previous evening in the Buckingham Palace lake. The fish was in the pink of condition, quite plump; in fact, weighed nearly ten ounces, and was about eleven inches in length. It was caught by Lord Denbigh on a small black hackle fly, and fought most gamely. If the other rainbows have done as well as this the royal family will have some good sport. I imagine it is the first trout ever caught with the fly in the middle of London.—R. B. Marston in London Fishing Gazette, July 25.

The Chicago Pound.

2541 PRAIRIE AVENUE, CHICAGO, July 22.—*Editor Forest and Stream:* If my memory serves, you have ever been on the side of humanity. I have herewith inclosed a slip from the Chicago Daily News. I beg you to read it, and to make your protest heard, and, if possible, heeded. This is one of the horrors frequently occurring in this terrible city. The writer visited this dog inferno, and feels that no pen can describe the scene. Big strong men present choked with emotion. The feeling produced was a sort of frenzy in the observer, with a desire to run at top speed from the horrors.

Civilization can evolve the worst things in man possible under any conditions.
PETER FOY.

Starvation, overcrowding and other torments which fall to the lot of hapless canines at the dog pound were today called to the attention of the Humane Society, which has the pound under its supervision for investigation. Several citizens who have visited the pound of late declare that conditions there are almost barbaric, and that the suffering endured by unclaimed curs awaiting death or release is worthy of inquiry. These reports have been investigated by a reporter for the Daily News, and John G. Shortall, of the Humane Society, and in general charge of the pound, was appealed to to have the matter looked into.

This afternoon Mr. Shortall called up the pound on the telephone and talked with the officer who is stationed there.

"Such conditions are an outrage," said Mr. Shortall after inquiry. "They will not be tolerated. The dogs are entitled to decent treatment while they are alive. The overcrowding must cease. Screens must be placed on all of the windows and the food will be required to be sufficient."

Mr. Shortall was informed that fifty loaves of bread were purchased each day as food for the dogs. Sometimes, it is said, there are as many as 300 dogs at the pound, and all of these are fed from the fifty loaves.

Packed so closely there were hardly room for all of them to lie down and covered by millions of flies, more than sixty-five dogs were yesterday awaiting death at the pound. They were in a pen which was scarcely twelve feet square and which reeked with foul odors, not alleviated by the presence of a garbage dump a short distance away.

Many of the dogs had open sores upon their haunches or necks, sores which in most cases had come from fighting in the pens in which they had been confined with scores of other strange canines. These were made worse by the onslaughts of the swarms of large flies bred in the garbage dump. Yelps, barks and heart-sickening moans came from the animals in the pens as a protest against the conditions in which they were forced to pass the last five days of their lives. Today is "killing day."

All of the dogs are kept at least five days before being killed. Those which are found to be licensed are separated from the others and kept ten days, during which time their owners are found and notified. The others are divided and placed in cages, the males in one and the females in another. Each day the animals are removed to another cage, there being always one vacant cage ready for the return of the wagons of the dog catchers. It is after the cages have been emptied of the dogs that they are supposed to be cleaned. Saw-

dust to the thickness of almost an inch is then strewn on the cement floor.

Five cages are provided for the transferring, the sixth change being to the death chamber. As the dogs are only killed each alternate day, those which have been caught on two days are thus brought together and placed in the same No. 5 cage, twelve by twelve feet.

[The proper remedy would be to build larger quarters, equipped with modern appliances and methods of sanitation. That can be accomplished only by local effort and local capital. Mere expressions of horror or sympathy on one hand, with an unloading of the responsibilities on the other fellow on the other hand, is not the correct procedure.]

Bloodhound vs. Mastiff.

Your correspondent, Von W., objects to the identification of the bloodhound with the old talbot hound, saying that he has always understood the talbot to be the old English mastiff.

I sincerely hope he will give the facts which cause him to disagree with myself, and also all of the best authorities on the subject. The truth of this matter, as well as with all other matters which are the subjects of discussion, should be the object sought, and I wish to assure Von W. at the outset that I am always open to conviction, and will cheerfully admit that a hound is a mastiff, or a mastiff is a hound, whichever way he wants it, if he will cite the facts necessary to prove this paradox.

However, as the case now stands I think the facts are somewhat against his understanding of the matter. I would call his attention to the following quotations from an article entitled "The Bloodhound," which he can find in Century Magazine for June, 1889.

The author of the article is Edwin Brough, who is a recognized authority on the subject. He says: "All the best authorities agree that the St. Hubert, talbot and bloodhound are all very closely allied. The breed (bloodhound) originated from the talbot. It is only in very old writings that we find talbots, or white bloodhounds, mentioned. The talbot was the popular hound from the twelfth to the sixteenth century, but became extinct about the end of the last century." Now the English mastiff is not extinct; therefore the talbot which became extinct could not have been the mastiff which is not extinct. Attention is especially called to the following quotation: "Each keeper in the New Forest was required to keep a couple of bloodhounds on his walk. They called them talbots, and one keeper named Primer used to boast that he had had the breed in his family for more than three hundred years." Then Mr. Brough says that Thomas Nevil procured one or two couples of these hounds from Primer. That they were described as being very much like our present bloodhounds, and that they were called St. Huberts. We must infer from this that the St. Hubert, talbot, and bloodhound were so nearly identical that these names were applied to these hounds indiscriminately.

I can nowhere find any evidence to show that these hounds were noted for a propensity "to grip and hold on." On the contrary, there is plenty of evidence to show that they had no such propensity. The dogs of Nevil would hunt stags, which were kept in a paddock for that purpose, and then would amicably trot home side by side with the stag which was used in the hunt. Then there was a tame jackal which these hounds hunted occasionally, with which they lived on the most friendly terms between hunts. Here we have a prominent trait of the bloodhound of the present day accurately portrayed. I could quote other authorities at great length to show that the bloodhound is descended from the old talbot hound, but at this juncture I think it is unnecessary. Perhaps I may have reason to change my mind when Von W. presents his side of the case.

Possibly the name talbot was given to a few mastiffs which were owned by a family of that name, but I fail to see why this should be accepted as evidence that the talbot hound never existed, or that the bloodhound is not descended from the talbot hound.

As well might one believe that the ruffed grouse is the only partridge or pheasant that ever existed, simply because it is called partridge and pheasant in certain localities.

Jos. W. SHURTER.

GANSEVOORT, July 30.

Long Story of a Long Chase.

BRENNAM, Texas, July 25.—A story of a long deer chase, which may prove interesting to your readers, was told here by Dr. S. Bowers, a prominent physician, whose veracity is unquestioned, a day or two ago, and illustrates the endurance of the breed of deer hounds we have in this section.

Dr. Bowers is not a hunter, but is exceedingly fond of lingering along the banks of a stream where trout haunt the deep pools at the big bends; and it was on one of these excursions down on Mill Creek when they were biting a few weeks ago, that he heard a single hound yelping as if it was after a rabbit coming down the swamp not far from the creek.

Instinctively he turned his head to catch a glimpse of the game, which he knew must be far in advance of the dog, and saw three deer going with the speed of the wind down the swamp. He listened to the music for a mile or more and it passed out of hearing.

Three weeks later he made another excursion to Mill Creek, and was sitting at the same trout hole, and had made a fairly good catch, and was just thinking of moving, when he heard a single yelp away off down the swamp, and recognized the voice of the same dog, which had a peculiar sonorous bass voice, though he was seemingly only giving tongue about every 150 yards. Presently he saw the same three deer loping slowly by, close enough for him to recognize them as the same deer, and pretty soon here came the dog, going at the rate of about four miles an hour, with its tongue hanging out as if it was almost tired out.

Dr. Bowers recognized the deer and dog as being the same that he had seen go down the swamp three weeks

previously, and while he says that some might question his veracity if he was to say that the dog had followed them all that time, the circumstances all indicated that it had. He knew it was the same deer and the same dog; he saw them go down the swamp along the same route, and he saw them come back, and every indication was that the dog had followed them all that time. How is that for staying qualities in a hound pup?

GEORGE TUCKER.

Honor for Foxhounds.

ORATOR, a famous foxhound, owned by R. D. Perry, of Phillipston, died recently of old age. Orator was well known to nearly every Worcester fox hunter and members of the Worcester Fur Company and the Brunswick Fur Club. He was Mr. Perry's favorite hound and was the hero of many a great run at the winter meets of the Brunswick Fur Company, where his merits won a reputation that extended beyond Massachusetts. He, with Clunker, his kennel mate, and winner of the Brunswick trials in 1891, lies buried on the slopes of Broad Mountain, Phillipston, in the midst of the hunting ground that so often echoed to their cry. They rest at the foot of a great boulder on which are chiseled their names and the inscription, "My favorite foxhounds."—Worcester Post.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

America's Cup Races, Aug. 20 and alternate days. AUGUST.

5. Chicago, race to Milwaukee.
- 5-8. Corinthian Marblehead midsummer series.
- 6-8. Indian Harbor, Y. R. A. of L. I. Sound, specials and annual.
- 7-8. Pass-Christian, Southern Gulf Coast Y. A., Pass-Christian, Miss.
- 7-8. Milwaukee, open.
- 7-8. Lake Michigan, Y. R. A., meet at Milwaukee for all classes.
8. Seawanhaka Corinthian, club, Oyster Bay.
8. Corinthian, fourth championship, Marblehead.
8. Moriches, novice race.
8. Beverly, fourth Corinthian, Monument Beach.
8. Royal Canadian, Canada cup race.
8. Shelter Island, Y. R. A. of L. I. Sound, annual.
9. Chicago, cruise, rendezvous at Charlevoix.
10. Boston, club, Marblehead.
10. Manchester, Crowhurst cup, open, W. Manchester.
- 10-16. Hempstead Bay, cruise.
11. Manchester, Y. R. A., open, W. Manchester.
12. Misery Island, Y. R. A., open, Salem Bay.
- 12-16. Atlantic, race week, Sea Gate.
13. East Gloucester, Y. R. A., open, Gloucester.
- 14-15. Annisquam, Y. R. A., open, Annisquam.
- 14-15. Southern, Southern Gulf Coast Y. A., New Orleans, La.
15. Beverly, fifth Corinthian, Monument Beach.
15. Penataquit Corinthian, special, Bay Shore.
15. South Boston, club, City Point.
15. Horseshoe Harbor, Y. R. A. of L. I. Sound, annual.
15. Moriches, special.
15. Huntington, Y. R. A. of L. I. Sound, annual.
15. Seawanhaka Corinthian, club, Oyster Bay.
15. Eastern, Marblehead to Gloucester.
15. Corinthian, fourth championship, Marblehead.
15. Royal Canadian, club, Toronto.
15. Chicago, special, Lake Michigan.
15. Savil Hill, club, Dorchester Bay.
15. Hartford, Y. R. A. of L. I. Sound, special.
16. Williamsburg, ladies' day.
17. American, Y. R. A., open, Newburyport.
17. New York, autumn cups, Glen Cove.
19. Moriches, ladies' regatta.
- 20-22. Duxbury, Y. R. A., open, Duxbury.
20. First America's cup race; balance of races to be sailed on alternate days, Sundays excepted, until result is determined.
22. South Boston, club, City Point.
22. Southern, Rawlins, Tranchina and Oliviri cups, New Orleans.
22. Corinthian, fifth championship, Marblehead.
22. Royal Canadian, club, Toronto.
22. Chicago, special, Lake Michigan.
- 24-25. Wellfleet, Y. R. A., open, Wellfleet.
26. Moriches, McAlenan cup race.
- 27-29. Columbia, Lipton competitive cup races, Chicago, Lake Michigan.
- 27-29. Cape Cod, Y. R. A., open, Provincetown.
29. Seawanhaka Corinthian, club, Oyster Bay.
29. South Boston, club, City Point.
29. Chicago, special, Lake Michigan.
29. Beverly, sixth Corinthian, Monument Beach.
29. Royal Canadian, club, Toronto.
29. Corinthian, sixth championship, Marblehead.
29. Savil Hill, club, Dorchester Bay.
29. Huguenot, Y. R. A. of L. I. Sound, annual.

THE trials between the two Shamrocks have been going on with great regularity for the past week. The challenger continues to show her superiority over Shamrock I. On Thursday last the two boats were given a severe test over a twenty-mile course. The wind was strong from the southwest and both boats, with jib headers set, had all they could swing to. There was quite a jump of a sea on, and both boats were taking green water aboard up to the mast. The first leg of the course was a reach, the second a run, and the third a beat. On the first leg Shamrock III. drew away from Shamrock I., but on the second leg Shamrock I. picked up all she had lost. On the windward leg the challenger outclassed the older boat and was leaving her fast when Shamrock I.'s mainsail split. Topsails and staysails were taken in on both boats and they ran back to the Lightship. On Saturday both the Shamrocks made visits to Erie Basin and the challenger had her big steel mast re-stepped. This was done in order to balance the new and larger mainsail that the boat is now carrying. The practice spins began again on Monday of this week and will continue until the final races take place.

THE result of the races at Montreal between the Royal St. Lawrence Y. C. and the Manchester Y. C. was not a surprise to anyone, although it was generally thought that the Massachusetts boat would make a better showing. The races for the Seawanhaka Cup have developed into a perfect farce, and they only serve to show each year how far in advance the Canadians are in the designing of this type of boat over the Americans and Englishmen. Mr. Duggan and his associates have gotten the designing and handling of these boats down to a science and are in a class by themselves. The cup could not remain in better hands, for the Can-

adians have proven themselves clean sportsmen from start to finish, and all the men who have gone to Montreal in search of the cup say that it is a great satisfaction (as long as they have got to be licked), to be beaten by such representative yachtsmen.

THE White Bear Y. C. have challenged for the cup, and it will no doubt be accepted, for the Royal St. Lawrence men have a warm spot in their hearts for the men from White Bear.

Manhasset Bay Y. C.

PORT WASHINGTON, LONG ISLAND SOUND, Saturday, August 1.

The fourth annual regatta of the Manhasset Bay Y. C. was sailed on Saturday, August 1. There were thirty-nine starters, and all but seven of the boats finished.

The course was W. N. W. from a line off Execution Light, $3\frac{3}{8}$ miles to Red Springs Point, N. by W. $3\frac{3}{4}$ miles to Parsonage Point, and S. W. $3\frac{3}{8}$ miles to the finish, a total distance of $10\frac{3}{4}$ miles. The wind at the start was S. E., making the first leg a beat, and the second a spinnaker run. A shift of wind made the last leg a beat back to the finish line. The boats in the two larger classes were to have covered the course twice, but owing to the lightness of the breeze their times were taken at the end of the first round.

Mr. Edward, Mr. MacLellan and the other members of the Regatta Committee were on board Commodore A. H. Alker's steam yacht Florence.

Anoatok and Leda were the first boats to start, and the former boat had no trouble getting away with Leda, and gave her a decided beating. Anoatok won the cup offered by Commodore Alker for the yacht in the 30ft. class or about it making the best corrected time over the course.

In the 30ft. class Vivian II. distinguished herself by beating Alert, which boat successfully defended the Manhasset Bay challenge cup.

The second boat to finish was the racabout Jolly Tar. This boat sailed a surprisingly good race, but only defeated Hobo by a comparatively small margin.

Houri won in the Larchmont one-design class, beating Adelaide badly; Dorothy did not finish.

Firefly took the honors in the 25ft. class, and Snapper was second.

In the 21ft. class Montauk finished first, but Trouble gets the race on corrected time.

Plover was the only boat to finish in the Manhasset sloop class.

Arizona finished alone in the Manhasset Bay one-design class; Falcon, her competitor, having withdrawn.

In the New Rochelle one-design class, Deuce beat Knave and Ace.

Skidoo was the only boat to finish in her class. Gosling won in the Hempstead Bay one-design class.

The results of the race are anything but conclusive in many instances, for it was little more than a drifting match. The summary:

Sloops—36ft. Class—Course 10¼ Miles—Start, 12:45.			
	Finish.	Elapsed.	
Anoatok, W. G. Brokaw.....	5 47 52	5 02 52	
Leda, S. H. Mason.....	6 05 32	5 20 32	
Sloops—30ft. Class—Course, 10¼ Miles—Start, 12:50.			
Alert, J. W. Alker.....	6 16 29	5 26 29	
Vivian II., E. D. Vernon.....	6 09 40	5 19 40	
Raceabouts—Course 10¼ Miles—Start, 12:55.			
Mavis, G. L. Pirie.....	6 18 05	5 23 05	
Maryola, C. W. Allen.....	6 01 51	5 06 51	
Jolly Tar, S. Howland.....	5 57 29	5 02 29	
Rascal, S. C. Hopkins.....	6 05 11	5 10 11	
Sis, I. T. Bedford, Jr.....	6 17 05	5 22 05	
Grasshopper, H. C. Pryer.....	6 31 09	5 36 09	
Hobo, T. L. Park.....	5 58 07	5 03 07	
Larchmont One Design 21-footers—Course, 10¼ Miles—Start, 1:00.			
Adelaide, J. J. Dwyer.....	7 17 11	6 17 11	
Houri, J. H. Esser.....	6 57 24	5 57 24	
Dorothy, L. G. Spence.....	Did not finish.		
Sloops—25ft. Class—Course 10¼ Miles—Start, 1:05.			
Chingachgook, E. A. Stevens.....	6 49 24	5 44 24	
Firefly, G. B. Granbery.....	6 31 00	5 26 00	
Snapper, F. Page.....	6 38 53	5 33 53	
Lucille, A. E. Black.....	7 10 09	6 05 09	
Sloops—21ft. Class—Course, 10¼ Miles—Start, 1:05.			
Jeebi, A. D. R. Brown.....	7 39 22	6 34 22	
Gazabo, H. P. Vulte.....	7 37 25	6 32 25	
Trouble, W. H. Childs.....	7 16 59	6 11 59	
Montauk, G. R. Sheldon.....	7 12 19	6 07 19	
Manhasset Sloop Class—Course, 10¼ Miles—Start, 1:05.			
Pagan, R. W. Jackson.....	Did not finish.		
Peg, A. Roester, Jr.....	Did not finish.		
Plover, H. Place.....	7 23 50	6 18 50	
Manhasset Bay One-Design Class—Course 10¼ Miles—Start, 1:10.			
Arizona, G. A. Corry.....	7 46 16	6 36 16	
Falcon, Cole & Stevens.....	Did not finish.		
New Rochelle One-Design Class—Course, 10¼ Miles—Start, 1:10.			
Knave, Wm. Bavier.....	7 31 07	6 21 07	
Deuce, N. D. Lawton.....	7 22 40	6 12 40	
Ace, A. Bavier.....	7 28 07	6 18 07	
Pelham Bay Larks—Course, 10¼ Miles—Start, 1:20.			
Yellow Jacket, G. B. Robinson, Jr.....	Did not finish.		
Flirt, D. Carll.....	Did not finish.		
Skidoo, M. S. G. Davies.....	7 51 33	6 31 33	
Gloria, G. B. Mott.....	Did not finish.		
Hempstead Bay One-Design Class—Course, 10¼ Miles—Start, 1:20.			
Why Not, W. Burdock.....	7 46 56	6 26 56	
Gosling, T. Pratt.....	7 37 07	6 17 07	
Wif Waf, H. E. Sayre.....	7 41 35	6 21 35	
Scud, G. B. Abbott.....	7 44 13	6 24 13	
Flicker, C. Handy.....	7 46 20	6 26 20	

The winners were: Anoatok, Vivian II., Jolly Tar, Houri, Firefly, Trouble, Plover, Arizona, Deuce, Skidoo and Gosling.

Indian Harbor Y. C.

INDIAN HARBOR, LONG ISLAND SOUND, Saturday, July 25.

The Indian Harbor Y. C. held a handicap race on Saturday, July 25. In the club handicap class, Sirene beat Maryola, and Stingy won in the sailabout class. The summary:

Club Handicap.		
	Start.	Finish.
Sirene, Doremus & Outwater.....	3 05 00	5 27 48
Beruna, H. S. Osborne.....	3 08 00	5 38 32
Eos, E. P. Mead.....	3 15 00	5 40 15
Robert Hood, C. E. Gartland.....	3 25 00	5 31 10
Maryola, C. W. Allen.....	3 28 00	5 30 13
Sailabouts.		
Betty, Hyde.....	3 30 00	5 06 05
Stingy, E. Zittell.....	3 30 00	5 05 08
Queeny, Commodore Tilford.....	3 30 00	5 09 37
Cero, R. Mallory, Jr.....	3 30 00	5 11 53

The Canada's Cup Defender.

TORONTO, July 30.—The first of the series of races for a cup in connection with the tuning up of the Canada's cup defender was not highly successful, in spite of a good showing of contestants. Strathcona participates in the trials, but is not eligible for the cup. It is reserved for the boat which makes the best average showing compared with hers. The object is to induce members of the Royal Canadian Y. C. to race the larger yachts and give the cup defender plenty of training.

The fleet that raced on Friday consisted of Strathcona, sailed by Commodore Jarvis; Merrythought, sailed by J. Wilton Morse; Yama, sailed by Mr. Pearson; Canada, sailed by C. A. B. Brown; Clorita, schooner, sailed by Geo. H. Gooderham, Jr., and Beaver, jib and mainsail sloop, sailed by Dr. A. H. Garrett. The first name contestants are cutters. Beaver was the cup defender in 1899.

The fleet got over the line in a bunch and started for the sail around the island in a light southwesterly breeze. Steering out the Western Gap, Strathcona's performance in the faint air was marvellous. Starting third, she edged ahead, and was in the lead before she had gone half a mile. And she was never caught. Even Merrythought, fresh from the dry dock, and with a cloud of canvas, could not hold her on any point. Out in the lake the wind was light, baffling and fickle, often fair at the masthead and dead ahead on deck. Florita and Beaver towed in before completing half the course. Strathcona and Yama towed in one hour later, when near the Eastern Gap. But Merrythought and Canada fought it out grimly, although it took half the night to do it. The course around the island is announced to be seven and three-quarters nautical miles. Merrythought took six hours and a half to cover it and Canada eight. As the course is often sailed in an hour or less, the weight of the breeze may easily be discerned. Strathcona led Merrythought by a quarter of a mile and the others by half a mile or more when she accepted a tow.

Somewhat to the disappointment of the yachtsmen who went supperless to finish the race, the first contest was ruled out because it was not completed by sundown, and Tuesday, July 28, was fixed for the next race.

Meantime, Strathcona and Merrythought had two more races on Saturday, July 25. There was a fairly fresh west wind blowing when they started on the first one, taking the leeward channel. Strathcona just had room to squeeze in between the buoy and Merrythought's weather quarter, and the two raced to the Eastern Gap side by side. Going out the piers, Strathcona led, and in the beat along the island shore she worked out a lead of nearly a quarter of a mile. She sped over the line with a comfortable margin, but not as much as she had had in the lake. The wind had decreased to half its strength, and Merrythought, after sailing nearly the whole course under a working topsail, swung a clubtopsail near the finish. Strathcona carried her clubtopsail throughout. The time of the first race was:

	Start.	Finish.
Strathcona	2 48 30	3 55 07
Merrythought	2 48 30	3 56 52

After ten minutes' wait the yachts started on a second race, crossing the line as one boat, with Strathcona again to windward. The breeze again piped up, rising steadily to twelve miles an hour again, and it was the same old story. Strathcona held Merrythought to the Gap, then passed her and ran away from her in the beat to windward. Entering the Western Gap she had over half a mile of a lead, and despite the fact that she made what appeared to be merely a practice gybe on the run down and then gybed back again, she fully held her own from the Western Gap to the finish. As soon as she crossed the line she set her spinnaker, doing it very smartly, and stood on down the bay for practice in sail handling before going to her moorings. The time in the second race was:

	Start.	Finish.
Strathcona	5 17 00	5 17 35
Merrythought	4 05 00	5 22 34

On Monday Strathcona went on the drydock. As already noted, her bottom needs all the polishing possible. She received a coat of tar preparation below the water line, and her aluminum wash-streak disappeared under a broad belt of black enamel, coming up four inches beyond the upper edge of the aluminum paint. Her sheer ribbon was painted black and on either bow was painted a maple leaf wreath and the crest of the Royal Canadian Yacht Club, in full heraldic colors. The defender's underbody shone like patent leather as she stood on the ways, and when she floated again she looked twice as racy. Her high freeboard and white topsides had made her look bulky.

The race for the special cup on Tuesday was sailed in a good east breeze that had raised a big sea in the lake. Strathcona led over the line, with the rest of the fleet close on her heels, and stood up the bay with her mainsail to port. The others carried theirs to starboard. Spinnaker carrying is against the rules in the harbor. Strathcona went out of her way a trifle, and had to gybe over at the Western Gap. She was third going out, but rapidly blanketed Canada and shot after Merrythought, the leader. The schooner Clorita, tearing along like a steamboat under the influence of an enormous jibtopsail, worked up into third place, passing both Canada and Yama. When the sheets were flattened down for the beat down the island shore Strathcona shot ahead and overhauled Merrythought on the second tack. From that on she was the leader. Nor was it only in the windward work that she showed her superiority. In the broad reach from the Eastern Gap to the finish at the Royal Canadian Yacht Club she gained a little. Timed when entering the piers she was one minute and five seconds ahead of Merrythought. At the finish she was leading by one minute and eleven seconds. Her performance was the more creditable because she sailed under a wretched working topsail, with a horizontal leach, while the others swung clubtopsails. The time was:

	Start.	Finish.	Corrected.
Strathcona	4 16 00	5 16 40	1 00 40
Merrythought	4 16 07	5 17 51	1 01 51
Canada	4 16 13	5 19 35	1 01 29
Yama	4 16 45	5 23 04	1 04 58
Clorita	4 17 00	5 18 38	1 01 43
Beaver	4 17 25	5 24 22	1 06 16

Merrythought is the scratch boat in these races. She allows Clorita 55.18 seconds and Canada and Yama 2 minutes and 6.17 seconds. Beaver's time allowance was not worked out for this race, but she was put on the same footing as Canada and Yama. Clorita allows Canada and Yama 1 minute and 10.99 seconds. Revised time gives Canada first place, Clorita second and Merrythought third.

In the race on Wednesday, July 29, Strathcona led the fleet by very nearly a mile, although spinnaker carrying in part accounted for it. In order to get his crew perfect, Skipper Jarvis set his big sail three times, and although he did not allow it to draw for more than a minute at once, it pulled the boat along. This, however, scarcely more than compensated for the fact that he went very much out of his way to carry the sail.

The fleet was out again with the exception of little Beaver, and the five crossed the line within fifteen seconds of gunfire. Strathcona steered a course at least three points different from the others in order to practice spinnaker setting, and had to gybe over and make two broad reaches, or a run and a reach, of what was a run with the wind dead astern. Nevertheless, she led out of the Eastern Gap. After that there was no holding her, and she romped away from the others at the rate of a minute every mile. Merrythought also worked out a lead that kept her time allowance safe, but she was well astern of the cup defender. The time was:

	Finish.	Corrected.
Strathcona	5 24 12	1 09 12
Merrythought	5 31 10	1 16 10
Clorita	5 34 15	1 18 20
Yama	5 38 02	1 20 56
Canada	5 39 15	1 22 09

Mr. George Ratsey, of New York, a nephew of the famous Thomas Ratsey, the English sailmaker, whose firm supplied Strathcona's canvas, sailed in the cup defender in this race.

CHAS. H. SNIDER.

Seawanhaka Cup.

This trophy has been held for so many seasons by the Royal St. Lawrence Y. C. that its defense has become a regular annual event. In many ways one year is very much like another, the same class of boats being used, and the whole defense fleet looking very much alike to an ordinary observer. While one or two new boats are built each year, the general type has been preserved, and while there is a sentiment in favor of picking a new boat for the work, it is well known that there are several available, even two or three years old, which would at least make a creditable showing.

On the other side each season shows a new challenging club, a new crew, and an unknown boat. The scow type of the small western lakes has been a favorite with challengers, but this year the chosen boat, Kolutoo, is closer to the normal Duggan type than to any other. There is nothing freakish about her except the scoop-shaped counter, a weight saving feature which does away with the usual transom and at the same time gives a strong form. Of course it looks like a standing invitation for a following sea to come aboard, but this is a trifle, and one cannot help thinking what a convenient arrangement it would be on a larger craft for hauling the dinghy on deck.

Kolutoo has already been fully described in FOREST AND STREAM, but for purposes of comparison it may be noted that she is rather less powerful than the general run of Duggan boats, and is admittedly at her best in light to moderate weather. She carries a single centerboard and the hull is covered with canvas well black leaded, which gives a good surface.

The defender, Thorella II., the property of Mr. W. C. Finley, is another step in the development of the Duggan type, but her design is this year wholly from the hands of Mr. F. P. Shearwood, for many years the lieutenant of Mr. Duggan, and now his successor. The boat is really an improved Trident, carrying two bilgeboards and no centerboard, and two rudders, one through each quarter, controlled by a single tiller. These rudders look absurdly small, but owing to the effective position of the lee one when the boat is heeled, they appear to be sufficient. Similarly each of the two bilgeboards has but forty per cent. of the area of such a centerboard as would be necessary, and yet, in the matter of holding on, Thorella is conspicuously successful.

On Wednesday, July 29, the judges began the work of measuring, the official figures being as follows:

	Kolutoo.	Thorella.
Gaff	14ft. 6 in.	13ft. 7½ in.
Boom	25ft. 3½ in.	24ft. 3 in.
Hoist	14ft. 5 in.	16ft. 7½ in.
Leach	31ft. 1 in.	32ft. 4½ in.
Area mainsail	381sq. ft.	397sq. ft.
Area fore triangle	111sq. ft.	100sq. ft.
Total	492sq. ft.	497sq. ft.

Both boats are designed to carry the limit of 500 square feet of working sail. They also fit the 25ft. class under the length and sail area rule. Spinnakers are allowed not exceeding twice the area of the fore triangle.

The crew of the challenger consisted of R. D. Boardman, helmsman; F. Henry Higginson, owner; Frank Burgess and J. S. Lovering; total weight, 650 pounds, this being the limit allowed. They were originally over and for a week restricted themselves to Lenten fare, with plenty of exercise. The crew of the defender was lighter, weighing only 629 pounds, and included Chas. Routh, helmsman; W. C. Finley, owner; Angus McDonald and H. A. Gordon.

With the challenging party from the Manchester Y. C. were Messrs. Burgess and Packard, the designers of the boat. The judges were J. L. Brewer, selected by the Manchester Club, and W. Q. Phillips by the Royal St. Lawrence Club. Mr. Owain Martin, who filled the office with acceptance to all parties last year, again acted as third judge.

First Race, July 30.

The crew of Kolutoo won the toss and elected to sail

the first race over a triangular course. The morning was wretchedly wet, a continuation of a fortnight's unsettled weather, but by noon it began to clear, and at two o'clock the weather was perfect, the wind being down the lake moderate to fresh, with occasional gusts, but not squally. All buoys to starboard gave a beat to windward to the first mark, then a couple of broad reaches home. Kolutoo carried a single reef, but Thorella lugged full sail without difficulty. A start was made at 1:55 P. M., the boats doing some pretty jockeying, hanging on the line for a few seconds before the starting signal, and then going over together without any loss of time, both on starboard tack, Kolutoo having the weather berth. This ought to have made a fine race to the first mark, but to the surprise of even her warmest admirers, Thorella sailed through the lee of her opponent, both quickly and cleanly, and in a few minutes had established such a decisive lead that spectators could hardly believe their eyes. It was simply a matter of footing and holding on, the first being accounted for by the carrying of full canvas while Kolutoo was reefed. The race having thus become a procession, the following times of the first round are interesting:

	1st mark.	2d mark.	3d mark.
Thorella	2 16 09	2 24 26	2 31 00
Kolutoo	2 20 31	2 28 30	2 35 31

It will be seen that after losing heavily on the windward work, Kolutoo gained a trifle on the second leg, but lost again on the third. The elapsed times for the runs are worth noticing. Each leg was 1-3 nautical miles, giving a speed of about 10 knots for both boats. From official reports the wind varied from 15 to 20 land miles per hour, but this reading was from an anemometer on top of a lighthouse on the lake below the course. On the surface of the water it was probably less.

The second round again showed a gain for Thorella on the windward work, the following times being taken:

	1st mark.	2d mark.	3d mark.
Thorella	2 52 00	2 59 32	3 06 45
Kolutoo	3 02 12	3 10 30	3 17 45

This ended the work of Kolutoo for the day, her rudder breaking and she withdrew. Thorella finished alone at 3:44:20.

Second Race, July 31.

This was sailed to windward and return over a two-mile course, three rounds making 12 miles. The weather was by no means settled. There had been a strong wind down the lake all night, raising considerable sea, and it held throughout the day, blowing 20 miles an hour at times. A start was made at 2 P. M., Thorella turning in one reef and Kolutoo two, and it may as well be said at once that their relative performances were about in proportion to the canvas carried. Mr. Starling Burgess, the designer, sailed on Kolutoo in place of his cousin, Frank Burgess, and, in common with the crew, did some daring and persistent hiking—all to no purpose. The boat simply refused to stand up, and there is no disguising the fact that she is seriously deficient in stability in anything more than light to moderate breezes. She lost steadily, and the following times tell the whole story:

	1st round.	2d round.	Finish.
Thorella	2 38 35	3 15 10	3 50 17
Kolutoo	2 43 48	3 28 00	4 03 53

Third Race, Aug. 1.

The morning was clear and fair, with a light wind and smooth water. Everyone hoped it would last, in order that a race might take place under more favorable conditions for Kolutoo. It freshened, however, coming out of the northwest, so the boats were sent away at 2:10, all buoys to port, giving windward work on the first leg of the triangular course. A close and pretty start was made, and then the usual thing happened. Thorella, with one reef tied down, simply sailed away from Kolutoo with two reefs, and all hope of a close race vanished. The wind lightened a little, both boats soon showing whole mainsails, but even then there was no catching Thorella on the windward work, and before the race was half over a mile of water separated the boats, so that all semblance of racing vanished. The times were as follows, start 2:10:

	1st round.	2d round.	Finish.
Thorella	2 49 30	3 27 15	4 06 30
Kolutoo	2 55 55	3 38 12	4 18 55

It is pleasant to be able to say, in conclusion, that the Kolutoo men were all that could be desired, both as yachtsmen and gentlemen—clever sailors, Corinthians above suspicion, and able to take a defeat smilingly. It is a great pity that their energies were wasted on so unsuitable a boat. Nothing but an all-round boat is worth bringing to Lake St. Louis, where 15 or 20 mile breezes are as likely to occur as anything lighter. Of course, three days of such weather may be set down as unusual, but it is safe to figure on a fair proportion in any series of races. It may be pointed out that with sail limited to 500 square feet on an allowable water-line of over 27 feet, there is no difficulty in producing a stiff boat, and yet for several years every challenger has been under rather than over in the matter of stability. What is wanted is a craft that heels easily down to her deck, but that will stick there and carry her sail effectively in a 15-mile breeze.

It is only fair to say that Thorella II. is no commonplace boat, but a remarkable performer to windward and a credit to Mr. Shearwood, her designer. This modest young man has for years shared the work and anxiety with Mr. Duggan, and it is especially gratifying that this, his first venture alone, has proved so successful. Mr. Duggan is now permanently located at Sydney, C. B., and quite out of the racing on Lake St. Louis. He was not present during these cup races, but advantage was taken of his visiting Montreal a few days before to present both him and Mr. Shearwood with silver tea services, suitably inscribed.

WILLIAM Q. PHILLIPS.

Mr. Stanley M. Seaman has made the following transfers through his agency: The steam yacht Reposo, sold by the Herreshoff Mfg. Co. to Mrs. Robert C. Black, Pelham Manor, N. Y.; the auxiliary yawl Kathleen, sold by Mr. J. K. Hutchins, New Rochelle, N. Y., to Mr. J. J. Kenny, Toronto, Canada; the Knockabout Scooter, sold by Mr. Laurence H. Wilbur, Philadelphia, Pa., to Mr. A. D. O'Neil, New York City; the schooner yacht Rosina has been chartered to Mr. A. P. Wetherill, Philadelphia, Pa.

Newport Trial Races.

NEWPORT, R. I.,
Monday, July 27.

It was originally intended that the trial races should be sailed on alternate days from July 30 to August 8, and five races were on the programme. Last week the owners of the gos and the regatta committee modified this, and three races were to be sailed this week, and the Newport series in which the gos were also to start were to have been sandwiched in between the trials. The Newport series fell through because there were no yachts here to race, and this morning before the yachts left the harbor it was announced that the trials were to be sailed on consecutive days and to be over as soon as possible. After the yachts got back to their moorings a meeting of the Committee on Cup Challenge was held on board Rambler. There were present: Commodore Frederick G. Bourne, ex-Commodore Lewis Cass Ledyard, Secretary George Cormack, Fleet Captain C. L. F. Robinson, Mr. J. Malcolm Forbes, Mr. Iselin, Mr. Belmont, and Mr. Morgan, representing the Reliance, Constitution, and Columbia respectively, were there, as well as the Regatta Committee, ex-Commodore S. Nicholson Kane, Mr. Newbury D. Lawton, and Mr. Edward H. Wales. It was agreed by all that the Reliance had made a consistent showing since she began racing, and was much the best boat of the trio. Further trials were not thought necessary, and she was selected to defend the Cup against the Shamrock III., and the Constitution was selected as the reserve boat.

The race earlier in the day was one of the best of the season. The Regatta Committee were on board the steam yacht Kanawha, which Mr. H. H. Rogers had placed at their disposal.

The yachts were rather late in getting out to the Lightship, and it was necessary to postpone the start. A brisk northwester had been blowing all night, but it was much lighter when the yachts went out, but anticipating a fresh breeze only small club topsail were set. The course was signaled as soon as the yachts were near enough to the committee boat. It was fifteen miles to leeward and return, and the first leg was S. S. E., the wind being N. N. W., and blowing about ten miles an hour. It was puffy and some of the puffs were quite strong, causing the yachts to heel so that much of their underbodies were thrown up to the wind. The tug Storm King logged the course. The preparatory signal was made at 11:15, and ten minutes later the warning sounded. The yachts were then sending up balloon jibtopsails in stops. Reliance and Constitution were then on the port tack heading towards the northeast, and the Columbia, with the wind on the starboard beam, reached towards Reliance, and, passing astern of that yacht, held further in towards the shore before she wore round and went for the line. Reliance had held well over towards the eastern end of the line, and when the starting gun sounded she eased off her boom to starboard and set her spinnaker to port. Constitution stood for the outer end of the line, and just before she crossed she gybed her boom to port and broke out her balloon jib topsail. Columbia was handicapped about 15 seconds at the line, but she crossed with her boom to port and spinnaker set to starboard. Captain Barr had made a bad error. The wind was backing to the west, and Constitution and Columbia were able to keep their balloons drawing, and they at once drew away from Reliance. Constitution waited a few minutes before she broke out her spinnaker. The times of crossing the line were: Reliance, 11:30:26; Constitution, 11:30:31; Columbia, 11:32:00. At 11:37:00 Reliance's spinnaker was taken in and her boom gybed to port. She then hauled on the wind and reached across the sterns of Columbia and Constitution, and then the spinnaker was set again flying. She at once overhauled Columbia and passed that yacht at 11:50:00 and slowly picked up Constitution. At noon Constitution was leading by about 300 yards. Her spinnaker was guyed well forward and the sheet was flowed so that it spilled into the balloon and kept that sail drawing well. Columbia's spinnaker sheet was trimmed in flat and the balloon was constantly falling limp without any wind in the sail at all. At 12:11:30 Reliance's spinnaker was taken in and one of lighter material set. It took two minutes to make the change. Constitution followed the example of Reliance at once. Reliance was slowly picking up what she had lost at the start, and at 12:30 she began to go by Constitution to windward. It took her just 15 minutes to pull clear and then Constitution drew up again, and the two yachts sailed for several minutes on even terms. Before reaching the turning mark, however, Reliance pulled clear again. Balloons were taken in and baby jib topsails set in their place, and spinnakers were carried right up to the mark and taken in while the main sheet was being trimmed in for the windward work. Reliance turned the mark at 1:10:06, Constitution at 1:10:31, and Columbia at 1:14:48. The times over the first leg of the course and the gains are shown in the following:

	Start.	Turn.	Elapsed.
Reliance	11 30 26	1 10 06	1 36 40
Constitution	11 30 31	1 10 31	1 40 00
Columbia	11 32 00	1 14 48	1 42 48

On the fifteen miles' run Reliance had beaten Constitution 20 sec. and Columbia 3 min. 8 sec.

Reliance and Constitution held on the starboard tack after turning the mark, and Constitution, having made a closer turn, was a little to windward of Reliance's wake; but the new yacht at once began to foot fast and draw ahead. Columbia took the port tack as soon as she turned, heading towards the east. Baby jib topsails were carried on each yacht. Constitution began to forereach on Constitution, and at 1:21:00 Constitution took the port tack and Reliance followed her a few seconds later. Columbia took the starboard tack as the other two yachts went about, and two minutes later she took the port tack again and held on that tack for 26 minutes. Reliance and Constitution were having a fine fight. Reliance pointed high, and Captain Rhodes would then romp the Constitution off, and she would foot fast, and when clear of Reliance she would nip up again, until Captain Barr bore down on her to kill her again. At 2:06:20 Constitution took the starboard tack and Reliance followed her thirty seconds

later. Up to this Constitution was well within her time, but then they struck a freshening breeze which continued to grow stronger as they got nearer to the land. They were heeled so that their rails were down to the water. This tack was only a short one, and at 2:11:00 both went on the port tack, and ten minutes later baby jib topsails were taken in. All were then heading towards West Island, and at 2:49:30 Columbia took the starboard tack for the finishing line. She had lowered her baby jib topsail just before she tacked. Reliance tacked for the line at 2:50:10 and Constitution at 2:51:20. Reliance just managed to fetch. At the end, when it looked as if she must tack to weather the Kanawha, a fresher puff laid her well over, and Captain Barr luffed her sharply and she just squeezed across. Constitution had to make a short hitch to fetch and the Columbia was able to make the line easily. Reliance finished at 3:04:00, Constitution at 3:09:16, and Columbia at 3:10:11. Columbia had made quite a gain through keeping to the eastward. She had found the fresher breeze much earlier than the other two. The times over the last leg of the course are shown in the following:

	Turn.	Finish.	Elapsed.
Reliance	1 10 06	3 04 00	1 54 03
Constitution	1 10 31	3 09 16	1 58 45
Columbia	1 14 48	3 10 11	1 55 23

On the fifteen miles to windward Reliance had beaten the Columbia 1m. 23s. and Constitution 4m. 42s.

The summary of the race:

	Start.	Finish.	Elapsed.
Reliance	11 30 26	3 04 09	3 33 43
Constitution	11 30 31	3 09 16	3 38 45
Columbia	11 32 00	3 10 11	3 38 11

Reliance had beaten Columbia 4 min. 20 sec. and Constitution 5 min. 2 sec.

Reliance will be tried with the Constitution as often as Mr. Iselin wants, and some of the sails of the Constitution will be tried on the new yacht. She went out for two short spins on Tuesday, and later on went to Bristol. Mr. George Cormack will be in charge of Constitution during the tuning up trials.

Atlantic Y. C.

SEA GATE, LONG ISLAND,
Saturday, August 1.

The Atlantic Y. C. held races for classes M and under on the afternoon of Saturday, August 1. Ten boats started in the event and all finished. A good breeze, S. by E., held throughout the race.

Two newcomers appeared in class P. Naiad, the winner, is from the designs of Mr. Henry J. Gielow, and was recently launched from the Weber yard at New Rochelle. Smoke was the other stranger in the class.

The 30-footers, Bagheera and Bobtail, sailed a fine race. These boats went twice out to West Bank light and return, leaving the same on the starboard hand. It was close hauled work out and a reach home. The other boats sailed the regular inside course. They had a run to Fort Hamilton mark, windward work to the club buoy off Ulmer Park, and several more short hitches to the start off Sea Gate.

Bagheera beat Bobtail 2m. 28s.; Naiad beat Cockatoo 2m., Smoke 5m. 48s.; Mary beat Wraith 1m. 50s, Eileen 11m. 18s.; Scalawag beat Constance 5m. 5s. The summary:

Sloops—Class M—Start, 3:10.			
	Finish.	Elapsed.	
Bagheera, Hendon Chubb.....	5 07 23	1 57 23	
Bobtail, E. F. Luckenbach.....	5 09 51	1 59 51	
Sloops—Class P—Start, 3:15.			
	Finish.	Elapsed.	
Naiad, J. B. Palmer.....	4 37 22	1 22 22	
Cockatoo, W. A. Barstow.....	4 39 22	1 24 22	
Smoke, L. H. Dyer.....	4 43 10	1 28 10	
Sloops—Class Q—Start, 3:20.			
	Finish.	Elapsed.	
Mary, M. Grundner.....	4 46 40	1 26 40	
Wraith, Calvin Tompkins.....	4 48 30	1 28 30	
Eileen, F. J. Havens.....	4 57 58	1 37 58	
Sloops—Class R—Start, 3:20.			
	Finish.	Elapsed.	
Scalawag, E. S. Ludlow.....	4 57 00	1 37 00	
Constance, F. J. Prentice.....	5 02 05	1 42 05	

The winners were: Bagheera, Naiad, Mary and Scalawag.

ATLANTIC Y. C. OCEAN RACE,
July 27 to 29—290 miles.

The third ocean race of the Atlantic Y. C. was started off Brenton's Reef, Newport, on the morning of Monday, July 27. Three schooners came to the line, and the event was won by Mr. Morton F. Plant's new Herreshoff creation, Ingomar, which did such good work on the cruise of the New York Y. C. Mr. Robert McCurdy's Lasca was second, and Commodore Robert E. Tod's flagship, Thistle, third. The winner gets a beautiful cup offered by the Atlantic Y. C. There is also a second prize.

There was a fresh breeze blowing N. N. W. when the three schooners came to the starting line. This gave them a run on the first part of their journey to Nantucket Shoal Lightship. From there the yachts sailed to the finish off Scotland Lightship, a distance of approximately 290 miles.

The starting signal was given at 10:15. Thistle crossed at 10:16:30, Ingomar at 10:17, and Lasca at 10:18:40. At 9 P. M. that day Thistle carried away her foretopmast. She was then twelve miles west of Nantucket Shoal Lightship.

The wind held steady from the N. W. throughout Monday, and the weather was fair. On Tuesday the breeze became variable, falling at times to a flat calm. Wednesday dawned cloudy with the breeze S. S. W. The summary:

	Start.	Finish.	Elapsed.
	July 27, A.M.	July 28, P.M.	
Ingomar, M. F. Plant.....	10 17 00	6 44 20	20 27 20
Lasca, R. P. McCurdy.....	10 18 40	9 32 30	23 13 50
	Start.	Finish.	Elapsed.
	July 29, A.M.		
Thistle, Robert E. Tod.....	10 16 30	9 23 35	35 07 05

The Cape May Y. C. has been incorporated under the laws of the State of New Jersey, and the following officers have been elected:

Commodore, J. W. Allison; vice-commodore, Christopher Gallagher; rear commodore, T. Clifford Wilson; secretary, Adam Suelke; treasurer, Harry Hazelhurst; fleet captain, Benton S. Dunn.

Brooklyn Y. C.

BENSONHURST, LONG ISLAND,
Saturday, August 1.

The fifth regatta of the Y. R. A. of G. B. was held on the afternoon of Saturday, August 1, under the auspices of the Brooklyn Y. C. Nineteen boats started and finished the contest.

It was by far the best day for racing seen on Gravesend Bay this year. An eight knot breeze, S. by E., held steady throughout. The boats were sent over the reverse courses, leaving all marks on the port hand. This afforded those in classes P and under plenty of hard windward work.

The first class was sent away at 3:18. The others followed at intervals of three minutes. The starts were good. Adeline (ex-Gwendolen) and Streak were sailing their first races of the year. Boats in classes M and N twice covered the outside course. They had a close reach to Craven Shoal buoy, close hauled work to Red Can buoy No. 2 off Coney Island Point, a short run to make by the point on the return journey, and a reach home to the start off the Brooklyn Y. C.

The other starters, covering the inside course, had a run to the Marine and Field Club mark, a reach to Fort Hamilton, windward work to the stake boat off Sea Gate, and a reach home.

The long windward leg from Fort Hamilton to Sea Gate stretched the boats out considerably, and craft which led at the end of the first round improved their positions until the end. Ogeemah was the first of the smaller fleet to finish. Adeline led the larger starters home by a good margin.

Bonito beat Kangaroo 10m. 39s.; Squaw beat Indian 16m. 29s.; Ogeemah beat Streak 4m. 43s., Karma 4m. 45s.; Sandpiper beat Apuka II. 7m. 32s., Trio 19m. 40s.; Rascal beat Martha M. 3m. 42s., Boozie 5m. 10s., Lelia B. 31m. 39s.; Esperance beat Kelpie 1m. 10s., Jig-a-Jig 4m. 46s. The summary:

Class M—Special—Start, 3:18.			
	Finish.	Elapsed.	
Bonito, Haviland Bros.....	5 28 35	2 10 35	
Kangaroo, C. H. Humphreys.....	5 39 14	2 21 14	
Sloops—Class N—Start, 3:18.			
	Finish.	Elapsed.

Boozie, C. D. Durkee.....	5 22 10	1 49 10	
Lelia B., J. B. Barnes.....	5 48 42	2 15 42	
Marine and Field Class—Start, 3:36.			
	Finish.	Elapsed.	
Esperance, T. A. Hamilton.....	5 26 30	1 50 30	
Kelpie, W. K. Brown.....	5 27 40	1 51 40	
Jig-a-Jig, Hutcheson & Ferguson.....	5 31 16	1 55 16	

The winners were: Bonito, Squaw, Ogeemah, Sandpiper, Rascal, Esperance; Adeline and Spots took sail overs.

Raritan Y. C.

PERTH AMBOY, RARITAN BAY,
Saturday, August 1.

There were nineteen starters in the power boat race held by the Raritan Y. C. on Saturday, August 1. The boats were divided into two classes and all covered a three and two-thirds mile triangle three times, making a total distance of eleven miles. It was a handicap match, and the boats were started separately in accordance with the amount of time they had to allow.

Betsy, a class A boat, broke down before the start, and was handicapped some fifteen minutes. Irene was the only boat to finish in class A. Freak won in class B, and Wink was second. The summary:

Launches—Class A.			
	Start.	Finish.	Elapsed.
Irene, B. Mitchell.....	4 12 18	5 29 45	1 17 27
Betsy, Leo Straub.....	4 13 56	Did not finish.	
Albatross, A. Guyges.....	4 21 41	Did not finish.	
Launches—Class B.			
	Start.	Finish.	Elapsed.
Freak, W. Greene.....	3 14 18	5 05 18	1 51 00
Wink, C. B. Ballard.....	3 26 00	5 12 58	1 46 58
No. 4, C. Fries.....	3 12 45	5 13 45	2 01 00
No. 5, W. B. Pratt.....	3 25 45	5 17 15	1 51 30

Albatross.....	Disabled.		

Bridgeport Y. C.

BLACK ROCK, LONG ISLAND SOUND,
Saturday, July 25.

The annual regatta of the Bridgeport Y. C. was held on Saturday, July 25. The race was sailed in a fresh S. W. breeze, and the boats covered a thirteen-mile course.

Massasoit, Nutmeg and Tecumseh, three boats built to challenge for the Seawanhaka cup last year, met in one of the classes. Massasoit beat Tecumseh over 12m., and Nutmeg was out of the running from the start.

Firefly won in the 25ft. class, and Dora won in the 15ft. class. Diana was the only starter in the 30ft. class, and took a sail over. The summary:

Seawanhaka Cup Class.			
	Start.	Finish.	Elapsed.
Massasoit, T. H. MacDonald.....	2 25 07	4 46 34	2 21 27
Tecumseh, H. Fish.....	2 25 20	4 59 01	2 33 41

Monsoon, T. Fish.....	2 26 53	4 21 22	2 00 29

Bar Harbor Yachting.

BAR HARBOR, MAINE,
Friday, July 17.

A match race was sailed between Bat, one of the new Bar Harbor boats turned out this year by Herreshoff, and Paraxilla, one of the Buzzard's Bay one-design boats, on Friday, July 17. The boats sailed twice over a triangular course. Bat was first over the starting line and was never headed.

Saturday, July 18.

The Bar Harbor boats sailed a race over a twelve-mile course in a moderate breeze on Saturday, July 18. Bat again won, beating Papoose III. handily. The summary, start 2:30:

	Elapsed.
Bat, Edgar Scott.....	1 57 58
Papoose III., V. E. Macy.....	1 59 07
Joker, H. M. Sears.....	1 59 17
Curlew, R. H. Gallatin.....	2 00 32
Zara, J. M. Sears, Jr.....	2 01 18
Scud, A. J. Cassatt.....	2 01 21
Kawana, J. B. Trevor.....	2 03 33
Astrild, H. L. Eno.....	2 03 33
Cricket, Walter Ladd.....	2 08 35
Redwing, T. G. Condon.....	2 08 50

Friday, July 24.

The Bar Harbor 31-footers sailed a close race over courses in the inner bay on Friday, July 24. The four leading boats finished within 36 seconds of one another. Papoose III. won by 5 seconds and Cricket was second. The summary, start 10:35:

	Elapsed.
Papoose III., V. E. Macy.....	1 48 20
Cricket, W. G. Ladd.....	1 48 25
Curlew, R. H. Gallatin.....	1 48 35
Bat, Edgar Scott.....	1 48 56
Joker, H. M. Sears.....	1 50 15
Kawana, J. B. Trevor.....	1 52 27
Ben, A. Y. & P. C. Stewart.....	1 53 52
Astrild, H. L. Eno.....	1 54 14
Scud, A. J. Cassatt.....	1 55 50
Zara, J. M. Sears, Jr.....	1 57 03
Redwing, T. G. Condon.....	2 04 53

Saturday, July 25.

In the race sailed by the 31-footers on Saturday, July 25, Scud won, beating Curlew by 10 seconds. Bat was third. The boats covered a twelve-mile course. The summary, start 2:40:

	Elapsed.
Scud, A. J. Cassatt.....	1 59 23
Curlew, R. H. Gallatin.....	1 59 33
Bat, Edgar Scott.....	2 01 03
Kawana, J. B. Trevor.....	2 01 23
Cricket, W. G. Ladd.....	2 01 25
Zara, J. M. Sears, Jr.....	2 01 36
Papoose III., V. E. Macy.....	2 02 23
Ben, A. Y. & P. C. Stewart.....	2 03 06
Joker, H. M. Sears.....	2 03 25
Redwing, T. G. Condon.....	2 04 05
Indian, W. C. Allison.....	2 07 51

Saturday, August 1.

A protest leaves the result of the race sailed by the Bar Harbor boats on Saturday, August 1, in doubt. Cricket was the first boat to finish. The summary, start 2:35:

	Elapsed.
Cricket, W. G. Ladd.....	1 36 03
Indian, W. C. Allison.....	1 36 24
Curlew, R. H. Gallatin.....	1 37 43
Joker, H. M. Sears.....	1 38 18
Zara, J. M. Sears, Jr.....	1 40 28
Papoose III., V. E. Macy.....	1 42 41
Astrild, H. L. Eno.....	1 43 32
Scud, A. J. Cassatt.....	1 45 06

Bayswater Y. C.

FAR ROCKAWAY, LONG ISLAND,
Saturday, August 1.

The Baywater Y. C. held a regatta on Saturday, August 1. The races were held under the auspices of the Jamaica Bay Y. R. A. The summary:

Dermio, E. M. Richmond.....	6 27 06	1 57 06
Lotus, W. N. Sherer.....	6 27 03	1 57 03

The winners were: Josephine, Elsa, Ellsworth, and Mae Louise.

Hempstead Harbor Y. C.

GLEN COVE, LONG ISLAND SOUND.

Saturday, July 25.

The Hempstead Harbor Y. C. held its annual regatta on Saturday, July 25. Owing to the lightness of the wind the start was delayed until one o'clock, but at that hour there was a moderate breeze blowing from the W. S. W., which held fairly true throughout the race.

Anoatok and Leda had a close race, the former boat led over the starting line by 36s. and finished ahead by the same margin. The summary follows:

Start, 1:05.		
	Finish.	
Spasm, E. B. King.....	4 08 04	
Anoatok, W. G. Brokaw.....	4 07 28	
Raceabouts—Start, 1:10.		
Hobo T. L. Park.....	3 19 05	
Jolly Tar, S. Howland.....	3 15 32	
Rascal, S. C. Hopkins.....	3 21 14	
Cricket, H. Willets.....	3 22 55	
Mavis, G. L. Prie.....	5 22 32	
25ft. Sloops—Start, 1:15.		
Spinster, Mr. Babbott.....	3 34 56	
21ft. Sloops—Start, 1:20.		
Quack, A. D. Tappan.....	Did not finish.	

Montauk, G. R. Sheldon.....	3 30 38
Gazabo, H. L. Vulte.....	3 48 45
Trouble, W. H. Childs.....	3 45 54
Jeebi, A. Brown.....	Did not finish.

18ft. Sloops—Start, 1:20.		
Flin-Flam, A. D. Prince.....	3 45 35	
Plover, Howard Place.....	3 55 47	

Manhasset Bay Class—Start, 1:25.		
Arizona, George Cory.....	Did not finish.	
Falcon, Stevens & Cole.....	Disabled.	
Lambkin, S. W. Roach.....	4 05 20	

New Rochelle Class—Start, 1:25.		
Knave, R. N. Pavier.....	3 58 24	
Deuce, N. D. Lawton.....	4 02 13	
Ace, A. Bavie.....	4 02 58	

Hempstead Harbor Class—Start, 1:30.		
Gosling, M. & T. Pratt.....	3 22 05	
Wif Waf, H. E. Sayre.....	3 30 51	
Scud, D. B. Abbott.....	3 21 15	
Why Not, W. Murdock.....	3 33 10	
Flicker, A. Hardy.....	3 25 16	

18ft. Cats—Start, 1:35.		
Coot, A. D. Prince.....	3 39 38	
Lobster, A. M. Brush.....	3 40 05	
Scout, A. E. Cerqua.....	Did not finish.	

21ft. Class—Start, 1:20.		
Arlene, A. S. Kendle.....	4 00 04	
Dunlea, C. A. Dunning.....	Did not finish.	

The winners were: Anoatok, Jolly Tar, Spinster (sail over), Montauk, Flim Flam, Lambkin, Knave, Scud, Coot and Arlene.

Newport Special Thirties.

NEWPORT, RHODE ISLAND,

Monday, July 27.

The race sailed by the 30-footers on Monday proved to be an exciting one. The contest was marred by an accident which narrowly missed being very serious. Vaquero III. was dismayed, but fortunately no one on board was injured. The accident was caused by the breaking of the boat's port spreader. A spreader also broke on Barbara which made it necessary for that boat to withdraw from the race. The contest was sailed in a heavy N. W. wind and the boats covered an eight mile triangular course. Vaquero III. was in the weather berth when she lost her mast. The committee boat towed her into the harbor. When Barbara withdrew, Carolina was in the best position, which she held up to the finish. The summary, start 3:56:

	Finish.	Elapsed.
Carolina, P. Jones.....	4 35 46	0 49 46
Breeze, W. G. Roelker, Jr.....	4 35 59	0 49 59
Raccoon, J. R. Drexel.....	4 37 31	0 51 31
Vaquero III., P. Whitney.....	Disabled.	
Barbara, W. Rutherford.....	Disabled.	

Tuesday, July 28.

Four of the Newport Special Thirties and two of the Buzzard's Bay one-design boats raced on Tuesday for special cups. Mr. C. L. F. Robinson gave the trophy for Newport 30-footers, and the Regatta Committee of the New York Y. C. gave the cup for Buzzard's Bay boats. The wind was fresh from the S. W., and the boats carried full sail. The course was from Brenton's Cove to Dyer's Island and return, a distance of 18 miles. This is the first time the boats of these two classes have met, and the Buzzard's Bay craft showed up to advantage in windward work. The winners were Vaquero III. and Mashnee. The summary:

Newport Thirties—Start, 3:00.		
	Finish.	Elapsed.
Vaquero III., P. Whitney.....	5 14 52	2 14 52
Breeze, W. G. Roelker, Jr.....	5 16 59	2 16 59
Carolina, P. Jones.....	5 17 45	2 17 45
Barbara, W. Rutherford.....	Did not finish.	
Buzzard's Bay One-Design Class—Start, 3:10.		
Mashnee, R. W. Emmons.....	5 19 10	2 09 10
Zingara, E. M. Farnsworth.....	5 21 15	2 11 15

Wednesday, July 29.

The Newport Special Thirties and the Buzzard's Bay one-design boats raced against one another in one class on Wednesday for a cup offered by Commodore Frederick G. Bourne, N. Y. Y. C. Owing to the heavy S. W. wind that prevailed, the Regatta Committee contemplated postponing the race, but as the owners of the boats were anxious to start, they were sent away promptly on time. The boats covered the Dyer's Island course, starting off Fort Adams. It was a reach to the Jamestown mark, a run to Dyer's Island, and a beat back to the finish. The strong wind and heavy sea seemed to just suit the Newport Thirties, for they had no difficulty in beating the Buzzard's Bay boats. The Newport boats showed up particularly well on the windward work, even though they were swinging full sail, while the Buzzard's Bay boats were reefed. Barbara broke her gaff and withdrew. Carolina finished a winner by a comfortable margin, and Vaquero III. was second. Carolina beat Mashnee 4m. 39s. The summary, start 3:10:

	Finish.	Elapsed.
Carolina, P. Jones.....	5 15 24	2 05 24
Vaquero III., P. Whitney.....	5 18 33	2 08 33
Mashnee, R. W. Emmons, 2d.....	5 20 03	2 10 03
Zingara, E. M. Farnsworth.....	5 21 04	2 11 04
Barbara, W. Rutherford.....	Disabled.	

Saturday, August 1.

Four of the 30-footers started in the race on Saturday. Mr. Pembroke Jones, owner of Carolina, and Mr. John R. Drexel exchanged boats and Mr. Jones won out handily. There was a good whole sail breeze from the S. The course was to the compass buoy in Coddington Cove and return, a distance of six miles. This gave the boats a run out and a beat back. Vaquero III. led on the run, having been first over the starting line, but on the beat back Raccoon worked into the lead and crossed the finish line 18s. ahead of Barbara, the second boat. The summary, start 3:25:

	Finish.	Elapsed.
Raccoon, J. R. Drexel.....	4 48 11	1 23 11
Barbara, W. Rutherford.....	4 48 29	1 23 29
Vaquero III., P. Whitney.....	4 48 54	1 23 54
Carolina, P. Jones.....	4 49 23	1 24 23

Monday, August 3.

The 30-footers sailed twice over a four-mile windward and leeward course on Monday in a light breeze. Barbara got away in the lead and finished an easy winner. Carolina withdrew. The summary, start 3:38:

	Finish.	Elapsed.
Barbara, W. Rutherford.....	4 47 07	1 09 07
Vaquero III., P. Whitney.....	4 48 41	1 10 41
Carolina, P. Jones.....	Withdrew.	

Penataquit-Corinthian Y. C.

BAY SHORE, LONG ISLAND.

Saturday, August 1.

The Penataquit-Corinthian Y. C. held its open summer regatta and the third special race for the Lighthouse cup on Saturday, August 1. The breeze at the start was strong from the N. W., but shifted later to the S. W. The boats in classes N, P, and T sailed over a course of seventeen miles, while boats in class Q sailed four miles, and in class W, eight miles. Wanda beat Flight 1m. 40s. on time allowance. The summary:

Class N—Start, 1:05.			
	Finish.	Elapsed.	Corrected.
Wanda, J. E. Roosevelt.....	3 30 30	2 28 30	2 25 12
Arrow, G. R. Macy.....	3 32 10	2 27 10	2 27 08
Flight, H. Havemeyer.....	3 32 03	2 27 03	2 26 53
Pinkie, Allen Pinkerton.....	Did not finish.		
Cornelia, F. F. Cousins.....	3 35 11	2 30 11	2 26 06

Class P—Start, 1:10.			
Frontenac, C. de H. Brower.....	3 37 45	2 27 45	2 27 45
Mowgle, J. D. Trask.....	Did not finish.		

Class Q—Start, 1:15.			
Dolphe, W. K. Dick.....	3 10 00	1 55 00	1 52 58
Kinkie, D. R. Coddington.....	3 18 30	2 03 03	2 02 25
Ouch, G. H. Potter.....	3 44 08	2 20 08	2 20 40

Class G—Start, 1:20.			
Arcyle, C. W. Leister, Jr.....	4 12 03	4 12 03	2 52 03

Class V—Start, 1:25.			
Grace, Joseph Robbins.....	3 34 13	3 34 13	2 19 13
Dorothy, A. Hadenberg.....	3 36 00	2 11 00	2 11 00

Class W—Start, 1:30.			
Scudd, J. V. Wooley.....	3 56 21	2 26 21	2 26 21
Helen, W. H. Wray.....	4 03 00	2 33 00	2 33 00

The winners were Wanda, Frontenac, Dolphe, Arcyle (sail over), Grace and Helen.

Erie Y. C.

ERIE, PA.,

Saturday, July 25.

The second series race given by the Erie Y. C. was sailed on Saturday, July 25. A good sailing breeze held throughout the race, and there was good racing between the boats. The summary follows:

30ft. Class—Start, 2:35.		
Una.....	3 56 50	Withdrew.
King Fisher.....	4 01 00	

25ft. Class—Start, 2:40.		
Iroquois.....	3 56 55	Mingo.....4 03 30
20ft. Class—Start, 2:45.		
Turtle.....	Withdrew.	

The winners were: Una and Iroquois. In the races so far Una has secured 20 points; King Fisher comes next with 19. CABIA BLANCO.

Corinthian Y. C.

STAMFORD, LONG ISLAND SOUND,

Saturday, August 1.

On Saturday, August 1, the Corinthian Y. C. of Stamford held races for power boats. Two classes filled and there were six starters. The summary:

17ft. Launches—Start, 3:45.		
Juliet, Palmer Brothers.....	4 55 50	Finish.
Dick, B. Goldfinger.....	4 56 18	
Launches Over 17ft.—Start, 3:40.		
Sally, J. S. Appleby.....	4 35 50	
Hartford, W. P. Hatch.....	4 39 30	
Genevieve, John Wilson.....	4 40 00	
No Name, O. Bavia.....	4 48 28	

The winners: Juliet and Sally.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Elsa II., the combination steam yacht and houseboat built from designs made by Messrs. Gardner & Cox for Mr. Evans R. Dick, of Philadelphia, was launched on July 20 from the yard of the builders, Messrs. James M. Bayles & Son, Port Jefferson, Long Island. The yacht is built of wood and is 113 ft. over all, 99 ft. waterline, 19 ft. breadth and 5 ft. 7 in. draught. She has twin screws, two four-cylinder triple expansion engines and two water tube boilers. Elsa II. is rather an unusual looking craft, with but little overhang forward, and considerable aft. There are two deckhouses and a single funnel. A single mast, used only for signaling, gives her rather a shippy appearance. The forward deckhouse is 19 ft. long and is used as a dining saloon; the after house is 16 ft. long and is fitted up as a library and lounging room. The galley, officers' and crew's quarters are forward, while the owner's apartments are aft. They consist of one double stateroom for the owner, which extends across the boat, and two single staterooms and two bath rooms.

Mr. Harry Payne Whitney has ordered a houseboat built by the Wilson Yacht Building Co., Ferry Bar, Baltimore, Md. She will be 100 ft. in length and will be driven by gasoline engines. The boat will be launched during October and then be taken to Palm Beach, Florida.

A short time ago there was launched from the yard of the Nilson Yacht Building Co. the auxiliary schooner yacht built by that firm for Mr. George C. Thomas, Jr., of Philadelphia. The yacht was named Ednada. She is built entirely of wood, the frames being of white oak and the planking of Georgia pine. Ednada is 110 ft. long, 20 ft. breadth and 6 ft. draught.

The fine auxiliary schooner Atlantic was finally launched on Tuesday, July 28, from the yard of the builders, Messrs. Townsend-Downey, Shooter's Island, S. I. The launching was marred by an accident that damaged the yacht somewhat. As she was sliding down the ways the hawser that held the cradle parted, and the yacht swept down the incline with a rush. She collided with a barge and carried away her taffrail and stove in some of the plates in her after overhang. This will delay the work of completing the yacht somewhat. Atlantic was built for Mr. William Marshall and she

was designed by Messrs. Gardner & Cox. When finished she will be the finest auxiliary yacht in the world. She is 189ft. over all, 13ft. waterline, 30ft. breadth, 21 ft. depth and 15 ft. draught. Her motive power consists of a triple expansion engine that will drive her at eleven knots. She will be rigged as a three-masted schooner. Mr. Marshall will make a cruise in the West Indies during the coming winter, and afterward is going around the world in the boat.

The Shelburne Y. C., of Shelburne, N. S., incorporated at the last session of parliament, has been formally organized with the following officers: Commodore, R. G. Herve; vice-commodore, Joseph McGill; rear commodore, John Ethrington, Jr. The club is growing rapidly, many additional citizens of the town having joined, as well as others from Boston, Yarmouth, Halifax and Lockeport. The regatta on the 4th, 5th and 6th of August bids fair to be a grand success, as already owners of yachts from several clubs have given notice of their intention to be present to compete for the coronation cup.

On Tuesday, July 28, Vergemere, the steel auxiliary schooner yacht built by the Harlan & Hollingsworth Co., Wilmington, Del., for Mr. Albert C. Bostwick, was launched. She was designed by Messrs. A. Cary Smith & Barbey. The yacht is 160 ft. over all, 120 ft. waterline, 28 ft. breadth and 16 ft. draught.

We are indebted to Mr. Harry Growtage, secretary of the Moriches Y. C., and to Mr. Andrew G. Weels, Jr., secretary of the Sippican Y. C., for copies of their club books.

Canoeing.

Prizes for Canoeists.

In order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of *FOREST AND STREAM* offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:
First, \$50.00.
Second, \$25.00.
Third, \$15.00.
Fourth and Fifth, \$10.00 each.
Sixth to Eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, N. Y., on or before December 1, 1903.

A Motor Canoe.

THREE summers ago the people of Newport and tourists passing through the harbor were often treated to the sight of a strange craft which moved with surprising speed through the waters around the city. In appearance the boat recalled to those who saw it dimly remembered pictures of islands in the South Pacific manned by meagerly clad natives, and if memory proved exceptionally active, it was possible to recollect that the vessels used in those remote waters are known as flying proas. The odd-looking boat seen around Newport was in fact nothing less than a flying proa, the achievement of Mr. Hugh L. Willoughby, a Newporter, who claims that city as his home the year round.

To an uninitiated observer there might not appear any great difference between a flying proa and the catamaran, the latter a type of boat much better known hereabouts than the former, although far from frequent. The main constructional differences between the proa and the catamaran are that the former consists of a vessel with an outrigger, while the latter is of twin boats attached parallel to one another. With the catamaran it is possible to beat to windward, while with the latter it is necessary to wear. The proa is a very swift machine, and Mr. Willoughby had lots of fun with his during the time he had her in commission. While the natives make their primitive craft from dugouts in many cases, the Newporter employed a 40ft. canoe as the main body of his boat.

Last summer, however, Mr. Willoughby's proa was supplanted by a still more interesting boat, the sight of which frequently amazes visitors to the City by the Sea. The owner of the proa conceived the idea that the use of a gasoline motor in a vessel built on the smooth lines of a canoe might result in the development of greater speed than has been reached in ordinary launches equipped with motors, and accordingly he dismantled the proa, purchased a Buffalo eight horse-power motor and installed

it in his canoe. The results have been somewhat surprising. The motor canoe Seminole is 40ft. over all, and with her motor aboard 30ft. on the waterline. Her deck beam is 2ft. 6in., her waterline beam 2ft. The motor is of the four-cylinder type.

The speed of an ordinary launch of the waterline of the Seminole equipped with a motor of the capacity carried by the canoe, would probably not exceed nine miles an hour. Last summer the owner of the Seminole reached an average speed of 11.7 miles an hour over a measured course, nearly three miles an hour faster than he could have gone in an ordinary launch. This did not satisfy him, however, and he spent the summer experimenting with propeller wheels and getting acquainted with his motor. When he finally found the kind of wheel best adapted to his boat he sent her again over a measured mile, and was delighted to discover that he could attain an average speed of 13.43 miles an hour, or about 50 per cent. more than a motor launch could do. There is no question as to this record, which was made with proper allowances for wind and tide.

"I have taken the Seminole out in pretty rough water," said Mr. Willoughby to a Sunday Journal representative, "and find that she is a stancher boat than might be expected. She has proved steady in a good sea off Beaver Tail, in spite of only 2½ft. beam.

For ordinary pleasure purposes there is no doubt that a launch of the length of the Seminole would prove preferable, for the canoe's carrying capacity is only two or three persons, but as a speed experiment she is a decided success. Her owner keeps her moored not far from his handsome Newport estate, which is just across the street from the Dickey place, recently purchased by Mrs. John Carter Brown, of this city. Mr. Willoughby goes in for speed on land as well as on the water, and is devoted to automobiling, spending much time in his handsome and swift touring car.—Providence Journal.

American Canoe Association.

YONKERS, N. Y., July 28.—*Editor Forest and Stream:* The inclosed amendments to the Racing Regulations have been adopted by mail vote by the Executive Committee of the Association, and been approved by the Commodore.

H. LANSING QUICK.

Rule I.—Amend first paragraph on page 26 of the 1902 Year Book to read (substantially) as follows: "All sailing races of the A. C. A., except such races for prizes as are, by deed-of-gift, defined as prizes for 16ft. by 30in. class, shall be open to both classes of canoe."

Rule III.—Amend first paragraph by the addition of the following: "No applicant for membership in the A. C. A. shall be allowed to race at the regattas of such Association; the participants in such regattas being limited to duly elected members in good standing."

Rule VI.—Amend the second paragraph, fourth line, as follows: "The prizes for any one camp shall be uniform in shape and design, as far as the financial resources of the Association will permit, and in the event of their not being uniform in shape and design, the Regatta Committee shall follow the spirit of this rule as far as it is possible." Also, add to this paragraph: "No so-called 'Club' prizes will be awarded where such racing events are recruited, at camp, from non-members of such clubs; this to apply to club sailing, club fours, and club war canoe races."

Rule X.—Amend the last paragraph, leaving it to the discretion of the Regatta Committee to determine whether members shall be in camp two days before racing, by striking out the words "except in war canoe races."

Rule XIII.—Amend, by striking out entire second paragraph, relative to disability by capsizing. This rule at present militates against the newer racing men, and, in view of the limited sail area now prescribed, is unnecessary.

New York C. C.

BENSONHURST, L. I.,
Saturday, August 1.

R. S. Foster won a record sailing event for open canoes at the N. Y. C. C. on Saturday, August 1. The boats covered a 1½-mile triangular course in Gravesend Bay. Decked canoes were out of commission ready for shipment to the annual encampment at Sugar Island. The summary:

Open Canoes—Start, 3:18.		
	Finish.	Elapsed.
R. S. Foster.....	3 43 20	0 25 20
W. Carmalt.....	3 45 50	0 27 50
E. J. Wright.....	3 46 05	0 28 05
J. F. Plummer.....	3 46 50	0 28 50
C. F. Speidel.....	3 47 30	0 29 30
A. M. Pool.....	3 49 10	0 31 10
R. S. Hawthorn.....	3 52 15	0 34 15
L. B. Jennings.....	3 53 00	0 35 00

Canoe Tilting Contest.

101 CLARK STREET, Brooklyn, N. Y., July 29.—*Editor Forest and Stream:* I would be obliged to the members of any canoe clubs, who have formulated regular rules for "tilting tournaments," for copies of such rules, as the Racing Regulations of the American Canoe Association do not, at present, contain any data on the subject, and I think it well to have the tournaments at the annual camp at Sugar Island conducted according to the best existing rules.

J. K. HAND,
Chairman Regatta Committee.

A. C. A. Membership.

The following have applied for membership to the A. C. A.:

Atlantic Division—F. M. Crispin, Paul McMichael.
EDWARD MULLER, Purser.

138 FRONT STREET, New York, N. Y., July 21.—The following gentlemen have been elected members of the Atlantic Division of the A. C. A.: A. S. Gregg-Clarke, Ed Lemoine Somerville, Ralph C. Porter, Frederick Leonard Adams, John Neilson, Elmer B. Ayres, Charles H. Parson, and A. W. Scott.

H. L. POLLARD,
Vice-Com. A. D., A. C. A.

MEDFORD, Mass., July 23.—The following application for membership to the A. C. A. has been received: S. Otis Ralston, Woburn, Mass.

O. C. CUNNINGHAM,
Purser E. Div. A. C. A.

Rifle Range and Gallery.

Fixtures.

Aug. 9.—New York.—Tournament of the West Side Rifle Club, West Fifty-seventh street. M. Sallway, Sec'y.

Aug. 16-23.—Union Hill Park, N. J.—Plattdeutsche Volksfest Verein annual festival and prize shoot.

Sept. 2-12.—Annual championship matches of the United States Revolver Association as follows: Sea Girt, N. J.; Chicago, Ill.; Woburn, Mass.; St. Louis, Mo.; San Francisco, Cal. Open to all. For programmes address H. W. Ott, Box 162, New York city.

Sept. 2-12.—Sea Girt, N. J.—Annual meeting of the National Rifle Association, New Jersey State Rifle Association and the United States Revolver Association.

The Palma Trophy.

As there has been considerable discussion over the rifle used by the American team in the Palma trophy competition, perhaps the following information, which is quite authentic, may interest your readers. The wording of the competition reads thus: "That the rifle to be used in the competition must be that of the standing army of the country represented by the team." It was thought at one time that our American visitors had used in the contest a weapon that had not been issued to the United States troops, which is, practically speaking, correct. However, it must be borne in mind that on the present occasion the Palma contest has come off much earlier in the year than previously, which was generally in September, and the 1903 shoot was only arranged for the sake of convenience and as an additional "draw" to the Bisley meeting. Some time ago the American War Office, not being satisfied with the barrel of the rifle in use, had another one constructed of a different pattern, the stock of the original weapon being retained, and the fresh turnout has only been issued to a few of the American troops; but it is absolutely in its present state as used by our visitors the future weapon of the Army of the United States of America, and in a short time all the men will be armed with similar rifles. The whole matter was very carefully gone into by a select committee of the N. R. A., when it was unanimously decided to allow our American friends to use the weapons in question. Had a veto been placed on the use of the weapon, it is just possible that the team from the United States might not have come over; so it was thus decided, in a true sportsmanlike manner.—Bisley in Shooting Times.

THE following is taken from the Philadelphia Public Ledger:

A committee representing the National Rifle Association, composed of Brig.-Gen. Bird W. Spencer, of New Jersey; Col. Bates, Seventy-first Regiment; Maj. Fiske, Seventh Regiment; Maj. James E. Beil, District of Columbia; Capt. Goddard, Philadelphia; Lieut. Smith and Dr. W. G. Hudson, New York, met the home-comers, and Gen. Spencer assured them that their victory, so well won, had done a great deal to stimulate the dormant interest in rifle shooting, and said that in the near future arrangements would be perfected by himself and the colonels of the regiments of the New Jersey National Guard for a large gathering, at which the medals won by the teams would be presented by Secretary of War Root.

Col. Bruce, in speaking of the trip, said: "Four of the party, including Gen. Spencer, Col. Sanger, J. A. Haskell, vice-president of the National Rifle Association, and myself, were elected honorary life members of the British association. We had a glorious time abroad, and after the team had won we all spent a few days in Paris. Just before we sailed from the other side we received a telegram from Lord Roberts wishing us godspeed.

"Our men worked earnestly from the moment they reached the English ranges, which, on account of their peculiar location, are very puzzling and difficult to shoot over with accuracy. We had as opponents representative military teams from Great Britain, Canada, Norway, France and Australia, and our men scored 1570 out of a possible 1800 points, establishing a record which was 15 points better than the total made by the winning team in the Elcho Shield contest, decided a few days afterward, in which the use of match rifles was permissible.

"The shooting for the Palma trophy was done under favorable conditions, except for the variable wind. On the long range the men had to shoot from one hill to another, and the currents of air between had to be gauged to a nicety, but our boys mastered the situation so thoroughly that, while the English team made a higher score than ever before, we beat them. As an instance of the progress made in rifle marksmanship the French team made a score that would have won fifteen years ago. Another remarkable point in the contest was the fact that it was the first match in which the English and the American teams did not miss the target once.

"At the end of the shooting over the shortest range the Englishmen led us by three point, but on the 900yd. range I took my time, as the wind was very tricky. I held my men for six seconds, in order to study the conditions, as I was determined to take no chances, and after careful observations, I gave the word. Sergt. Keough, of the Sixth Massachusetts, was the first man to fire, and he scored a bullseye, and five more followed in rapid succession. From that point to the end we kept ahead of the other competitors, and finally beat the Englishmen by 15 points, with the Canadians third, 52 points behind us.

"Many of our men took part in other matches, but we only used our national army rifle, and we were unable to shoot in many contests for this reason. Lieut. A. E. Wells, of the Seventy-first Regiment, won the best individual trophy, as he captured the Cheylesmore match at 1,000yds., scoring 48 points out of the possible 50."

Lieut. A. S. Jones, of the Ordnance Department of New Jersey, and secretary of the National Rifle Association, who accompanied the party, was enthusiastic over the successful trip.

"Our boys cannot be given enough credit for the way they overcame every known obstacle," said he. "They coached each other almost to perfection, and to this system of team work our victory is due. Before a man fired the men on each side of him took careful observations of the wind and mirage, and when they seemed to agree the shooter let go, and the result invariably was first class.

"We met some of the Irish experts at Bisley, who were here

two years ago representing the Ulster Rifle Association, and they could not do half enough for us.

"To show you how some individuals are taken up with sharp-shooting over there," he said, "I can tell you that one English gentleman who was present all through the Bisley meeting presented the Norwegians with \$7,500 to defray expenses to our ranges at Sea Girt, N. J., where the Palma trophy contest will be decided next year. The Australians and Canadians, as well as the English team, also will compete, and I believe that half a score of teams will be seen here next year. This same gentleman subscribed \$1,500 toward the expenses of the British team, and also gave \$500 to each of the other contesting national teams.

"The London Daily Telegraph notified the American Rifle Association that it will present us with a trophy for an annual challenge contest, the first match to take place at Sea Girt next year."

The American Team.

ON Saturday of last week the American team arrived on the Lucania. In an interview, Col. Leslie C. Bruce said:

"Nothing that I could say would give the English proper credit for the splendid way they treated us. We have brought back not only the Palma trophy, but two other prizes, both won by Lieut. Wells, of the Seventy-first Regiment. The result of the international shoot shows that the best marksmen outside of America and Great Britain are from British South Africa, Canada and Australia."

Before leaving Liverpool Col. Bruce received dispatches as follows:

Have sent you wire from Lord Roberts. All wish you prosperous voyage. CHEYLESMORE.

I am very sorry I have come too late to see you and congratulate your team on their splendid success at Bisley. LORD ROBERTS.

Col. Bruce replied as follows to Lord Cheylesmore:

The United States rifle team and myself are honored by the kind messages from the distinguished soldier Lord Roberts and yourself. We leave our good English friends with hearts full of gratitude.

Mr. A. L. A. Himmelwright, secretary-treasurer of the United States Revolver Association, New York, is at present sojourning in the West, where he will remain during several weeks. During his absence, the president of the Association, Mr. E. E. Patridge, of Boston, will attend to the secretary's office. Mr. Patridge is at present staying at Mingo Hill, Rangeley, Maine.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Aug. 6-7.—Marshalltown, Ia., Gun Club two-day tournament.
 Aug. 5-6.—Millport, Pa.—Oswayo Valley Rod and Gun Club's two-day tournament. M. S. Dodge, Sec'y.
 *Aug. 5-6.—Brownsville, Pa., Rod and Gun Club's tournament.
 Aug. 8.—Paterson, N. J.—All-day shoot of the Jackson Park Gun Club. G. H. Hopper, Sec'y.
 Aug. 9.—Jersey City, N. J.—All-day shoot of the Hudson Gun Club. James Hughes, Sec'y.
 Aug. 10-11.—Wolcott, N. Y.—Two-day tournament of the Catchpole Gun Club. E. A. Wadsworth, Sec'y.
 Aug. 11-12.—Fourth Alabama State tournament, under the auspices of the Birmingham Gun Club. R. H. Baugh, Sec'y.
 Aug. 11-12.—Culver, Ind.—Amateur shoot of Lake Maxinkuckee Gun Club. A. A. Keen, Sec'y.
 Aug. 12-15.—Toronto, Ont.—Annual tournament of the Dominion Trapshooting and Game Protective Association. A. W. Throop, Sec'y-Treas., Ottawa, Can.
 Aug. 15-16.—Milwaukee, Wis.—National Gun Club tournament. L. Collins, Sec'y.

**Members Southern Trapshooters' Game and Fish Protective Association. J. J. Bradfield, Sec'y, Vicksburg, Miss.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Clinton, Ont., Gun Club have fixed upon Oct. 8 and 9 as the dates for its tournament.

A midsummer shoot, with money and merchandise prizes, will be given by J. F. Schmeltzer and Sons Arms Co., Aug. 20-22.

Don't tell your brother contestant just how you missed that winning target; he is pleased enough that you missed it in any way.

Aug. 13, the Poughkeepsie and Ossining, N. Y., clubs will begin a series of team contests for a trophy presented for competition by the Poughkeepsie Club.

The first shoot of the third series given by the Garfield Gun Club, of Chicago, had winners as follows: Class A, J. D. Polard; Class B, M. F. Wilson; Class C, C. H. Kehl.

Mr. A. Meyerhoff, a valued attache of the U. M. C. Co., returned to his desk at 315 Broadway, New York, on Monday of this week, much improved in health as the result of a long outing.

The stronger shot has two opinions of the weaker shot in sweepstakes; one opinion he expresses, the other he conceals. The expressed opinion is that the weaker shooter is "dead game."

The Lake Maxinkuckee Gun Club, of Culver, Ind., has fixed upon Aug. 11-12 for an amateur shoot. The officers are S. S. Chadwick, president; A. A. Keen, secretary; W. M. Cook, treasurer.

The committee of the Rochester Rod and Gun Club announces that \$100 will be added to the purses; also that important sums will be awarded for the high averages of the club tournament, Sept. 2 and 3, Rochester, N. Y.

At the Interstate Association tournament, July 30-Aug. 1, given for the La Crosse and Viroqua, Wis., gun clubs, Messrs. Hirschy, Riehl and Hughes were highest in the averages. Mr. H. Morrison was high in the amateur averages.

Mr. W. T. Irwin, trap editor of the Sportsman, states: "Chicago is desirous of getting up a telegraph match with New York. Better try some Western city to make it a go." We had heretofore believed that Chicago was a Western city.

At the Newark, N. Y., Gun Club shoot on July 30, Mr. Frank E. McCord, of the Rochester Rod and Gun Club, was high average. Mr. L. V. Byer, of the same club, was second high average, and Alderman Meagher, of Syracuse, was third.

At the tournament of the West Fairview, Pa., Gun Club, Aug. 1, a seven-man team match between that club and the Columbia, Pa., Gun Club, resulted in a victory for Fairview by a score of 117 to 103. A return match will be shot at Columbia on Labor Day.

The Goderich, Ont., Shooting Association announces that its second annual tournament will be held on Sept. 7 and 8. Programmes will be ready later. For further information, apply to either the president, D. McIves, or the secretary, N. D. Rougvie.

"Crain," of Easton, Pa., writes us that at the shoot of the Independent Gun Club on Saturday of last week, Mr. Jacob Pleiss broke the club record by breaking 99 out of 100 bluerocks; also that he made a run of 64 consecutive breaks, which is also the record of the grounds for a long run.

Mr. E. J. S. Miller informs us that at a recent meeting of the Concord Junction, Mass., Fish and Gun Club, officers were elected for the ensuing year as follows: President, D. L. Ball; vice-president, S. Farquor; treasurer, F. W. Reed; secretary, E. J. S. Miller; range finder, J. R. Brown.

The Parker Gun Club, of Meriden, Conn., announces its ninth annual Labor Day tournament, to be held on Sept. 7. That popular and equitable event, a Bristol sheep bake, will be a carefully prepared feature. All are invited. Programmes will be mailed on application. Address the secretary for them, Mr. C. S. Howard.

Mr. Alfred Griesemer, Allentown, Pa., will hold his second annual tournament on Aug. 18 and 19, at the Duck Farm Hotel. There are ten events on the programme, at 10, 15, 20 and 25 targets; 75 cents, \$1, \$1.50 and \$2 entrance. Prizes to first and second highest averages. Targets, 2 cents. Shooting commences at 10.30. Class shooting.

Mr. J. S. Fanning, of the Laffin & Rand Powder Co., and Capt. G. E. Bartlett, of the Peters Cartridge Co., were visitors in Denver, Colo., recently. Each gave an admirable exhibition of great skill in shooting. They contemplated a visit to Colorado Springs to shoot and witness the contest between Messrs. Schemwell and Garrett for the Post trophy.

Mr. C. R. Borland, chemist of the American E. C. and Schultze Powder Co., Oakland, N. J., sailed for England on Aug. 1. The directors of the company have granted him a two months' leave of absence, which he will devote to a sojourn in England. The officers of the company speak in the highest terms of praise concerning his professional ability and industry, and consider his vacation as being well won.

The programme of the Lake Maxinkuckee Rod and Gun Club, Culver, Ind., Aug. 11-12, has a like number of events for each day—fifteen events, 10 and 15 targets, \$1 and \$1.50 entrance; a total of 200 targets at \$20. Average money, \$25. Mr. A. A. Keen is the secretary. Targets, 2 cents. Shooting commences at 9 o'clock. Purses divided 30-30 and 20-20 per cent. Ship shells to Mr. W. Cook. Free moonlight ride on steamer Mees-wau-gee, Aug. 11.

Mr. Edward Banks, secretary Wanderers, has issued the following club information: "The Wanderers—Saturday, Aug. 8—Jackson Park, Paterson, N. J. Take Singac trolley from Paterson City Hall. Trolleys leave every twenty minutes. Thursday, Aug. 13, all-day shoot at Brooklyn Gun Club. Take Kings County "L" to Crescent street station. Saturday, Aug. 22, Wanderers' field day at Frog Inn, Jamaica Bay, L. I., N. Y. Details later."

Mr. E. C. Meyer, formerly a resident of Rochester, N. Y., and a member of the Rochester Rod and Gun Club, is now domiciled at Georgetown, S. C., where he has superintendence of the saw-mill interests of Mr. J. Pierpont Morgan. He has been actively interested in the organization of a gun club there, and has one started with a membership of between 40 and 50. Mr. Meyer is an expert trap shot and skillful in all the details of tournament management.

Mr. John S. Wright, manager of the Brooklyn Gun Club, has issued a poem, which reads as follows: "All day shoot, Aug. 13. Handicap events for prizes. Shooting commences at 10:30 A. M. Expert traps, Gilbert pull. Magautrap. Lunch. Distance handicaps, and all the shooting you want. Ship shells to Brooklyn Gun Club, care of John G. Torborg, 1043 Liberty avenue, Brooklyn, N. Y. Take Kings County "L" to Crescent street station. Stages direct to the grounds."

The programme of the second annual tournament of the Goderich, Ont., Shooting Association, Sept. 7-8, provides ten events on the first day, at 10, 15 and 20 targets, \$1, \$1.50 and \$2 entrance, and nine events on the second day, the second of which is at 100 targets, \$10 entrance, for the Robin Hood trophy. The third event is a merchandise event, 10 targets, 50 cents entrance. The fourth event is the two-man team race, 20 targets, \$1 entrance. Sliding handicap. Targets, 2 cents. Class system.

The Philadelphia Press recounts a happening of exceptional novelty, which occurred at Allentown, Pa., on July 30, as follows: "During a severe thunder storm last night a bolt of lightning went down the chimney at the house of Lewis D. Leidy, in Lynn Township. It penetrated the ceiling of the kitchen, setting it on fire. It then darted across the room and down the barrel of a shotgun, which was standing in a corner. The weapon exploded. The members of the family escaped serious injury. The fire was soon extinguished."

The Florists' Gun Club, of Philadelphia, Pa., has issued the following circular letter: On Saturday, Aug. 8, there will be an open handicap tourney on the Florists' Gun Club grounds, Wisconsin. The conditions will be 100 targets, speed handicap, sweepstake entrance, \$5, targets \$1.50. The purse will be divided, high guns, one money for every three entries. The Florists' Gun Club will hold an open amateur tournament Sept. 30 and Oct. 1-2. One feature will be a 100-target speed handicap. Arrangement has been made to stop the 1.10 P. M. train from Broad street on Saturdays.

The programme of the Catchpole Gun Club summer tournament, Aug. 10-11, at Walcott, N. Y., provides six events on the first day, total of 90 targets, \$8.10, and ten on the second day, total of 160, at \$14.40. Moneys divided, 40, 30, 20 and 10 per cent. Magautraps and bluerocks. Other information as follows: "Professional trap shots and manufacturers' agents are invited to visit with our president, 'Uncle Ben,' the oldest shooter in the Empire State; and also shoot for price of targets. Every effort will be made by the management to make this shoot a success. Come and bring your friends. In event 7, prize L. C. Smith hammerless gun, value, \$37.50. Ties in this event miss and out. Distance handicap. First average prize for entire programme, \$5 in gold. Second average prize for entire programme, \$3. Lowest average prize for entire programme, 200 Peters high grade loaded shells, value, \$5." Mr. E. A. Wadsworth is the secretary.

BERNARD WATERS.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., July 30.—In event No. 4 to-day, for the Marshall cup, Traver and Du Bois tied on 22. The tie was not shot off, but on Thursday next it will be decided who is the winner.

Next week we shoot for two cups, and hope to see a good attendance. On Thursday, Aug. 13, this club will put up a trophy, and a series of shoots will be begun between this and the Ossining Club.

Ten-man teams will shoot through this series. We hope to be more successful in these contests than we were in those of the inter-county cup series:

W. H. GRIMSHAW, Sec'y.

Interstate Tournament at La Crosse.

LA CROSSE, Wis., Aug. 1.—The La Crosse-Viroqua Interstate Association tournament closed here this afternoon, and it may well be ranked among the best target tournaments held anywhere this year. While the Interstate series has been successful to a degree this year, this was especially so in Mr. Shaner's opinion, in its fulfillment of the aims of the Association in this work. Both clubs entered fully into the spirit of the work, providing every facility and accommodation, and when Shaner gets this kind of support his remarkable genius as a tournament manager eclipses all obstacles to success, if any there were.

The writer has attended few tournaments where a greater local interest was manifested. A thousand people visited the grounds as spectators the second day, and paid closest attention to the shooters. And the entries far exceeded even Shaner's expectations. The first day there were seventy names on the list, and the second day eighty. It kept the two sets of expert traps going at a lively gait, but the programme was finished each day in good time, and Mr. Hirschy in the office kept the books right up to the game. Money contestants were handicapped, and professionals shot from scratch. The Rose system of division was used, and points paid very well throughout.

Honors on the various days were won as follows: Thursday—Hirschy 158, Riehl 153, Lord 150. Friday—Waters 159, Riehl 158, Hirschy 156. Saturday—Hirschy 153, Hughes 151, Riehl 146.

The amateur honors went on the respective days to Chingren, Crosby and Canfield.

The honors for the tournament were won by Hirschy, Riehl and Hughes, and the amateur average for the week went to Harry Morrison. The detailed reports follow:

July 30, First Day.												
Events:	1	2	3	4	5	6	7	8	9	10

Hardly any article is so universally needed by the out-door man as a good field glass, and the field glasses of to-day are very different from those of a few years back. The Hensoldt is a one-prism field and marine glass, very highly thought of in Germany, Russia and England. Messrs. Von Lengerke & Detmold are the sole agents for the United States.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, AUGUST 15, 1903.

VOL. LXI.—No. 7.
No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

THIRTY YEARS.

THE first number of the FOREST AND STREAM was dated August 14, 1873. The issue of this week completes a term of thirty years. The occasion is one which prompts a backward glance and a look ahead. The period of thirty years between 1873 and 1903 has witnessed vast and far reaching changes in the special field which the paper has made its own. The sportsman of to-day confronts conditions vastly different from those that prevailed then. The transitions have been more marked in character than those which took place during a century before, and we may well believe that a century to come will not witness changes so radical and complete. The three salient features of the period have been the multiplication of sportsmen, the decrease of game, and the development of the game protection idea. Each one of these of course may be appreciated fully only by the elders who can compare the present with that vanished past in which they had part. The young man of 1903 knows the buffalo only as a curious specimen in zoological exhibits or of book lore. Almost as much might be said relative to the mountain sheep, the mountain goat, and the antelope, now so extremely rare and their pursuit so hedged about by restrictive laws that it is only the man who is specially favored of fortune who may hope to see them in their native wilds. So, too, with the game birds, of which the supply and the shooting are in marked contrast with the abundance and the conventional license of a quarter century back.

While in America we are in sad straits as to our big game supply, there is yet abundant reason for encouragement. As a people we have been blind, but to-day we see. If proof of this is demanded, it may be found in our codes of game laws yearly becoming more stringent in their provisions. Whereas in the old days the notion that the killing of big game might be restricted by anything else than the endurance and skill of the hunter would have been resented by the average individual, we have now come to the color of hair and eyes stage, where we recognize that we may take game only "in the manner, to the amount, and for the purpose" duly set out in the law. In short, we have acquired an entirely new way of looking upon our game resources, an entirely new appreciation and recognition of the relations which hold between the individual sportsman and his fellows with respect to the game supply. In these thirty years we have advanced a hundred in common sense.

The hosts of sportsmen now where there was a single one before mean, too, that the game will be all the longer assured to us. When those who were enlisted in protection were comparatively few, they were weak in influence, and their cause was weak. Now that the many are concerned, their cause is strong. We have reached and passed the limit in indifference and negligence as to our game; all signs of the times point to enlarged public appreciation and concern, and to a system of game preservation more and more adequate to conserve the resources of field and mountain.

The years bring their own problems; a journal of and by and for sportsmen can do no better service than to supply a medium for their discussion.

SNAP SHOTS.

WE print the communication signed by Lexden relative to that of Mr. Spears in our last issue chiefly for the reason that the misapprehension shown by the writer of this week may be shared by others, and should be corrected. Lexden finds the article written by Mr. Spears anarchistic and communistic. A careful reading of it will show that it is neither. We think the saying of this worth while, for one reason because we do not mean to publish articles which are anarchistic, and we are therefore somewhat jealous of the good fame of our columns. What Mr. Spears advocated was the taking over by the State, in ways duly provided by law, Adirondack territory, and converting it into a park for the public. One of the east windows of the FOREST AND STREAM office overlooks, not far away, a grateful bit of green sward in Mulberry Bend Park. The park was formerly the site of a congeries of tenement houses which were among the most unsanitary and squalid in the city. The municipality bought the tenements and removed them, and put in place of them a breathing place for a congested quarter. We have never heard any charge that this action by the city was anarchistic. In principle the Adirondack Park proposition is similar; and wherein it is any the more anarchistic does not at first blush appear. There is now before Congress a proposition to set aside an extensive tract of mountain country in Southern States as an Appalachian forest preserve. The proposal has already been given approval in one branch of Congress, and its advocates have confidence that in an early session the plan will be adopted. We have yet to learn that there exists any opposition to it based upon the ground that it is anarchistic. If a city may acquire tenement property for park purposes, and if the United States may acquire mountain forest lands for park purposes without involving anarchy in the doing of it, we fail to appreciate the reasonableness of the view that if the State should acquire land for park purposes that would be anarchistic.

JOHN W. TITCOMB, chief of the fishcultural branch of the Bureau of Fisheries (as the United States Commission of Fisheries is now termed under the Department of Commerce and Labor), will sail from New York on September 2 for Argentina. He will go at the instance of the Argentine Government, which requested through the State Department that he might be detailed for some special work of investigation in Argentina. The Argentine Government has never done anything in the way of developing their fisheries, and want to introduce the *Salmonidae* of this country, if it is practicable. In the southwestern portion of the country there are many large clear water lakes, and some clear water streams which will, perhaps, be found suitable for the support of the species. Mr. Titcomb will go to Buenos Ayres, and from there proceed southwest toward the foothills of the Andes in what is called the Neuquen region. He expects to be absent from this country six months. Mr. Titcomb's familiarity with the subject and his experience and information admirably equip him for this work, and we trust that his quest for suitable waters for our northern species may result in adding a substantial factor to Argentina's food fish supply, and introducing the Argentine angler to the pleasures of angling for salmon and trout.

A CONDITION of the thirty years' publication of FOREST AND STREAM well worthy of note is the continuing representation in its pages of advertisers who were there in the issue of August 14, 1873. This is a record which cannot be surpassed, and it is one in which a just pride is felt. To have been awarded this uninterrupted patronage for such an extended term is something which testifies in a most substantial way to the paper's usefulness and value as an advertising medium.

MR. JOHN G. HECKSHER, of this city, has recently contributed \$100 to the fund for placing an Izaak Walton memorial window in the cathedral containing Walton's tomb. The project has been under way for some years, but appears to have languished.

EARLY STEAMBOATING ON THE MISSOURI.

THERE is no natural feature of North America about which clusters more of interest and of romance than about the Missouri. The longest river in the world, it was for almost three-quarters of a century the chief road by which the northwestern portion of the United States was reached, and, more than any other highway, it influenced the upbuilding of the whole western country. "The business of the fur trade, the intercourse of Government agents with the Indians, the campaigns of the army throughout the valley and the wild rush of gold seekers to the mountains, all depended in greater or less degree upon the Missouri River as a line of transportation." For nearly eighty years from the time when Lewis and Clarke sailed, rowed and cordelled their keel boat up its tortuous course in 1804, to the date when the Northern Pacific and Great Northern Railroads had built their lines to the Rocky Mountains, the great river was the scene of business activity, of thrilling adventures and of picturesque happenings.

No theme could be more interesting for the pen of historian or romancer than the story of the big river, and, indeed, many incidents of the tale have been told; but until the present time no attempt has been made to write its serious history. This, however, has lately been done by Capt. Hiram Martin Chittenden, well known through his other works, the "History of the Yellowstone National Park" and the "American Fur Trade of the Far West." His work is entitled "History of Early Steamboat Navigation on the Upper Missouri River, Life and Adventures of Joseph La Barge, Pioneer Navigator and Indian Trader," for fifty years identified with the commerce of the Missouri Valley.

The present volumes are the direct outgrowth of Capt. Chittenden's investigations into the American fur trade, for it was while engaged in collecting data for the history of that industry that the author met Capt. Joseph La Barge, an aged Missouri River pilot. The long experience of this veteran impressed Capt. Chittenden with the importance of recording his memories of early Western history, and the author took down from Capt. La Barge's dictation full notes of his life. Before these could be published Capt. La Barge died; and as the material was more fully considered, it appeared that his memoirs were largely the history of steamboat navigation on the Missouri River. The scope of the work now underwent a material change, and while Capt. La Barge still remains its central figure, it has been expanded to include the history of navigation on the river.

Incidentally, a vast deal of collateral matter is brought in. Aside from the details of early navigation, much is told of the influence had on that navigation by the fur trade, the Civil War, the discovery of gold in Montana, the dealings with the Indians and the army. At last came the battle of the steamboats with the railroads, and the final decline of the river as a highway. For many years after the railroads had absolutely killed trade upon the Missouri River; the Government waged an unequal war with destiny and struggled to maintain freight traffic along the river.

The Missouri River Commission was created in 1884, and while it did much useful work and protected much property, it did nothing whatever to improve freight traffic on the Missouri, and was finally abolished by Act of Congress, June 13, 1902.

Capt. La Barge is the central figure of the book. It is largely devoted to his life and adventures, successes and failures. Yet the work tells much of the Missouri River, the boats used on it and many of the earlier voyages, especially those between 1843 and 1863. Clearly painted pictures are given of the river life on the river in those early days, and the strange characters inhabiting the country, and developed by the life. Capt. La Barge commanded the steamboat which took Audubon, the naturalist, up the river, the time consumed being 49 days from St. Louis to Fort Union, which they reached June 12. During the voyage up the river in the following year, an amusing incident occurred as to buffalo. The provisions furnished by the fur company for the crew of the Nimrod were scanty and the

men soon longed for fresh meat. They grumbled more or less, because they were delayed by the water in getting into the buffalo country, and to satisfy them Capt. La Barge told them that the first buffalo they saw they should have, even if it were necessary to stop half a day in order to get it. The first mate of the boat, John Durack, had been on the river before, but knew nothing about buffalo.

"When the boat reached the vicinity of Handy's post, four buffalo bulls were seen swimming the river. 'Man the yawl, John,' said La Barge. 'I will go with you and we will have a buffalo before we get back.' The captain gave orders to the men on the boat to shoot the buffaloes, and he would lasso one of the wounded ones and drag it to the boat. He put Durack in the bow with a line, while he took the rudder. The men on the steamboat fired and wounded two of the buffaloes. To get to the wounded ones, the boat had to pass close to the two uninjured ones. The captain supposed that Durack fully understood the programme, but the mate was not 'up to buffalo,' and to La Barge's consternation slipped the noose over the head of one of the uninjured animals. Too late Capt. La Barge shouted to him not to do this—that he did not want to anchor to a live buffalo. 'Oh,' replied Durack, 'he's as good as any.' The buffalo kept straight on his course. Finally his feet touched bottom and up the bank he went with the boat and its helpless crew after him. They might indeed have taken a boat ride over the bare prairie had not the stern of the yawl given way, being wrenched entirely out of the boat and carried off by the terrified animal. There stood the sorry crew, shipwrecked on a sandbar across the river from the steamboat—and with no buffalo. A whole day was consumed in getting back to the boat and in repairing the broken yawl. Meanwhile the crew kept on eating salt pork and navy bread."

If amusing incidents were frequently occurring on the river, not less was it a scene of fights with Indians, of desperate crimes by white men and of perils of a hundred kinds. It was during one of Capt. La Barge's voyages in 1851, that the cholera broke out on the boat. Among the passengers were two distinguished Jesuit missionaries, Father Hoecken and Father De Smet, as well as a Dr. Evans. Father De Smet was already ill, but the other two worked heroically over passengers and crew, and Father Hoecken so exhausted himself that he fell a victim to the disease and died, sacrificing himself to the call of duty, as have so many noble men belonging to his order.

Father De Smet was one of the best known Jesuits in all the Western country, and he is still remembered and talked of on the upper river. One of the tales given of him by Capt. Chittenden is as follows:

"Although the spring of 1851 had been very backward and wet in the lower country, it was not so higher up, and when the St. Ange arrived at the Aricara villages, the corn crop of those Indians was found to be actually suffering from drouth. The Aricara chief, White Shield, came on board and said to La Barge, who understood his language well:

"I am glad to see you, and I hear the Black Robe is on board."

La Barge replied that that was so. The chief then continued:

"I want to ask him a favor. It is very late in the season and no rain. Corn ought to be up now. We want the Black Robe to send us rain."

"La Barge took the Indian back to De Smet's room and said to the priest: 'Father, here is the White Shield, who wants you to make it rain, for the corn is not yet up.'

"De Smet, who knew the White Shield well, laughed heartily, and said he would do all he could. He then asked La Barge if the boat was going to remain there all day, and being informed that it was, he said to the White Shield: 'Go to your villages and put your lodge in order and call in some of the chiefs. I will come and offer prayer to the Almighty and ask him to be merciful and grant your request, and I am satisfied that, if you deserve it, the Great Spirit will look down and favor you.'

"Capt. La Barge and several of the passengers went along with the father, and the interpreter translated the prayer to the Indians. They left the Indians satisfied, and at noon had them on the boat for a feast, after which they returned to their villages. As good fortune would have it, along about three or four o'clock in the afternoon there came up a heavy thunder shower, which fairly deluged the place. Father De Smet laughed and said:

"They will think I did it. They will give me all the credit for it."

"Some time after the shower Pierre Garreau, a French-Canadian, who had spent all his life among the Indians, and had become almost an Indian himself, came to the boat and said to La Barge:

"I want you to help me. I want to find out how

Father De Smet did that."

"Did what?" asked La Barge.

"Made it rain. I will pay a good price if he will tell me. I will give him ten horses."

"La Barge took him back to De Smet, where he presented his request himself. De Smet told him to be a good Christian, and pray when he wanted it to rain, and if he deserved it, it would come. Garreau went away disappointed, for he fully believed that the Father had some secret art by which he produced so signal a result. After he had gone, De Smet laughed, and said: 'Did I not tell you they would say I did it?'"

Naturally the volumes abound in anecdotes of Capt. La Barge who, besides being a man of great courage and energy, had also no little sense of humor. A story of one of his early voyages is perhaps the basis of several similar later tales that have been published of other people.

It is said that on one of the captain's trips up the river there were several Englishmen among the passengers. They had a map, and for the first day or two spent much of their time trying to identify the various places marked on it with those that they passed. They were in the pilot house a good deal, and one of them questioned La Barge rather officiously about the geography of the country:

"What place is this that we are approaching, Mr. Pilot?" he asked.

"St. Charles, sir," La Barge replied.

"You are mistaken, sir; according to the map it is ———"

"La Barge made no reply. He stopped as usual at St. Charles and then went on his way. Presently they came to another village.

"What place, captain?" inquired the Englishman.

"Washington, Mo., sir."

"Wrong again. The map gives this place as ———"

"This experience was gone through several times, the captain's temper becoming more ruffled with each repetition, though no one would have suspected it from his unruffled exterior. Presently a flock of geese passed over the river and drew the attention of the passengers and crew. The Englishmen were standing on the hurricane roof immediately in front of the pilot house.

"What kind of birds are those, captain?" asked one of them in eager haste.

"The captain, whose language still smacked somewhat of the French idiom, replied:

"Look at your map; he tell you."

Capt. Chittenden's work is in two volumes, uniform with Dr. Elliott Coues' "Forty Years a Fur Trader" and "On the Trail of a Spanish Pioneer." It is illustrated with sixteen plates, one a map of a short stretch of the Missouri River channel, showing the different courses followed by the river in the years 1804, 1852, 1879 and 1894. A number of the illustrations are portraits of historic characters, such as La Barge, Culbertson and Kenneth McKenzie.

We have earlier called attention at some length to the very valuable work that is being done by Capt. Chittenden in gathering historical material concerning the old West. It is gratifying to see how rapidly the interest in this great section of our country is growing, and to observe the starting up of historical societies all over the West. Capt. Chittenden is a young man, and we may look forward to much of value from his pen in the years that are to come, but even if he should never write another line, his fame may well rest on the volumes that he has already produced. Of these the history of boating on the upper Missouri is one of fascinating interest.

THE proverbial Virginia hospitality is again in evidence. That State has a new game law this year of which one feature is a non-resident license exaction. As at first adopted, all non-residents other than non-resident children of resident landowners were required to take out a license, but the spirit of hospitality which is linked with the name of Virginia recoiled at this. From a time beyond which the mind of man runneth not to the contrary, it has been a fashion with Virginians to invite their friends from other States to visit them for shooting; and it was perceived that the new law would put an end to this pleasant custom. A modification was thereupon demanded and granted. As it now stands, the non-resident law expressly exempts the visitor, the text reading that the non-resident guest of a resident landowner shall be allowed to hunt on the lands of his host as though he were a resident of the State, when accompanied by the host or a member of his family, and provided that the host receives no compensation from the guest.

This is excellent in so far as Virginia hospitality is concerned; but we fail to appreciate the logic which finds it reasonable to tax one sportsman who is obliged to pay board in Virginia, while exempting him who is so fortunate as to have friends there who may entertain him.

The Sportsman Tourist.

In the Wilds—A Memory.

The joys I have possess'd are ever mine;
* * * * *
Hid in the sacred treasure of the past,
But bless'd remembrance brings them hourly back.
—Dryden.

Emerson Carney, in FOREST AND STREAM of May 2, regretted that there are so many stories of woods and plains remaining untold, which determined the writer to record a memory of many years ago, at the first opportunity, hoping that it may stimulate other old sportsmen to do the same.

Away back in the early seventies, when the scribe was a good many years younger than he is now, he ran across a local tradition while on a little fishing tour. This ran as follows: that there existed a small lake or large pond, away in the depths of the forest near Red Mountain (a distant neighbor of Megantic, in Canada), that contained the largest pike ever known of in that part of the country. That some years ago a party of three stumbled upon it by accident, and being short of provisions they built a raft and went out to try for some fish. That they soon caught a monster, and while trying to pull it upon the raft, one of their number, reaching down to catch the fish by the gills, got his hand caught by a snap of the great jaws, and was promptly drawn into the water. As he was disappearing, a second man caught him by the ankle and was fast following the first, when the third caught on, and between them, rescued their drowning companion from the jaws of—death—the fish. The latter got free in the struggle, and the man's hand was so mangled and poisoned that they feared for his life, and they had to get out to the settlements at once, without bringing anything with them as proof of their story.

Now, if there is anything on earth that fills one with a soul-satisfying fullness, it is a good fish story; and here was one that met all the requirements! Here the mystery and remoteness of the great forest; the vagueness of location; the inaccessibility; the indeterminate greatness in size of the fish; the danger attending the capture of such monsters; in fact, everything that is needed in the telling of a fish story.

Then, of course, after the discovery of the tradition, comes the investigation of the source thereof. All who claim to be true anglers never hesitate to believe in a fish story, because they want their own little tale credited, but they like to receive it from the original teller or fountain head, and not to have to take it warmed over, as it were.

And so it came about that after having heard this entrancing tale, the scribe started in to hunt the heroes down. At the very start he found that the party who had been bitten and nearly drowned, was dead. It was reputed that he died of a fever, but from later experiences of his own, the scribe believes that he died of a broken heart, caused by the loss of so wondrous a prize. Then it proved that a second member of the party had left the country, and his whereabouts were unknown to all his old acquaintances. In fact, it was hinted that had he been come-atable his word would not carry very much weight. So the third member of the trio was inquired for, and it was found that the belief existed that he lived in the adjoining county, some thirty miles away, and was a man whose word could be depended upon. The scent was getting warm, so on the first favorable opportunity he was duly hunted down and questioned.

The man was a farmer, and was found in his corn-field, where he and two sturdy sons were busily engaged in "hillin' up" the lush green stalks. It was a warm June day, and he was very busy trying to finish the work so as to get a day off to "go a-fishin'" before his hay harvest came on; so he later informed his questioner.

"Wal! Wal!" said he, on learning Scribe's errand, as he stopped work and leaned on his hoe handle and wiped the sweat from his forehead with a hooked forefinger, "it beats the nation how folks has got me mixed up in that story. I swan to man it does! I've denied it forty-seven times, I reckon, but it don't seem to do no good. Guess it's 'cause everybody knows 't I like t' go a-fishin'"; and he meditatively spat a large mouthful of tobacco juice on a June bug that was helplessly kicking its legs in the air, as it lay on its back in a hoe-track.

"I'll tell ye the hull story, as fur as I know ont. Ol' Sol Jones, 't used to live over on the concession, tol' me the story soon arter it happened, an' altho' he was the gold-durndest liar in seven caunties, I believed the heft ont, 'cause he was a good fisherman."

There it is again, you see! He believed "the heft ont" because the man was a brother fisherman!

"He tol' me that he an' his brother Lem, an' a feller the name o' Jim Bradley, all on 'em skeddaddlers from the State o' Maine, come into Canada in '62 to avoid the draft. They was all lumbermen, an' old woodsmen an' hankered to foller the old trade. So one day, the same summer they come over the line, they started into the forest, east o' Red Mountain, to explore a bit an' see 'f they cud run across some pine. They was aout a quite a spell, an' one day they come to a large pond saouteast o' the maountain, an' as Sol had some fishing gear along, they built 'em a raft an' went aout a-fishin'. Putty soon Sol got hitched to an' ol' sockdologer 't fit like the nation. Bumbye the fish got tuckered aout, an' come up clost to the raft, an' Jim reached daown an' made a long grab fur his gills, an' got his thumb in the fishes maouth. The ol' cuse bit ri' daown ont, sost hurt like sin. Jim wanted some body to help him leggo about that time, but yu know how them critters' teeth be, all set backwards, an' the more Jim pulled the more the fish wouldn't leggo. Between the pain an' the pull o' the fish, Jim leaned over too fur, an' went k'souse, headfust into the water. This loosened the fishes holt, an' Sol caught him by

he foot an' yanked him back on the raft. The pike took advantage o' the muss, an' went off wi' the gear; look, line an' sinker, an' that settled the fishin', as hey hadn't no more line. I've off'n thought as haow 'd like to go an' try that place myself, some day." And he again deluged the poor bug that was still leebly kicking, and rubbed his mouth with a sigh.

"Come with me," said the Scribe, "and we will get nother good man or two, and go next week?"

"Consarn the luck I can't du it! 'F there's anythin' in the world I du luffter du, its t' go fishin', but I can't spare the time jest naow. I've ben a-workin' like tew men all the week so's t' get off next Sadady for a day's fun, an' that's all I can spare before my nowin' begins."

"Come, come, boys! Don't stan' thar a-sucklin' yer toes tew long!" he called to his boys, who, with hands crossed upon the ends of their hoe handles and breasts leaning thereon, were eagerly lending their ears to the conversation. With boyish snickers they resumed their work, and the farmer continued.

"No, I can't nowadays see time to go naow, but 'f ew cud wait till 'long in September I'd go 'f it bust my galluses. I allers did want tu go thar, an' 'f yew'll wait I'll go with yew, sure, after I get my wheat an' oats harvested. Besides, that'll be the best time t' go, as the dummed flies an' skeeters'll be all gone."

The latter sentence was uttered in such an insinuatingly persuasive way that it showed him to be earnestly desirous of partaking in the trip, and hopeful that it might be postponed till such time as he could get away.

Fortunately it mattered not to Scribe when he went, as he was making a holiday of that summer, anyway, preparatory to his permanent removal to California. And as he had taken a liking to the open face and hearty manner of his new acquaintance, they entered into the details of the September trip, and with words of mutual liking, parted, with the avowal that nothing less than sickness or other equally urgent cause would be allowed to interfere with their plans.

Summer sped away, and the middle of September was approaching. Scribe, mindful of his promise, dropped line to F., his former acquaintance, and received an enthusiastic reply, in which was offered conveyance for the trip in the shape of a pair of horses and a new double-seated "thoroughbrace" that he had recently purchased. He also recommended as members of the party, a brother-in-law of his named T., and a man who lived near Red Mountain, known as Black Rory, of the clan of McDonald, 'Ira the hiellans o' Scotlan', who was clearing a new farm for himself and his family out of the forest in that locality. He said that Rory was a good woodsman, and was better acquainted with that part of the country than any one else he knew of. This proved true in the end, and Rory was found invaluable to the party all through the trip.

Scribe hastened to the nearest railway town, and hired a conveyance to carry him to the farmers' home, together with the provisions for the trip, which he claimed the privilege of providing. He was met with hearty words of welcome, and was soon seated at the upper table discussing fried chicken, hot biscuit and the whitest of wild honey, with fresh butter and milk that would almost bring the dead to life.

The next morning, after a breakfast by candle light, the three men started, leaving F.'s two strapping boys looking after them with longing eyes.

"Naow boys," said their father, as he took up the reins for a start, "don't envy me my holiday. Yeu've had several on 'em this summer, an' I've had but one day, so 'f the 'I man is goin' to have a week out this time, jest be good-natured an' du yer work like men, an' it will be yer turn next."

"All right, dad," they said cheerfully, "we're glad you are going, but it makes us itch to go along with you and help pull out those big fish. We will keep things running all right while you are gone, and you need not hurry back. Good-by!"

"Good-by, boys! Glad to hear ye talk up manly like that," and with another wave of his hand to his good wife, who stood in the kitchen door waving her hand, he reins were tightened, and they were off.

"Teu good boys, them be, if I du say it, an' chips off the ol' block, teu. Like tu go fishin' jes' 's well 's I du, an'll work like tarnation all week so 's t' have a badaday aternoon tu go," he confidentially remarked as they drove off.

The weather had been very hot and dry for some time; the roads were dusty; the fields were parched; and the streams had dwindled far below their usual summer level. It was not a promising time for fishing, but it was now or never, and it "went as it lay."

The farm of Black Rory was reached that evening, and he was found expectant and ready, having been notified in time, and his strapping sonsy wife had a good, substantial meal on the table in short order. The night was spent in the hay of Rory's new barn, and all hands were early astir in the morning and on their way, as soon as a kettle of oatmeal porridge and milk was disposed of.

Rory's home had been carved out of the virgin wilderness, and was an outpost of civilization. To the northwest rose the dark fir-covered slopes of Red Mountain. To the east lay a great swamp, traversed from north to south by a winding boggy stream. Beyond this swamp, somewhere in the great untracked forest that then lay in unbroken miles to the east, lay the little lake that the party sought.

Some two years previously a lumber company, whose scene of operations lay many miles to the north, had brown a dam across the boggy stream some six miles north of Rory's, which had backed the water all over the great swamp, and had already killed nearly all the fir timber which had covered it. In the spring the floodgates would be opened at a time when the rush of the imprisoned waters would carry the saw logs way to the distant mills.

The stream was now at its natural level, so Rory reported, and upon it, about a mile away, was a boat owned by the lumbermen; that had been brought up from the dam and left in his care. This boat he had the

privilege of using, and they would take it and start out on a voyage of discovery.

Packing the duffle upon their shoulders, the four men started off, and soon plunged into the domain of the forest. Rory led the way, with Scribe at his heels, and the others following in Indian file. Scribe carried the only weapon of the party, a fine old Joe Manton double-barreled shotgun. The close season on grouse was not off yet, but the law of the forest grants the right to kill for immediate needs, and when a flock of those birds flew into the surrounding trees, soon after the party entered the woods, four of them were shot to provide a supper, in case the lake was not reached that night. These birds Scribe added to his burden, and before the boat was reached he was sorry that he had ever seen them. Rory said it was a mile from his place to where the boat lay, but on further questioning it proved that he meant that it was a mile from the boundaries of his land, which meant nearly two miles of forest travel, the last mile of which was through a tangled swamp of dead trees. The majority of FOREST AND STREAM readers will understand what this meant to four heavily laden men on a hot morning, with no foliage to screen them from the sun's rays, and not a breath of air stirring, in the portion of the journey through the swamp. Faces and bodies were bathed in perspiration; all exposed portions were covered with cuts and scratches; each and every one had been into the boggy ooze over his boottops, and every one had sat down several times and cooled off the broadest portion of his anatomy in the slimiest mud to be found.

Of such mishaps and experiences is made up the lot of the fisherman!

The boat, when found, was a heavy old tub, and was high and dry on the top of an old log; the only dry spot in the swamp. One might as well have gone to sea in a willow basket, so open were the seams. This necessitated a journey back to higher ground for spruce gum to fill the cracks. Three of the party did this, while the third pounded some dry cedar bark into fine fibres, and with this, by aid of a wedge of wood and a club, filled the worst of the cracks. When the gum arrived it was melted in an old oyster can which was in the boat, and after a couple of hours' labor the craft was ready to launch.

The job was pronounced good, as all hands could embark, and keep afloat, with only one man bailing at a time.

The stream which the party was now traversing was not a large one, but on account of the level surface of the swamp through which it flowed, was winding and devious. Here and there it widened into pools and good-sized ponds, and anon narrowed down to a few feet in width. Everywhere along its shores grew immense beds of pond lilies and other aquatic plants, and lurking in these at every turn and angle, lay what appeared to be small pickerel. Almost every stroke of the oars disturbed one or more of these fish, which would reveal his or their late presence by a swirl of water among the weeds. None of them appeared to be more than fourteen or fifteen inches in length, and Rory was applied to for information as to what they were, and as to whether there were any larger ones in the stream.

"I think that they hef not the time to crow pig," said he, "for it iss only since the tam wass puilt that they hef peen here, whatefer."

Which was probably the fact, as previous to the building of the dam, the stream was full of trout, and nothing else. Subsequent observation showed that the erection of that structure had backed the water clear up to the lake the party was searching for, and the pike (not pickerel) had escaped and bred freely in the stream; hence the numbers of small fish.

The boat proceeded up the stream for an hour or more, each inmate scanning the east bank closely for any appearance of a stream entering from that direction. Then false clues began to appear, and another hour was spent in investigation of them. Finally, after another hour of vain search, a spot was reached where clear water was certainly coming in under a bunch of dead willows. This was followed up, and found to be a small flowing stream, which Rory said must be the one they were in search of, and as he was the only one with any knowledge of the country, what he said had to go.

It looked like a hard proposition to tackle. The stream was small, being barely wide enough for the passage of the boat, and was crossed and recrossed with aged and sodden logs, and otherwise obstructed with a tangle of fallen treetops. Each bank was a puzzle of dead willows and firs, killed by the overflow, with the dead stiff branches reaching everywhere to clutch and tear the intruder in their domain.

The boat was entered upon this forbidding path, and pushed up to the first obstructing log. Here the party landed, and a plan of campaign was mapped out. Scribe was sent ahead with the camp kettle, the grouse, a few potatoes, onions, pork and seasoning, wherewith to make a stew on arriving at the lake, and have it ready for the tired and hungry beings that would follow later.

T. was to go ahead on the stream with the ax and clear away all the brush and trees possible, while F. and Rory undertook the task of getting the boat over the obstructing logs. To do this they had to unload and reload the boat many times, and were almost continually in the water and ooze of the swamp up to their waists, and often deeper.

As the burdened Scribe made his slow way through the heartbreaking tangle, he could hear his companions, for many minutes, splashing, grunting and "heave-ho-ing!" with an occasional forcible expletive interlarding the proceedings, by which he judged that they were having troubles of their own.

After an hour's hard travel the ground began to grow firmer, and deciduous trees to come in, with easier walking. Presently a break in the forest appeared, and in a few moments more Scribe emerged upon the bank of a beautiful little gem of the woods, which was winking back at the ardent glances of the sun and laughing a soft and rippling laugh from its

pebbly beach. The lake was pear-shaped; about two-thirds of a mile long and half as wide. It was an insignificant looking bit of water, to come so far in search of, with the expectation of catching large fish in its waters. As Scribe stood admiring the quiet beauty of the scene, his eye caught a movement on a little meadow at the extreme head of the lake, and there stood two large bucks at gaze, with antlers thrown back and muzzles advanced. They had evidently become aware that some stranger had invaded their domain and were trying to make out what manner of creature the intruder might be.

How beautiful and peaceful was the scene! No trace of man was anywhere to be discerned. No ugly stumps or fallen timber marked the steps of either camper or lumberman. All was as it came from the hand of nature. Scribe took it in with long soul-satisfying looks, and for a time forgot his toiling tired companions. Suddenly he came back to a realization of the needs of the hour and moved forward, and at once, like the shadow of a passing bird, the deer melted into the leafy shades and were gone.

Scribe moved up the north beach, looking for a good camping ground, and presently came upon an ideal spot, and within twenty paces of it he found a bubbling spring, that sent a tiny stream down to the lake. This was luck, and two crotched sticks were soon cut and driven in the ground, a cross stick laid upon them, on this was hung a hooked stick with a notch cut for the kettle bail. In this, with the bottom about eight inches from the ground, was hung the kettle, half full of sweet spring water. A comfortable fire of dry sticks was soon going, and the ingredients of the stew prepared. When all was going merrily, and the pot began to give forth a grateful smell, the rest of the party came in sight, and marked their advent with a lusty cry, "is dinner ready?"

They were a tired band, and were covered with the black mud of the swamp from feet to head. After a good wash and the removal of their outer garments, the stew was ready, and it was pronounced to be "the very best meal that ever was eaten," by all hands.

A satisfying meal, served just at the time that hungry men are ready for it, always calls for commendation of the food and the cook, and is gratifying all around.

After the dishes were washed (this was a clean party, and work was not neglected) all hands lay down for a good smoke and a well-earned rest, while their soaked nether garments were hung in the sun to dry.

The day was a hot one, as before mentioned, and after the hard work and the hearty meal, slumber soon stole upon the men, and the whole camp was asleep. Just about ten minutes after Scribe had closed his eyes, as it seemed to him, he was aroused by the voice of F. shouting, "Good nation, boys, wake up, wake up! Come, this will never do! We must git to work. It's near sundaown, an' camps to make yit!"

And surely enough, the day was waning fast, and the trees overhead were casting shadows upon the surface of the lake, as the balance of the group scrambled to their feet, and looked out with sleepy eyes over its face.

All was bustle for an hour, while boughs were cut and made into springy beds in the lee of an immense boulder, which some ancient glacier had borne and dropped here, miles away from its parent bed. A large piece of cotton sheeting, well soaked in strong alum water, had been provided for a tent, and this was stretched over the beds like a shanty tent, to protect against dew and rain. Abundance of dry wood was provided by Rory for cooking and campfires, while F. built a stone fire-place for cooking.

While the sun was yet a half hour high, F. ordered T. and Scribe to go out and make a try for some fish for supper; for by this time every one was hungry again, such is the tonic of forest air and exercise.

Scribe, nothing loath, jointed a stout ash trolling rod of his own make, attached thereto a heavy single-action reel, carrying some seventy yards of stout sea-grass line, and to the end of this a gaudy spoon and feather lure.

T. took the oars and off they started with high hopes. One hundred yards, 200 yards, 300 yards, and nothing doing! Then as they left the north shore and began to curve around the head of the lake, there was a fierce strike, and a fight was on.

But this was no pike that came tearing out of the water, shaking his head like a bulldog and turning summersaults in the air! This fellow's bronze sides gleamed in the rays of the setting sun like dull gold, and the silhouette of his great armed dorsal fin cut across the shining water as clearly as the horns of a new moon cuts the western sky.

Here was a "pike" with a vengeance. A sharp fight of fully fifteen minutes' duration ensued, with the angler as the victor, and a magnificent seven-pound bass lay captive in the boat.

Here was sport indeed! The spoon was again cast out, and within twenty feet of the boat was again seized, and after a similar fight, but with many more leaps into the air, a mate of the first fish lay alongside of him.

The spoon was again cast out for another bite, but it was some time in coming, and the boat was headed for camp. The hooks caught on a snag and T. was told to "back up." The order was obeyed, but the line kept slowly running off the reel. An idea occurred to Scribe, and he struck, and struck hard. Then there was "something doing" again, but it was all done under water, and by hard, sullen fighting. There was none of the picturesque leaps and rushes of the light-armored cruiser, but the slow, irresistible pull of the great battleship. As darkness settled down the fight ended by the capitulation of the fish, and a great pike weighing eighteen pounds was brought to gaff. Then went up to the skies some wild ululations, which brought F. and Rory to the water's edge to see the cause.

Surely three nobler fish were never captured in less time, and here was success, beyond the most vivid imagination in the party, and full justification for the uncertainties and fatigue of the trip.

AREFAR.

[TO BE CONCLUDED.]

To Elysium by Buckboard.

In Three Jaunts—Jaunt the First.

THIS is the veracious chronicle of a five hundred mile trip by buckboard into the Northern California wilderness far beyond the toot of the locomotive whistle, undertaken by a tenderfoot with one companion in search of health, game, and experience, and how they won all three. He has often since fared northward across those sun-baked red clay ridges, where the manzanita clusters thickest; through those live oak openings, sward carpeted like an old world baronial park, and into the cathedral calm of the pillared redwood forest, but the incidents of that first California outing are etched more deeply upon his memory than is the hunt of yesterday, and so he writes it.

The tenderfoot had been ill—not dangerously ill, but just sick enough to make him utterly miserable and uncomfortable, a nuisance to himself and a nuisance to those about him, although they were far too kind-hearted to admit it. His doctor insisted upon his remaining in bed, and all through the latter half of a distinctly hot June he lay there, kicking and thrashing, while his old hound Rondo now and again gave tongue from his kennel, as if to say: "Deer season opens July 15—get a move on you!" As visitors were not inhibited, they kept dropping in, singly and in pairs, with a hearty "Hello, old man, how are you making out?" and each with a story to tell of a projected deer hunt, while the sufferer grinned and grizzled. There was to be no deer hunting for him that season. Eheu! He raised the temperature of that room several degrees after each visit.

It was on the morning of the second of July that Bob's six feet of brawn and sinew projected itself into the sick room. He looked the patient over critically, half listening to his jeremiad. "See here, Marin," he said, "I don't think there is such a terrible lot the matter with you. You look more peaked and a trifle thinner than when I saw you last. You will never get well in here. Can you stand? Steady! That's the business! Where do you keep your clothes? In this closet? Now I tell you what I am going to do with you; I am going to dress you—studs on the bureau, you say?—and you are going down to sit on the porch, and to-morrow morning you and I will pull out of this oven and travel north where there is running water, big trees, fat bucks, and things. How would you like that, my hearty? Doctor will not let you go? We will see about that. There, now, you look as smart as a June bride."

Bob was a friend worth having. How he cast a hypnotic spell over that easy-going medico; by what good-humored railery he overcame the doubts and scruples of the invalid's family; how he packed the tent and camping kit down from the attic, cleaned and oiled rifle and shotgun, overhauled the fishing tackle, rolled the blankets and spare clothing in canvas bags, prepared a list of rations for two men for thirty days and saw that it was properly filled at the suburban grocery, need not be written here. When during that long busy day he found time to rig a hood of drilling over the front seat of the buckboard and have his horse rough-shod, is a mystery to the writer, but he did find time. At 6:30 o'clock the following morning the eyes of the early San Rafael commuter were greeted by the apparition of a very large and very bony sorrel horse drawing a well laden buckboard, while the "best hound in the county" acted as lookout from the top of the dunnage. Bob was helmsman and his course was northward.

The first three days were comparatively uneventful and the heat was appalling. The road ran through the vineyards and orchards of Marin and Sonoma counties; through fruitful valleys lush with ripening grain; past Petaluma, a Newark in embryo, where they spin silk and weave blankets, and where every hillside looks as though it had been sprayed with whitewash.

"Chickens," explained Bob. "A man named Dixon, who lives a few miles west of here, has ten thousand of them."

"Why are they all white?"

"I'm treed," said Bob.

Pretty soon the voyagers met a denizen of the valley who seemed conversationally inclined, and whose wealth of whisker begot confidence. "Pass him out that chicken proposition," whispered Bob. "Folks up here breed nothing but white chickens because the hawks, which are all-fired plenty hereabouts, cannot be hired to touch a white chicken," said the aged stranger; and he said it unblushingly. Perhaps it is true. At all events an Italian rancher near Cotati and a Dane on the outskirts of Santa Rosa gave the same explanation. "And neither of them knew English enough to lie scientifically," commented Bob.

Forty-two miles seemed far enough for the first day's journey—at least the old sorrel thought so, and said so, in horse talk. The buckboard's passengers needed no tent that night, nor indeed was that *sine qua non* of Eastern outings put into commission until many days later. Beneath a telegraph pole a few miles out of Mark West the camp was pitched, and soon the bacon was sizzling in the frying-pan, while the coffee brewed and "Goliath," for so the horse had been christened for the trip only, peacefully champed his ground barley. It was glorious, lying there snug in the blankets beneath the wagon, while the southwest trade wind, sobered by its 50-mile revel among the apricot groves and sunny vineyards, cooled one's temples and wafted the smoke of the two pipes in wreaths that shaped themselves in the moon's shimmer into wide branching oaks, beneath whose shade giant bucks seemed to browse and ruminate.

"I wonder what the 'coons and skunks think about those white chickens? I'll bet dollars to doughnuts that old Whiskers couldn't fool a coyote that way. Mr. Coyote has been too long in the poultry business for that. Now, a hawk might be educated into the belief that those gobs of whiteness drifting across the landscape were just ghosts—chicken ghosts, of course; but a coyote is as materialistic as a Chinaman or a Harvard professor, and he would first devour the fowl and then, if so minded, speculate on its wherefor, post-prandially, when he felt strong and hearty"—here Bob's lugubrations were interrupted by the advent of a tramp, who wanted whisky, but compromised on a pannikin of claret.

"Gen'men," he said, when the last drop of claret had disappeared, "I know I don't look it, but I'm a worker,

I am. I've the promise of a job now from my old boss. He's up at Crescent City with the show. Ever hear of Sprigg's Circus? No? Well, he's him. He's goin' to show plumb up the Coast to Puget Sound. No, siree, no California in his'n. It was this way. Four months ago the old man would have it that there was bushels of rhino to be made showin' 'tro' them durned mountings an' gulches nort' of here. Said them mounting people an' buckeroos an' sech ain't ever see a show. Said they'd tumble a top o' themselves to get into it. Said as how, w'en we struck the fruit belt, them dagos an' Eytalians an' Swedes, an' Swiss, wid seventeen kids in the family, would come a-whoopin' an' a-pilin' inter that old circus fit ter split the tent.

"Well, gen'men, we started. Bizness was bum, an' it kep' gittin' bummer an' bummer. Along about Yreka we showed to thirteen white men, t'ree Injuns and a Chink, an' the old man had to leave the African lion in soak. But Sprigg's nerve was all O. K., you bet! Say, if you'd catch an' bottle the old man's nerve, you'd run all the injines in Nort' America wid it. He kep' right along tellin' us geezers t'ings would get better, w'en a blin' man couldn't help noticin' that they was pizen bad an' graderly gittin' so dam pestiferous bad that grub for us-selves, widout mentionin' the an'mals, kep' all hands on the hustle all the time. We was showin' 'tro' them little flyspeck towns up in Del Norte, w're five's a crowd an' fourteen's a riot, an' was workin' sout', sheddin' an'mals an' cour'osities at every pint. At Cottage Grove a jestic levied 'tachment on the hosses; but the old man compromised on the brindled gnu, a cage of snakes, an' the twin armadillers. That's w'en I lost most of my teeth. At Acorn they grabbed four of the hosses for keeps; at Yager, more hosses; at Blocksburg t'ree cages of an'mals, an' jugged six of the boys for chicken stealin'. Calkerlate they t'ought we could live on wind, same as snakes!

"Round Valley finished the bizness, for a fac'. Them buckeroos swooped in an' cleaned us out. Took the tent. Took the Sacred Ox of the Braymins, w'ich them unt-tooted chil'ren of nater worship as their God, an' ackerly barbecued him—that's w'at them gazababs done! I eat a chunk of him, too, an' he was tuffer'n fracazood boot-heels wid the brads left in. This was the wind-up. Some of the boys stayed in the valley; some shinned out for the Coast. I went to work cuttin' tanbark till I made a stake an' then I made tracks for 'Frisco. But the old man was there ahead of me. Stumped w'en the show busted? No, siree; that ain't his sort. He had an' old plug of a camel that none of the creditors wouldn't have, 'cause as he'd eat more'n five hosses, an' the las' I seen of Spriggs he was a-deck of that camel wid its nose pinte sout'—that is till I see him in 'Frisco. Say, he lived high. I'm tellin' yer. Let on to them jay countrymen that he was an Arab chief a-travelin' to the Paris Exposish, an' was takin' a short cut 'cross lots! They stuffed him full'n a p'lecman of venison, hog meat, an' saleratus biscuit, an' buzzed him about his 'country'—an' him a-born in Stamford, Connecticut!

"At Ukiah, w're the railroad from 'Frisco got tired an' quit, he put up at the Gran' Hotel, an' the camel at Miller's livery stable. He was a-figgerin' how he'd make a raise to jump the town, w'en along come old Bob White who owns most everything up around Cahto, an' he took a shine to Spriggs an' passed him twenty; an' the old man wcp' on his neck an' guv him the camel! He did, for a fac'. Well, gen'men, w'en the old man struck 'Frisco there was nothin' doin', an' his brother up Seattle writ him sayin' as how if he could work his way up there they could get trusted for an outfit. Nothin' for it! They passed the old man over the railroad's far as Ukiah, but he couldn't hang up them Oregon stage roosters no how! Along come old Bob White again. 'Wat are you a-doin' here?' said he. 'I'm stuck,' said Spriggs; 'if I only had a hoss I'd make State Line all hunky, an' soon as I strike Oregon I've plenty friends,' said he. 'I'll fix yer,' said White. 'I've plenty fine hosses up to my ranche. Take this letter up there to my son Jim—it's only sixty miles from here—an' he'll give you a mount all right.'

"Gen'men, the old man took it, an' may I be hornswig-gled if Jim didn't trot out that dadblasted old whangeree of a camel! Here's yer Buccfeelus, you bald-headed old fakir! said he; 'an if you don't ride him off this ranch in t'ree shakes of a bull's tail, I'll sic them dogs on the pair of yer.' Gen'men, the old man done it. He rid that camel into Seattle. Got any tabaker?"

Breakfast by lantern-light and a start at the first glimpse of dawn brought the wayfarers into Healdsburg in the early forenoon, and just outside this thriving village Bob shot a coyote slinking along the chemisal. It was a rattling good shot, too—200 yards uphill, with a .22 caliber short cartridge. The hotel cooking tasted pretty good for a change, and a glass of beer brewed by an old German, who had never learned the modern art of sophistication, and whose whole brewery could be stowed away and lost in a corner of one room of a metropolitan establishment, was a treat often to be mentioned when the travelers were far beyond the beer belt. Better hops are grown in this valley than in Bavaria, which possibly contributed not a little to the excellence of this rural brew.

Pieta, famed for its brawling brook, no less than for the gamy trout that lurk therein, was reached two hours before nightfall, and there, poised on a rock in mid stream, stood an Indian, fish spear in hand! While Bob unhitched Goliath, Marin whipped the stream with royal-coachman, black-gnat, brown-hackle—it made no difference what, the trout responded to every lure. Ah, me! Those were halcyon days, "consule Planco," brethren of the angle!

But look! The Indian strikes! His naked, sinewy arm shoots downward and the thong about his wrist tightens. He lifts his spear, and there, transfixed upon its single barb, writhes a two-pounder! Pieta Creek still holds a few such whales, but he who would win the fellow of that Indian's catch nowadays must be sound of wind and limb, and wary to boot; for, verily, in these days of general education, the trout, too, have had their schooling. The big fellows seem to have been through college and started on a post-graduate course!

"How many you catch?" inquired Bob of the Indian, in that peculiar baby-talk in which many of us clothe our thoughts when we address people whose tongue is not our own. He had nine—all of about the same size. After dinner a stroll around a spur of the foothill revealed his

shack, himself smoking in the doorway, while his brood of youngsters, not too liberally clad in clouts and gunny-sacks, squabbled with two wolfish dogs in the dust at his feet. Had he any baskets? He smiled, superciliously, it seemed. Pshaw! What had a brave to do with baskets? They are women's work. "Give old Muck-a-muck another shake out of the box," Bob suggested. A handful of tobacco purchased his attention. He called his squaw in his own language, Pomo. Now, the Pomos, as a people, would never capture a prize in a competitive beauty contest, but of all the Pomos that have fattened on scrambled grasshoppers since the original pair left their primeval home, somewhere in the Japanese archipelago, no doubt, and stranded on California, there never was a more hideous old Pomo than that Pieta squaw! But her baskets! The veritable "bam-tush" and of the finest weave! The Eastern public were not educated on the subject of Indian baskets in those days. To-day aniline dyes and patterns designed by house decorators and woven to order have well nigh destroyed the Indian's unique art; but when such baskets are unearthed nowadays, the fortunate collector marks the day with a white stone, and gladly pays for his prize its weight in double eagles. The buckboarders that night got three such baskets for a single five-dollar gold piece.

"We're getting into God's country," said Bob, next morning, as he contemplated with satisfaction unalloyed the rockgirt gorge, where, far below, Russian River writhes and twines, like a wounded snake. "The air is different up here, and the people, too, are different. See that scrawny little foothill ranch 'cross the canyon. I bet you a Missourian lives there. How do I know? Well, this mountain country was peopled originally by two emigrations—one from old Pike, the other from up Lake Champlain way. All the Pikers built their houses broad-side-on, with a porch running the full length of the house. The Champlainers built theirs end-on, with a cubby-hole of a porch in front, just as they did back East. The valley people down yonder turn up their noses at these mountain folk and their 50 by 100 potato patches. They say they're shiftless, lawless, worthless. Don't you believe it. There's a higher sense of honor, a nobler recognition of the rights of his fellow men and a more correct conception of his own rights, a more genuine respect for those elemental principles of eternal truth upon which all man-made laws are grounded, or ought to be; a fuller hospitality, and more old-time American patriotism stowed away in the carcass of one of these husky old mountaineers than you could discover with a microscope if you dissected a town full of those hyphenated Americans who raise fruit four months in the year and hades 'tween seasons. Handy with the trigger? Yes, sir, when the quarrel's a just one. Here's where Uncle Sam will have to come when he needs men, and he will not have to round them up, either. Hark! Those hounds are running something. Bet it's a deer!"

The buckboard was checked on the verge of a sheer descent, where the road winds in and out among a scant growth of manzanita, and directly ahead, in the shadow of a Valparaiso oak, stood a gaunt figure in a 'coon skin cap, with a long barreled rifle resting lightly in the crook of his arm. He stood as motionless as if carved in granite, his eyes fixed on the road before him—the embodiment of an Idea—dead past resurrection—one of the scattered few still carried on that muster roll that reaches through the centuries, linking Plymouth Rock to Oklahoma—an American backwoodsman! Uncover to this man, ye children, native to the soil, who buzz and whirl in city hives! Have ye plenty? His unrequited toil bestowed it. Have ye peace? He made that peace—made it, gun in hand, as peace with honor ever has been and ever must be won, in many a French and Indian raid in old Colonial days; in the trenches at Lexington; behind the sand bags and cotton bales with Jackson at New Orleans; in the Everglades of Florida and the canebrakes of Alabama; amid the muck of blood and sweat and cannon smoke and dying men upon the glacies at Chapultepec; throughout those long, drear days of Civil War; again when the lava beds yielded their meed of fawning devils and Canby's foul murder was avenged; when Sitting Bull surrendered and when old Geronimo's band of cutthroats sulkily stacked their arms in the parade ground at San Carlos. Have ye great cities? His ax cleared their sites; his unerring rifle guarded them in their infancy; his untutored brain framed their earliest laws and framed them wisely. Have ye liberty—God's supreme gift to man? With his life blood he bought it—a heritage for you and for your children's children forever.

Such were Marin's thoughts as he gazed at the old frontiersman, dimly conscious the while that the hounds were drawing nearer. A violent wrench, as Rondo, heedless of chain, somersaulted from the buckboard, admonished him that something was about to happen. It happened. A noble four-pointer sprang into the road and for an instant stood there, with quivering flank and foam-flecked chops, but for an instant only. Up went that long Kentucky rifle, a cr-ack, the thud of a round ball impacting on taut hide—and the deer lay dead in the dust, with his four feet stretched to the cardinal points.

"Howdy, boys!" said the old man, as he swabbed out the gun with its brass-mounted cleaning rod.

"Broke his neck?" queried Bob.

"I calc'lated to break it. That's a fine hound you've got thar. Trained on varmint?"

"No, on deer."

"Pity! Thar's the makin' of a right sassy bear dog in him."

"That is a beautiful weapon of yours; may I examine it?" It was Marin who spoke. Proudly, reverently, and without a word, as a young mother passes her first born over for inspection, the old hunter handed Marin the rifle. Beautiful was it in very truth, from the buhl-work of its highly polished walnut stock, with a cheek-piece and a cunningly wrought patch box in the butt-plate to the hand-carved hammer, lock-plate and trigger-guard, along five feet of Damascus barrel half octagon and coffee-brown, clear to the inch-long Rocky Mountain fore sight, added, no doubt, by its present owner. How Marin yearned to call that noble relic his; how base covetousness kept gibbering words, not to be spoken, in his ears; how cold calculation took inventory of the hunter's years, his probable necessities, and weighed them against the gold that quaint old Bernal Diaz says "all men love so well," should not be written here. It was

sordid, low, brutal, shameful. That rifle was handed back to its rightful owner and the hateful question was never uttered.

"That's right," said the backwoodsman. "She was originally a flintlock. Made in Kentucky in '31. Father had her altered to percussion. He carried her all through Black Hawk's war. If you boys want a deer hunt, you're welcome up thar to my cabin to stay just as long as you've a mind to. Season's not open? That makes nary difference. Nobody'll bother you, I reckon, up here with me. Law don't permit no shootin' out of season? Wall, I've just got to lay in my supply of jerked venison, and season or no season, I don't let nary deer bite me."

The summit of the ridge was reached, and in a saucer-shaped valley, girt with mountains on every side, lay the little city of Ukiah, the frontier of the unknown wilderness beyond—unknown at least to the voyagers. Here Marin made his confession to his companion.

"And you were ready to pay that old pot-hunter one hundred dollars for his rifle? Why in thunder didn't you offer it to him, then?" inquired Bob of the practical mind.

"Because, my dear fellow, I was afraid he needed the money and hence would accept my offer and regret it to his dying day. There are some things in this world, Bob, that cannot be bought or sold. You would not ask the Hindoo priest to sell his idol, and if you did succeed in inducing him to commit this, to him, unspeakable sacrilege, wouldn't he bemoan it and wouldn't you feel that you had done a shabby—and I'm not so sure—but a wicked action?"

"You're right, Marin. Anyone could see with half an eye that the old man just adored that gun. Well, here's Ukiah. Let us put up at the Grand. That camel yarn has been sloshing 'round inside me and I must investigate or burst."

MARIN.

(TO BE CONTINUED.)

Notes of Trail and Camp.

Swimming a Horse.

MR. HOUGH, the other day, had something to say about the swimming power of a horse. Were a man to tell me that the average horse could not swim with a man on his back, I should only laugh at him. I have had too many of them swim with me on their backs.

I rode cavalry horses for twenty years and sometimes had the same horse for four or five years; but I never had one which could not swim and carry me on his back. I have often undressed; then mounting my horse bareback, swam him for fifteen minutes at a time. I rode one horse for four years that I would not hesitate to swim the Mississippi with. He was a slender, long-legged sorrel and a fast one, too. I ran him against some of the fastest horses the cowboys could scare up, and he beat them all.

But I would never ask a horse to swim with his saddle on and then carry me. In that case I would swim behind him, holding on to his tail. I have seen men swim clinging to the horse's mane. That is a poor place. There is always a danger of the horse hitting the man with his forefeet; he cannot hit you with his hind feet if you swim holding on to his tail.

In the summer of 1884 I was down on the Sabanal River, Tex., just where the railroad crosses it. The river was bank full after a heavy rain, and the current ran like a mill race. There was a cattle ranch on our side, but none on the other for a good many miles; and a stage coach full of passengers was water bound over there, and they were hungry. The men at the ranch wanted to send them something to eat, but said that none of their horses could swim in that current.

"I have one that can," I told them. "Get your ropes ready."

They got a long coil of half-inch rope, and cutting it in the middle, we had two that would reach across. Then taking my horse I went to the river, stripped to my undershirt and drawers, and tying an end of each rope around my waist, got my horse in the water, and using only his head stall and halter strap, no bridle, swam across, and the ropes were stretched and a basket hauled across. I was then ready to go back, but twoadies in the coach tried to stop me; they were afraid "that my nice horse would be drowned." They did not seem to care whether I was or not. I got the horse in the water again, then wrapping his tail around my left hand told him to "go ahead, Charley." I had never used a whip on him; he did not need it. He swam with the current, and went 200 yards down stream before landing, then climbed out, none the worse for his trip.

In swimming a horse, if on his back, I would sit as far back as possible. Use no bridle, but only the halter; let the horse have his head and never hurry him.

Tins for Bread Baking.

A short time since I got a letter from one of a party of young men who go on a trip each for a month or more and generally go by water, using canoes and small skiffs. They often get so far away from any settlement that they cannot get bread to buy, so they carry their flour and bake it themselves, and the metal ovens they had were too heavy and too much in the road. Did I know of a better plan to do the baking? I did, and told them what it was: I would not carry a Dutch oven anywhere now, unless I had a wagon, and then would only use it to roast meat in.

I told them to get sheet iron mess pans; they can be got in any large city; the army uses them. These are about 14 inches in diameter at the top and less at the bottom, the sides flare, and are about 6 inches deep. Now cut off a strip 2 inches wide around the top of one pan; then put the dough in this one and use the one not cut to cover with; it fits close and will keep out all dirt and ashes.

Use them in baking just the same as a Dutch oven is used, only there need not be so much fire used with the pans; they bake in half the time an oven does, but

must be watched to prevent the bread burning. It is better to mould the dough in the shape of biscuits, but loaves can be baked in the pans if they are wanted.

These pans are just the thing to carry in a small boat; after being nested together, the tin plates, knives, forks and tin cups can be put in them, and the whole affair takes up but little room under a seat. In camp the small pan can be used as a frying pan, a split stick doing duty as a handle, while the pan that has not been cut does very well for a cooking pot.

I have baked as good bread in these pans as any man need want to eat, and enough of them to bake for 50 men can be nested in each other, then thrown in a gummy sack and tied on top of a mule's pack; they will not weigh more than an oven lid would, and cannot get broken.

Another trouble my friends had was that they could not always get good bread, though they were using the only good baking powder that is made (this is the maker's opinion of it, not mine). I told them, if they used this powder, to put in one-fourth more of it than the directions call for, or if they used another that is just as good, but don't cost 40 cents a pound, to use still a little more of this one; then put the powder in the flour and mix up both well while still dry; then melt lard or grease in hot water and use this to mix the dough. Never use cold water about it. Then work the dough well and the bread won't be heavy.

CABIA BLANCO.

Natural History.

The Extinct Mink from the Maine Shell Heaps.

By the politeness of the National Museum I have a leaflet entitled "Description of an extinct Mink from the Shell-heaps of the Maine Coast," the introduction to which is as follows:

"Upon the shores and islands of Penobscot Bay and the adjacent coast there exist numerous shell-heaps, the majority of which were made by Indians. They vary greatly in size, some being an acre in extent, while others cover but a few square yards. The age of these shell-heaps is unknown, but from the absence of metals and articles of European manufacture from many of them, it is allowable to suppose that they date back at least to pre-Columbian times. This idea is strengthened by the discovery in one of them of the fragment of the skull of a mink, representing an extinct species which appears to be new, and is described for the first time. Remains of other extinct animals will doubtless be detected as our knowledge of these shell-heaps increases."

Some seventy-five years ago, and for many years thereafter, my father, who was a fur-buyer, used to have nearly all the furs taken on the islands of Penobscot Bay, from the mouth of the Penobscot eastward to Frenchman's Bay. Many of the mink, especially from Swan's Island and Marshall's Island, were fully twice as large as the mink from inland, the smallest of them being as large as the largest inland mink and the largest fully twice the size of their inland relatives. I remember frequently hearing them spoken of as being "as large as small cats." Later I saw and handled many of these mink. Their fur was much coarser and was of a more reddish color than that of the inland, or as they were then called, the "woods mink," to distinguish them from the "sea mink." These sea mink were usually extremely fat, and the skins had an entirely different smell from that of the woods mink. I could with my eyes shut pick them out from the woods mink by their peculiar smell. In the old days, when mink were judged by size instead of by fineness and color, as was done later, these sea mink used to bring considerably more than others on account of their great size. On this account they were persistently hunted. Yet scarcely any were trapped on the islands. Instead they were shot or hunted with dogs trained for the purpose. As the price of mink rose, they were hunted more and grew scarcer, till in the sixties, when mink skins brought eight or ten dollars apiece, parties who made a business of hunting nearly or quite exterminated the race. Some of these men went from island to island, hunting any small ledge where a mink could live. They carried their dogs with them, and, besides guns, shovels, pick-axes and crow-bars, took a good supply of pepper and brimstone. If they took refuge in holes or cracks of the ledges, they were usually dislodged by working with shovels and crow-bars, and the dogs caught them when they came out. If they were in crevices of the rocks where they could not be got at and their eyes could be seen to shine, they were shot and pulled out by means of an iron rod with a screw at the end. If they could not be seen, they were usually driven out by firing in charges of pepper. If this failed, then they were smoked with brimstone, in which case they either came out or were suffocated in their holes. Thus in a short time they were nearly or quite exterminated.

My opinion is that the so-called new mink is nothing more nor less than the skull of one of these large sea mink. I think so because, having handled at a very low estimate at least 50,000 mink skins taken in Maine and the Provinces, besides skins from most of the States and Territories, I have never seen any as large as those mink used to be. I have handled very large mink from Minnesota, the Red River of the North and Fraser's River, but some of the sea mink were larger than any of these.

We have in Maine and the Provinces quite a number of varieties of mink which are very local, living within restricted limits and being found elsewhere only as stragglers. While for the larger part the mink of Maine, New Brunswick and Nova Scotia are nearly alike in general size and color, we get some which differ so in size, color, or fineness, than an expert can tell at once where they were taken. From Baedec and Bras d'Or we get a large, fine, dark mink which commands

the highest price. From the Baie de Chaleurs the mink are not above medium size and the under fur is very light colored, reminding one of the so-called "cotton mink" of Kentucky. From the north side of the Mirimichi Bay we get a medium-sized mink with very soft fur of a brownish shade, which, when the usual New Brunswick skins brought six dollars each, sold for a dollar less apiece on account of color. From the large lakes on the head of both branches of the St. Croix we get a very large mink of good color and fur, being the largest of any inland mink taken in Maine that I have ever seen. Why they should be larger than those taken on Mooshead and the large lakes of Upper Allegash is a puzzle, but such is the fact. North of Mooshead are the little black mink not over two-thirds the size of average mink. They are the darkest mink taken in Maine, and seem to care less for water than most mink, as they are often found a long distance from it. I have never seen one of these mink from any place except the region north of Mooshead Lake.

I might mention several other well-marked geographical races. In all those I have mentioned the variety is confined to a quite limited territory, and they differ each from each more than do the geographical races of horned larks, ruffed grouse and other birds markedly affected by environment. I can count up over twenty well-marked varieties of mink which I have seen from various parts of the United States and Canada, and I feel sure that there are a great many more as well entitled to recognition as any of the races of birds, if they were separated, as the birds are, by size and color.

The mink which are now taken on our sea-coast along Penobscot Bay are quite large and the fur is coarse, but we get none of the great sea mink like those taken forty or more years ago.

We also used to have a very large otter on the same coast as the sea mink. I used to see scores of them brought in when I was a boy, but after I took my father's place in the fur business early in the sixties I bought but few, and for thirty years I have not seen one. I have bought some of these seashore otter which were at least one-fourth larger than any land otter I ever saw, and I have handled many thousands of otter skins.

Referring to the statement that "remains of other extinct species of animals will doubtless be detected as our knowledge of these shell-heaps increases," I would say that the shell-heaps of Maine have been pretty thoroughly examined. Many of them have been dug over and over again, each one thinking that he was the first. As early as 1878, while digging in a shell-heap on Great Deer Isle, I had the pleasure of unearthing near the very bottom of the heap part of a clay pipe marked T. D. I think the great majority of the shell-heaps of any size on our coast and islands have been dug over. In 1878 I sent to Prof. F. W. Putnam, of the Peabody Museum, Cambridge, Mass., with some Indian skulls and bones, pottery and other relics, a lot of the teeth of moose and beaver and the jaws or parts of the jaws of deer, bear, fisher and mink. These were examined and reported upon by one of the Harvard professors, but no mention was made of any of them being different from the common forms. I have several times found remains of the great hooded seal or "hooked seal," as it used to be called, on our coast, and the teeth of seal are quite common in shell-heaps. One singular fact is that while shells of very large oysters can be found in countless thousands near Damariscotta, I have never in my digging, in many places, from Camden to beyond Mount Desert, found a single oyster shell and but one shell of the quahog. Yet fifty years ago an old inhabitant of Mount Desert told me that when he was a boy quahogs were found near Indian Point at West Eden.

MANLY HARDY.

BREWSTER, Maine.

Man and the Brute.

WHILE conceding the probable truth of much of Mr. Hallock's recent interesting paper entitled as above, I feel that sundry of his contentions are open to question. I cannot, for instance, admit that animals study causes and consequences, or that they deliberate in the true sense of the term, that is, revolve in their brutish minds matters pro and con to the issue, to then strike a balance in their final decision. I am persuaded that such mental operations imply a higher reasoning faculty than animals possess, but space admits of but a limited discussion of this particular subject.

Animals undoubtedly have a limited vocabulary, but that "words, or the number used, are not the measure of intelligence, brute or human," as Mr. Hallock contends, appears to me a rank heresy. Words are the implements of thought, without them complex mental processes are impossible; in short, as Max Muller declares, "thought is identical with language." In animals language appears to be an observation or interpretation of movements or sounds, and their actions may be said to be guided, as a rule, by habit, inherited or acquired. Except in instantaneous action, as a boxer in sparring, a man usually formulates his intention to some extent, in words: the boxer, of course, has no time to think, and like the animal, depends upon the operation of habit. The boxer, in recalling his performance, conjures up a vivid picture of his own and his opponent's action, and, similarly, the memory tablet of the animal is probably occupied by a series of pictures, unconnected with causes or effects, a consideration of which, in my view, does not enter the animal mind.

It is not to be denied that animals have imagination of a certain kind, but the faculty is the operation of a memory very retentive of minutiae. The savage may give us some insight into the animal mind. Like it, it is occupied with trifling details, but it is to be assumed that with the brute, such absorption occurs in far greater degree. Denham, in his Travels in Central Africa, speaks of a savage of exceptional intelligence, who, though capable of recognizing representa-

tions of human figures, could not understand a landscape, and such instance of mental incapacity invites a discussion of the memory of the horse. I believe that the wonderful memory of locality that is possessed by this animal is based upon a study of minor, and what would appear to us, inconsequential features of the landscape. Unlike a man, the horse probably does not take in its broader aspects its relation to other landscapes, it has no knowledge of north as opposed to south, or east to west. All this involves comparison and thought, which, without language, would be impracticable. Over and over again, when on horseback, I have ridden my mount by a strange road to a familiar place, and as the animal approached it, I strove to learn what it was that inspired his obvious recognition. My efforts were unsatisfactory, but notwithstanding, I am inclined to the opinion that the identifying features are seldom such as would impress themselves upon the memory of an intelligent human being.

In its primitive state the horse probably roamed vast, and to human eyes, monotonous plains, guided by a memory retentive of detail, and scored by a close study of the minutiae of a substantially featureless landscape. The horse, like the dog, should be able to conjure up from the store house of its memory a wealth of visual objects, together with actions immediately associated therewith, and to this extent it may be said to have imagination. I have little doubt that in this particular, the horse and various other roving animals have memories equal to or even superior to the best among men. That is, no man, though of exceptional memory and intelligence, could observe and remember such a variety and number of minutiae as the horse or dog stores up in its brain. This close observation and memory of detail has been observed in Indians and various other savages, but how much more must the faculty be developed in animals?

As a further illustration of the limitations of the savage mind, it may be mentioned that the Kaffir has at first great difficulty in understanding drawings, and it is related of a band of Australians that upon being shown a well-drawn and colored picture of one of their own race, found it incomprehensible, one declaring it to be a ship, another a kangaroo, not one of the dozen observers recognizing the portrait as having a connection with himself or his kin. To give them an idea of a man, a rude drawing is necessary, with the head much exaggerated, after the fashion of a little child's slate pencil sketches. I never heard of an authentic instance of a dog recognizing the portrait of its master, or of one of its own kind. The attainment of an understanding of the projection of a human upon an absolutely flat surface requires education, and while I believe that dogs and possibly cats have occasionally been moved to active demonstrations by their reflections from mirrors, I have never myself observed it and believe it to be of very rare occurrence. It is very likely, however, that the animals' minuteness of observations usually enables it to detect the illusion.

I subscribe unreservedly to Mr. Hallock's expression of a belief in a super-sense in animals, a perception of remote and unseen localities to which they bind their course in a straight line. Can any one reasonably assume that the wandering albatross that circumnavigates the globe, is without a distinct perception of the lone little island in the South Pacific that forms its breeding place? Wilson's petrel annually voyages from the South to the North Atlantic, returning to Kerguelen Island, probably ten thousand miles from its furthest northern attainment. The seals of the Prybylov Islands, over which there has been so much contention, voyage annually in an ellipse covering six or seven thousand miles, projecting their course with unerring certainty—even though the locality be shrouded in the densest fog. Prybylov, the discoverer of these islands, strove for years to find them, and though possessing every appliance of navigation, his effort availed him naught until the roaring of the assembled herd penetrated the thick mist that had so long been their protection. Such instances of occult animal perception could be indefinitely multiplied, and in explanation the writer has to say that every locality may have its distinctive series of radiations. When we view a landscape there are light emanations projected to our eyes from every point, and to the peculiar perceptions of some animals there may be local emanations of a different character, of which we are not cognizant. Not only radium, but a number of other substances are more or less radio-active, even water from deep wells has been found to be so. Moreover, this theory is in accord with some late speculations as to the constitution of matter, which are to the effect that all its forms are simply varieties of motion in the ether, and that all such motions are indefinitely propagated through that mysterious fluid. I believe, however, that the faculty of keeping in constant touch with a desired locality is only exceptionally possessed by dogs, horses, and other animals, but that fishes and far roving birds are so endowed, I feel certain. The swordfish and the tunny voyage to our coast annually from the Mediterranean. Whales undoubtedly roam thousands of miles, and fish generally probably wander as much as birds.

Not only do I maintain that many animals have a perception of remote and unseen objects, but also of each other, and of each other's mental states. When each member of a vast shoal of herring floating upon the ocean's surface simultaneously flicks its tail and disappears beneath the surface, the community of action necessarily implies an instantaneous transmission of the impulse, and the same may be said of the aerial evolutions of immense flocks of birds. It may be said as a possible explanation that every thought or impulse emanating from the human or animal brain is the result of distinctive motions of infinitesimal portions of its substance, and that these motions may be translated through the ethereal medium, of which they form a part.

Does Mr. Hallock, in his suggestion that animals may enjoy an after life, consider all that it implies? Shall beast continue to subsist upon beast? Is the world to come to be one of ravine and slaughter? And if so, what is that world into which death enters,

to what else is it a prelude? For myself, I do not believe that an animal can project itself into even its mundane future. I hold that the morrow never enters its consciousness, that it has no anticipatory joys or fears. A dog, upon observing evidences of an impending outing, may be transported with delight, but his emotion is stirred by visible and well recognized preliminaries. That he ever of himself contemplates such outings, or that, like ourselves, he lives in dread or inpleasurable anticipation I do not believe, nor that the memory of suffering or of gratification in the past survives to depress or cheer. This oblivion of the past and future is the secret of the animal's contentment, and in this respect his lot is to be envied. That the bee does not store up its honey with a consciousness of the advantage to be derived has been demonstrated, and like the bee the animals cannot confront an exigency unknown in their experience, their mental equipment suffices to maintain their species and it, therefore, possesses not that of which it has no need.

Permit me to say a few words in reply to Hermit's further advocacy of his contention that with animals' parental instruction largely takes the place of inherited instinct in fitting their offspring for the battle of life. A kitten of proper stock will easily kill a rat of nearly its own size, and the nipping of the cervical vertebrae of its victim may be wholly untaught. Is its feat more remarkable than the inherited tendency of a bulldog to pin a large animal by the nose, or of a ferret to bite the cerebellum? Some species of wasps paralyze their prey by stinging it in certain motor centers, and the insect thus disabled affords a store of sustenance for the wasp's growing offspring that slowly devour the crippled creature, and thus the juvenile wasp, though abandoned by its parents, thrives for weeks upon the living provender that is furnished. When, in turn, it becomes mature, it seeks the particular insect that its species affects. A spider is given a single sting in the central ganglion, a cricket is pierced in three different nerve centers, and will live in a comatose condition six weeks or more; the great Texas spider surviving in such state much longer. Caterpillars are punctured in eight or nine places, and the head is also partially crushed. In all these instances an inherited memory is undoubtedly the spring of action. Yet with the cat Hermit would probably maintain that it officiates at a sort of feline kindergarten, grounding its brood in the rudiments of their future activities, and that without such impartment of parental knowledge the neglected offspring would perish by reason of their ignorance or inaptness. I deny that animals, as a rule, possess intelligence or reasoning power, because such acquirement is not necessary to sustain them in their struggle for existence. Nature furnished them with an equipment just sufficient to maintain their species; with that accomplishment evolution ceases, for the selective causes no longer exist. No species of animal depends upon intelligence in its contention with others; there appear to be no factors tending to evolve a reasoning faculty; ergo, it is absent. To my mind, Hermit's illustrations upon this subject carry no more conviction than does his recent deduction concerning the position of a cat's ear, which he contends signifies no when flattened and yes when erect or pointed forward. Now a cat, like a horse or dog, will retract its auricular appendages when fighting, for such projecting portions of its anatomy are readily exposed to bites, hence a retracted ear, with various animals, is an indubitable sign of displeasure, real or affected. In horned animals this expression is absent, for they do not bite in their contests. An animal that will invent signs for yes and no will not stop at that accomplishment; upon such signs must necessarily hinge others, and I think that if Hermit had fully studied out his cat's presumptive vocabulary he would have had material for a dictionary of substantial proportions, and thereby enabled people to express themselves felinely, so to speak.

A. H. GOURAUD.

BROOKLYN.

A Snake and His Meal.

VANCOUVER, B. C., July 9.—*Editor Forest and Stream:* I inclose a photograph which may be of interest to the readers of your natural history column.

While walking along the beach near here with two companions, we came across the snake crawling over the sand. We started to tease him with a small stick,

SNAKE AND FISH.

which appeared to make him very angry. During the game we scratched him down the back with the stick, upon which he disgorged the fish seen in the foreground of the picture. We measured the fish, which was 5½ inches long, and then the snake, which was 20 inches long, took his photograph and let him go to hunt another meal.

The snake was a common one along our rocky shores, black, with gray markings.

Being a circumstance which one does not witness every day, I thought it worthy of record.

H. G. BREEZE.

The Horse Came Back.

A HORSE belonging to A. M. Locke, of this city, freed himself last night from the stables of the late Rev. Solomon Clark, in Plainfield, and was found in his stall at the Smith Car bakery's stables this morning. Mr. Locke was much surprised to find his homesick horse waiting for him upon his arrival at the office this morning, and, though the animal is quite human in nature, yet he did not convey any intelligible signs as to the circumstances under which he was present. Mr. Locke then telephoned to Plainfield to determine whether his sons, Owen and Walter, who arrived at Plainfield Sunday afternoon for a vacation, were aware of the horse's departure. But the boys were sound asleep and not guilty of the whereabouts of their good beast. Later investigation showed Mr. Locke that the horse freed himself during the night, returning to his home in this city, a distance of twenty miles, and never having traveled over the road but once before. The horse was in good condition, unheated and without a scratch. This is a very uncommon feat for a horse to make in this part of the country, but in the Pacific States freed horses travel seventy-five or a hundred miles quite often.—*Hampshire Gazette*, Northampton, Mass.

Furs and Fur-Bearing Animals in Siberia.

R. T. GREENER, United States Commercial Agent, Vladivostok, writes: The fur trade in this province is in a critical condition. Prices have fallen very much, and first-class furs are hard to get. Buyers complain that through the action of some English traders a few years ago in paying extravagant prices to the natives for furs—furs ultimately sold by the buyers at a loss—the regular prices were greatly inflated. Hunters complain that fur-bearing animals are constantly growing scarcer in Siberia.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

One of Canada's Hunting Grounds.

A NUMBER of the habitations of game have been, from time to time, styled "The Sportsman's Paradise," and, while the accounts of these localities have furnished very delightful reading, because of allusions to a great variety of game and its easy acquisition, the enjoyment of their attractions—as in the case of the Paradise of our Sunday School days—is only open to a favored few. Time, that is not heavily scored against by each succeeding set of sun, and a source of "wherewithal" that does not overbearingly demand superintendence, are requisites of these remote fabled lands of plenty, and, therefore, he who is possessed by manias of hunting and fishing, but whose opportunity for indulging them is limited to, say, three weeks in each year, and, furthermore, who must have some regard for the 'tarnal cost of things, is apt to be at a loss to find a place where, during these precious moments of irresponsibility he, a slave to time and penury, can substitute for a bustling city, discordant noises and vitiated air, a slumbering forest, an "audible stillness" as (Thoreau would term it), a vitalizing atmosphere, and, to boot, feel a reasonable certainty of getting a shot at big game.

With the hope of aiding some embryonic or wandering or dissatisfied sportsman (who may take exception to Maine's new law), to a decision for the coming season, either by telling of a retreat that will, or, putting it negatively, will not, appeal to him, we call attention to that little portion of the large Province of Quebec which is almost severed from its moorings by the mighty River St. Lawrence and its tributaries, St. Maurice and Saguenay; a bit of country as picturesque as the views of it from these bordering waters suggest. It is made up of as many hills as its acres will accommodate, for no sooner does one subside than another rises, in an effort to form a larger billow, and in between them all are energetic "little rivers" or deep placid lakes of various sizes and shapes.

There is no vantage point from which to get extended views of this interesting territory, excepting the Terrace in Quebec and occasional rises in the road leading through its sparsely settled clearings, as one drives toward the entrance to its fastnesses, because it is almost completely veiled by woods. Therefore recollections of it must be made up of a mental collection of such landscapes as are revealed to the traveler when he parts the "bush" on arriving at the margin of each succeeding lake and imagines himself the discoverer, because, seemingly, such seclusive quiet and placidity have never been disturbed by the human voice or the canoe paddle.

A wonderfully beautiful and fascinating wilderness, and so orderly withal; never a tree or bough falls but that it is soon concealed by decorative lichens of harmonizing colors; the occasional gaunt and spectral arms of a dead tree are gracefully festooned by waving gray mosses, and the shores of the lakes are bordered so evenly by the vigorous growth of stately fur trees that "waste land" is certainly a misnomer.

No landscape gardener ever produced such effects as these, and in recognition of the rare beauty of this section of country, the Canadian Government has set apart a tract of 2,500 square miles, naming it Laurentides National Park, with the same object as the Algonquin Park of the Province of Ontario and the Yellowstone Park of the United States, viz.: the preservation of game and forests. Adjacent to the Laurentides Park are very many miles of a similar character, some sections of which, occasionally as large as the park itself, are leased by the Government to incorporated fish and game clubs, and this co-operation between the Government and clubs results in a huge game preserve under systematic and thorough patrol, which is open to any licensed sportsman, during the appropriate seasons, who complies with the Government's require-

ments or procures admission into a club's territory.

So, having provided himself with the "open sesame" to the park, to a club preserve or to the unclaimed country nearby, a sportsman may, in the evening of the second day after leaving New York City, sup on trout and sleep under blankets on the edge of a hunting ground combinedly as convenient, promising and inexpensive as can be pointed out on the map of North America.

Owing to the density of the forest hereabouts, it would seem to be impossible to deplete the trout or exterminate the animals and game birds that are indigenous to this latitude, even though no protection were accorded them; and, since there are protective laws, and since they are now enforced with such perseverance and rigor as never before, there is bound to be an increase of fishes, beasts and birds.

A descendant of the Huron tribe of Indians, who has trapped in this vicinity for over forty years, said last autumn that his two months' visit of the preceding winter yielded him over fifty pelts of the bear, otter and marten. Of moose and caribou he saw many, and their wanderings at that season of the year often extend to the bordering settlements.

The timber has never been cut or burned, and when the loud report of a falling tree reverberate through the forest, causing the browsing animals to lift their heads and the hunter to pause and listen with wonderment, it is because it was ripe in years and had precisely fulfilled its lawful functions. They lie as they have fallen, frequently forming stiff hurdles for weary legs and sometimes an abatis, soon to be covered by a pall of the beautiful fungi.

To come upon the alert animals unawares, while scaling these breastworks, is too much to expect, and therefore the only way to get within rifle range is by visiting the lakes or an occasional marsh, where the water-loving beasts disport themselves while browsing on the bordering grasses or overhanging shrubs.

The hunter doesn't have things all his own way, and this uncertainty only serves to intensify his interest and magnify his success. A man versed in woodcraft has been known to have gone into these woods for five successive years without securing a head, notwithstanding the fact that many men with less experience, and some with none, have brought out prizes from the same vicinity in each of these seasons. Inexperienced men sometimes accomplish surprising results because of their greater caution and a more explicit reliance upon instinct when hunting. There was a young fellow down in Maine some years ago who was so green in experience that he did not shoot at a swiftly running deer because he "expected it to break its neck at any minute." He excited mirth among the older sportsmen when he would begin still-hunting the moment he passed from the shadow of the camp, and yet at the end of their respective visits the tenderfoot had bagged more game than any other member of the party.

In the section of country under discussion discouragement is averted by the probable appearance of fresh signs of the moose or caribou in the mornings within short distances of the camp, and at frequent intervals during a day's travel on the portages and around the lake shores. The reading of these marks on the soft vegetable mould is exceedingly interesting, as every woods lover knows, and to have as an associate a guide who is a very Indian and always aware of a recent disturbance of the surface soil, quick to detect the cause as well as the why and wherefore of it, adds much to one's enjoyment of a day's hunt or journey. For instance, a moose track entered the "road" we traveled one day last autumn; it was the mark of a young animal, and he had the start of us by almost two days—so the signs told us. Ere long the boot print of a hunter, with guides in mocassins, also entered the path, and their imprints were just about the same age as those of the animal; but probably the latter was in advance, because the scent of the men's tracks might have driven him from the line of march. For possibly two miles these footprints of men and beast commingled, and we actually entered into the spirit of the chase, so clearly could we imagine the eagerness of the hunter's desire. The trail led us to a lake, where we took to our canoe, and fifty yards from the place of embarkation, on a little point of land, lay the carcass of a young bull moose, with a bullet hole over the heart. His tracks in the sand of the shallow arm of the lake showed where he had halted to browse, and he was probably so engaged when the hunter hove into sight. They saw each other, and as the moose reached the shore line, one well-aimed shot laid him low and the story was told.

With the fisherman visitor there is but one uncertainty—that of the size of the trout. He may have his flies besieged by fingerlings, which sometimes welcome the decorated hook in schools and with surprising gymnastic performances, or he may land the "busting" five-pounder. Throughout this neighborhood the trout seem to have almost exclusive possession of the waters; and while they afford much better sport in June, July and August, they still take the fly quite freely in September, and may be confidently relied upon by the hunter for food.

Partridges, so called, of both varieties, are plentiful, and, like the trout, may always be taken into account when preparing the provision list.

Ducks frequently cross the line of travel, usually in trios, for some reason or other; but several independent groups are frequently found on the same body of water. The ground rises sharply from the lake shores, and as these elevations are very much increased by the surrounding fir trees, the ducks must make three complete circumnavigations of any small lake before attaining a sufficient elevation to clear the obstructions, and the man with a shotgun gets fine sport.

The French-Canadian guides differ in several ways from any others. They are not, generally speaking, such astute hunters as those of Maine and the Adirondacks, and who could expect them to be after seeing the loads they shoulder? They are more of the nature of *couvreurs des bois*, and their pay is on that basis, a dollar and a quarter per day. They carry no weapons

unless the hunting knife and ax may be so called, and this fact serves to concentrate their interest in the sportsman's opportunities. When hunting on their own account they use antiquated "ram-shackle" firearms that are a menace to every living thing in sight. They hold the weapon in a manner calculated to save as many fingers as possible when the explosion comes, and invariably, even at the risk of losing a shot, cross themselves before pulling the trigger. They will guide you to lakes containing many fish or the larger fish, as you prefer, or to the well-known feeding grounds of game, and will there await developments with a keen interest.

It is only an occasional guide who will venture from the blazed trails to find a new lake in unexplored territory, where the scent of human kind has never awakened dread in the senses of the neighboring animals. They have enviable dispositions, are devout, abstemious, possessed of wonderful endurance, and are so generally satisfactory that one feels a hesitancy in meddling with their private affairs by asking them to bathe, even when they, in time, arrive at a parlous stage of gameness. It is not at all surprising that the juvenile and fastidious hunter should have shown signs

TRAVEL IN CANADA.

of indignation when his guide, in a characteristically meek and impersonal manner, diagnosed the escape of the game, "because dey smells you." Another weakness of these individuals is the ceaseless clatter of their French tongues when off duty and in a group. They must repeat themselves many times, for surely there are not enough subjects of conversation under heaven to supply these fellows with material for a two weeks' campaign. One loses patience with their garrulity.

The visitor to this part of the world can take things easy if he chooses and gain in *avoir du poise*, or he can cover more territory and on departure from the forest be in a physical condition that would win the approval of a football coach. In either case, if he becomes possessed of the placid and careless spirit of the woods, he will readily excuse the return to savagery of Darwin's supposed reclaimed Patagonians, for even after a brief period of complete freedom from irritation and care, spent in the rare atmosphere of these Laurentian hills, dressed and shod with almost barbaric simplicity and comfort, a feeling of rebellion accompanies a return to the centers of trade and the prescribed uniform of advanced civilization.

BALTIMORE.

How I Got My First Antelope.

In the fall of 1886 I visited a friend in one of the extreme western counties of Kansas. The surrounding country was then new, having received its first settlers the year before, and it was no uncommon sight to see antelope roaming about. However, I was not favored with a sight of any until one evening, when I got into a buggy with my friend Max to go over eastward on business.

I took my gun, hoping to see some game. The sun was not high, and Max drove rapidly that we might get back before dark. After we had gone perhaps three miles, Max called my attention to some moving objects ahead of us, and on the opposite side of what seemed to be a deep and wide gorge in the plain. The objects were mere specks to us, and I at once suggested that probably we were looking at nothing more uncommon than some settler's barnyard fowl.

However, as we came nearer our hens began to change in appearance, and on coming still nearer, "It is antelope!" cries Max.

"Why, yes," I answer, "why did we not think of that before?" And I grasp my Winchester and raising the rear sight am ready for a long shot. But when I look up, the antelope have passed from sight, for we are going down into a gorge which runs at an angle with and opens into the very one in which we now suspect the antelope are grazing. In the angle between the two gorges is a high ridge which Max thinks I had best climb, for being once at its top, my view will command all shooting range. Max will stay where he is with the buggy until he hears my firing, when he is to drive rapidly around the foot of the ridge.

I become very much excited. Game like this is a new and heretofore entirely unseen thing to me. Eagerly I climb that ridge, and nearing its top, get down on my hands and knees, trailing my gun as best I can. Soon I am at a point from which, peeping over, I can view the whole width of the gorge and its length for a great distance.

But I do not need to look far, for just down below me and not over three-fourths of a city block away from me, and in clear, open sight and grazing quietly, are the antelope—seven of them—beautiful creatures

they are! I can see their eyes distinctly and can almost hear them browse the grass so close are they to me. But I am crouching close to the ground and do not dare to rise, even to a sitting posture, lest I frighten the shy creatures. They do not scent me even now, for the wind, fortunately, is coming from them to me, nor are they likely to see me if I am careful, for I am between them and the setting sun. I am afraid to attempt a shot from here, and looking about for a better position, I notice a large boulder—one about the size of a large dry goods box—sticking itself out of the ground on down the slope toward the antelope perhaps half way. If only I can get behind that rock! Then surely my dreams will come true, for I can rest my rifle on its top and take more certain aim. Besides, I will then be much closer to the game. But to attempt to reach it! Ah, there's the rub! But I must do something for Max is waiting and will not wait long. Hugging my rifle close in my arms I cautiously lie down on the ridge and slowly begin to roll toward that rock, pausing after each turn of the wheel to make sure that the antelope have not sighted me.

After a great many turns and pauses I exult to find myself screened behind that rock. Getting to my feet I lay my rifle across its top and begin casting about for the finest looking antelope. But I am unable to find any difference. All are equally plump.

I sight my gun now at one and now at another. Here is one with its head toward me. Ah, how nicely I could pink him between the eyes! But as I have heard old hunters say that behind the left foreleg is the surest spot, I shall wait until one places himself in position. Of course, when I shoot the game will be mine! No doubt of that! And I glance about for a buggy-way to the place where presently my quarry shall lie. I feel no mistrust of my splendid rifle. Just yesterday I shot several ducks at long distances and missed not once. And, besides, it was offhand; now I have a rest. When I shoot and kill one of these beautiful creatures I shall yet have fifteen shots in my magazine, and most certainly they will not all go amiss as the game scampers away!

Now! See! There is one in position! Quickly I take sight! "Spang!" goes my rifle, and "phiff!" the ball flicks the dust over and beyond where the antelope stood. But the antelope and all its companions are bounding, bunched, up the gorge. Rapidly I fire again and again as they leap away, until all my loads are gone. And I stand dumbfounded at the result: Not an antelope, dead or wounded!

Dumbfounded, now I look at my gun, and now at the antelope, as they stand away across yonder on that high ground and gaze back at me, until Max, having heard my shots, comes driving up the gorge.

"Well!" he says, "how many?"

"None!" I answer, in desperation. "I overshot."

"Look here," he replied, "how are your gun sights?"

Then it flashed over me. I had forgotten to lower the rear sight of the rifle after having raised it for a long-distance shot as we came down in the buggy.

Then I felt as if I had not tasted food for six months and that probably I would never again get my stomach in condition.

WM. J. BECK.

COLUMBUS, Ind.

About Golden Plover.

OMAHA, Neb.—I made mention in a previous letter of the wild ducks' nests found by Dexter L. Thomas on his ranch out in Garfield county a few weeks ago, and of the fact that Mr. Thomas stated that there were more birds breeding this season along the lowlands of the Loup than were ever known before. Yesterday J. D. Brayton, president of the Rock County Bank, at Bassett, this State, was in my office, and he remarked that hundreds of ducks, including canvasbacks, redheads, mallards and about all of our common spring and autumn visitors but the bluebill, had bred about the big rice lakes below Bassett. He said that nothing like it was ever known in that vicinity before and that the citizens of the town drove down there frequently just to watch the birds. Mr. Brayton is a true sportsman, and there are many more like him in his thriving little city, and the nesting birds spoken of were religiously guarded from molestation. Bassett is also the home of Judge J. J. Carlin, probably the best posted naturalist and sportsman in the State. The Judge has made it his personal business to see that the game of Rock county is not unlawfully disturbed, and the consequence is that there is no county in the State where chicken and quail are so plentiful.
